Francesca Perino
What do we have to work with?
Buildings have thermodynamic properties

\[
\frac{\partial u}{\partial t} - \alpha \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) = 0
\]
Temperatures change
Electricity demand varies
Humans have comfort bounds
\[ \frac{\partial u}{\partial t} - \alpha \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) = 0 \]
BuildingIQ Develops Proactive Algorithms for HVAC Energy Optimization in Large-Scale Buildings

Office buildings, hospitals, and other large-scale commercial buildings account for about 30% of the energy consumed worldwide. The heating, ventilation, and air-conditioning (HVAC) systems in these buildings are often inefficient because they do not take into account changing weather patterns, variable energy costs, or the building’s thermal properties.

BuildingIQ has developed Predictive Energy Optimization™ (PEO), a cloud-based software platform that reduces HVAC energy consumption by 10–25% during normal operation. PEO was developed in cooperation with the Commonwealth Scientific and Industrial Research Organisation (CSIRO), HVAC pressure sensors, as well as weather and energy cost data. A single building often produces billions of data points, and the scientists and engineers needed tools for efficiently filtering, processing, and visualizing this data.

To run their optimization algorithms, the scientists and engineers had to create an accurate mathematical model of a building’s thermal and power dynamics. The algorithms would use this calculated model to run constrained optimizations that maintained occupant comfort while minimizing energy costs.

BuildingIQ needed a way to rapidly develop mathematical models, test optimization algorithms, and visualize the results. To meet this need, BuildingIQ deployed MATLAB® on their data center and on premise to improve the performance of their PEO system.

Large-scale commercial buildings can reduce energy costs by 10–25% with BuildingIQ’s energy optimization system.
Traits of Data Analytics applications

BuildingIQ Develops Proactive Algorithms for HVAC Energy Optimization in Large-Scale Buildings

1. Diverse and/or Big Data
Why MATLAB?

1. **Analytics that increasingly require both business and engineering data**

   DATA
   - Engineering, Scientific, and Field
   - Business and Transactional

2. **Enable Domain Experts to be Data Scientists**

3. **Develop embedded systems with analytics powered functionality**

4. **Develop analytics to run on both enterprise and embedded platforms**

   Embedded Systems

Read in engine data

The data used is the sensor readings taken off of the equipment. Maintenance was done after 125 cycles of use, regardless of whether the equipment seemed to need it or not, so we only have the first 125 cycles off of each engine. Our maintenance staff tells us that while some of them were in need of maintenance, many were fine and could have run longer before being serviced. So far no failures have occurred prior to maintenance.

```matlab
sensorData = readtable('train_FD001_Unit_1.csv', 'ReadVariableNames', true);
```

Select relevant variable names

```matlab
variableNames = {'Unit', 'Time', 'LPCOutletTemp', 'HPCOutletTemp', ...
```

Why not transfer all the data?

1. Data privacy concerns
2. Cost of network/storage
3. Power required to transmit data from device (for wireless)
4. Response time
Splitting computation
Smart Systems: Wearable Healthcare Technology

Wearables and Apps Are Shaping the Future of Medical Care

Motion analysis sensors and apps can precisely capture, measure, or record users’ movements. These devices provide doctors, researchers, and patients with biometric data that would otherwise be difficult to collect, such as minute changes in a patient’s breathing pattern, gait, and range of motion.

However, the proliferation of these devices poses a new problem: How do you analyze data collected with wearable technology and ensure that it is being put to good use?

Figure 1: Ubiove sensors in a running test.
Deploying Algorithms to Enterprise Systems

Engineering and IT teams are using MATLAB to build today’s advanced Big Data Analytics systems ranging from predictive maintenance and telematics to advanced driver assistance systems and sensor analytics. Teams select MATLAB because it offers essential capabilities not found in business intelligence systems or open source languages.

Physical-world data: MATLAB has native support for sensor, image, video, telemetry, binary, and other real-time formats. Explore this data using MATLAB MapReduce functionality for Hadoop, and by connecting interfaces to ODBC/JDBC databases.

Machine learning, neural networks, statistics, and beyond: MATLAB offers a full set of statistics and machine learning functionality, plus advanced methods such as nonlinear optimization, system identification, and thousands of prebuilt algorithms for image and video processing, financial modeling, control system design.

High speed processing of large data sets. MATLAB’s numeric routines scale directly to parallel processing on clusters and cloud.
