SimEvents

Description

This block stores entities or messages in a queue, based on the order of arrival or priority. Each element at the head of the queue departs when the downstream block is ready to accept it. The Queue block and the Entity Queue block are the same blocks with different default values for the Overwrite the oldest element if queue is full check box.

You can specify the capacity of the queue, and the policy when the queue is full. The block supports three different message or queue sorting policies, first-in-first out (FIFO), last-in-first out (LIFO), and priority. The priority queue can be used only when the Overwrite the oldest element if queue is full check box is cleared.

Ports

Input

Port_1 — Input entity or message
scalar | vector | matrix

Input entity or message that carries scalar, bus, or vector data to enter the queue.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | enumerated | bus | fixed point

Output

Port_1 — Output entity or message
scalar | vector | matrix
Output port that allows entities or messages at the head of the queue to depart when a downstream block is ready to accept it.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | enumerated | bus | fixed point

**Port_d** — Number of entities that have departed the block
scalar

Number of entities that have departed the block.

**Dependencies**

To enable this port, select Overwrite the oldest element if queue is full check box, and click the Statistics tab and select the box labeled Number of entities departed, d.

Data Types: double

**Port_n** — Number of entities that have not yet departed the block
scalar

Number of entities that have not yet departed the block.

**Dependencies**

To enable this port, select Overwrite the oldest element if queue is full check box, and click the Statistics tab and select the box labeled Number of entities in block, n.

Data Types: double

**Port_w** — Average wait time for entities in the block
scalar

Average wait time for entities in the block.

**Dependencies**

To enable this port, select Overwrite the oldest element if queue is full check box, and click the Statistics tab and select the box labeled Average wait, w.

Data Types: double

**Port_l** — Average length of the entity queue
scalar

Port_l outputs the average length of the entity queue.
Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Average queue length, l**.

Data Types: double

**Port_ex — Number of entities extracted**

scalar

Number of entities that are pulled out of this block.

Dependencies

To enable this port, select **Overwrite the oldest element if queue is full** check box, and click the **Statistics** tab and select the box labeled **Number of entities extracted, ex**.

Data Types: double

Parameters

**Overwrite the oldest element if queue is full — Specify queue overwriting policy**

on (default for Simulink) | off (default for SimEvents)

Select this check box to choose between two queue overwriting policies.

- If you select the check box, an incoming message overwrites the oldest if the queue is full.

  This mode represents a simple message buffer that you can use to generate asynchronous communication between Simulink components and production code.

- If you clear the check box, the block does not accept new messages if the queue is full.

  In this mode, you can manipulate entity data using event actions and visualize statistics.

  To customize actions when entities or messages enter, exit, or are blocked, enter MATLAB code in the **Entry action**, **Exit action**, or **Blocked action** field of the **Event actions** tab. For an example, see “Manage Entities Using Event Actions” (SimEvents).
**Programmatic Use**

**Block Parameter:** QueueOverwriting

- **Type:** character vector
- **Values:** 'on' | 'off'
- **Default:** 'on' (for Simulink) and 'off' (for SimEvents)

**Capacity — Specify the capacity of the queue**

25 (default) | scalar

Specify the capacity of the queue.

**Programmatic Use**

**Block Parameter:** Capacity

- **Type:** character vector
- **Values:** '25' | scalar
- **Default:** '25'

**Queue type — Choose the queue type**

FIFO (default) | LIFO | Priority

Choose the queue type.

- **FIFO** — first-in-first-out
- **LIFO** — last-in-first-out
- **Priority** — store elements in order of priority, see “Sort by Priority” (SimEvents).
  Priority can be selected when you clear the **Overwrite the oldest element if queue is full** check box.

**Note** Priority queue does not support fixed point data type.

**Programmatic Use**

**Block Parameter:** QueueType

- **Type:** character vector
- **Values:** 'FIFO' | 'LIFO' | 'Priority'
- **Default:** 'FIFO'

**Multicast tag — Specify the tag when accepting entities broadcast via multicast sources**

A (default) | character vector
Specify the tag when accepting entities broadcast via multicast sources. The Entity Multicast block requires SimEvents license.

**Dependencies**

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Entity arrival source** to Multicast.

**Programmatic Use**

**Block Parameter**: MulticastTag  
**Type**: character vector  
**Values**: 'A' | character vector  
**Default**: 'A'

**Priority source — Specify which attribute of the entity determines its priority**

Specify which attribute of the entity determines its priority.

**Dependencies**

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Queue type** to Priority.

**Programmatic Use**

**Block Parameter**: PrioritySource  
**Type**: character vector  
**Values**: 'PriorityAttribute' | character vector  
**Default**: 'PriorityAttribute'

**Sorting direction — Choose the direction of sorting based on priority**

Choose the direction of sorting based on priority.

- **Ascending** — Elements with smaller priority values appear in front of the queue.  
- **Descending** — Elements with greater priority values appear in front of the queue.

**Dependencies**

This parameter is visible when you clear the **Overwrite the oldest element if queue is full** check box, and set **Queue type** to Priority.
Programmatic Use
Block Parameter: SortingDirection
Type: character vector
Values: 'Ascending' | 'Descending'
Default: 'Ascending'

Entity arrival source — Choose the source of arrival for the entities
Input port (default) | Multicast

Choose the source of arrival for the entities.

- Input port — Input port is source of messages or entities.
- Multicast — Entity Multicast block is source of entities. The Entity Multicast block requires SimEvents license.

Dependencies

This parameter is visible when you clear the Overwrite the oldest element if queue is full check box, and set Queue type to Priority.

Programmatic Use
Block Parameter: EntityArrivalSource
Type: character vector
Values: 'Input port' | 'Multicast'
Default: 'Input port'

Event action — Specify the behavior of the entity in certain events
Entry (default) | Exit | Blocked

Specify the behavior of the entity in certain events. Define the behavior in the Event action parameter. The Entry and the Exit actions are called just after the entity entry and just before entity exit. The Blocked action is called after an entity is blocked.

Note Event actions do not support fixed point data type.

Dependencies

Event actions are visible when you clear the Overwrite the oldest element if queue is full check box.
Programmatic Use
Block Parameter: EntryAction, ExitAction, BlockedAction
Type: character vector
Values: MATLAB code
Default: ''

Number of entities departed, \(d\) — Outputs the number of entities that have departed the block
off (default) | on

Number of entities that have departed the block.

Dependencies

Number of entities departed, \(d\) is visible when you clear the Overwrite the oldest element if queue is full check box.

Programmatic Use
Block Parameter: NumberEntitiesDeparted
Type: character vector
Values: 'on' | 'off'
Default: 'off'

Number of entities in block, \(n\) — Outputs the number of entities present in the block, that are yet to depart
off (default) | on

Number of entities present in the block, but which are yet to depart.

Dependencies

Number of entities in block, \(n\) is visible when you clear the Overwrite the oldest element if queue is full check box.

Programmatic Use
Block Parameter: NumberEntitiesInBlock
Type: character vector
Values: 'on' | 'off'
Default: 'off'

Average wait, \(w\) — Outputs the average wait time
off (default) | on
Sum of the wait times for entities departing the block divided by their total number. Wait time is the duration between the Entity Queue block entry and exit of an entity. For more information, see “Interpret SimEvents Models Using Statistical Analysis” (SimEvents).

Dependencies

Average wait, \( w \) is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: AverageWait

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Average queue length, \( l \) — Outputs the average length of the entity queue

off (default) | on

Accumulated time-weighted average queue size. The block computes this value by:

1. Multiplying the size of the queue by its duration to calculate time-weighted queue size
2. Summing up all time-weighted queue sizes and averaging them over total time

For more information, see “Interpret SimEvents Models Using Statistical Analysis” (SimEvents).

Dependencies

Average queue length, \( l \) is visible when you clear the **Overwrite the oldest element if queue is full** check box.

Programmatic Use

Block Parameter: AverageQueueLength

Type: character vector

Values: 'on' | 'off'

Default: 'off'

Number of entities extracted, \( ex \) — Number of entities extracted from this block

off (default) | on

Outputs the number of extracted entities which are pulled out from this block by the Entity Find block. The Entity Find block requires a SimEvents license. If the extracted
entity is the first entity in the queue, the next entity is set as the pending entity to leave the block. If an entity attribute defines the priority in a priority queue and it is modified by the Entity Find block, the queue is sorted again. When an entity is extracted, **Number of entities departed**, \( d \), **Number of entities in block**, \( n \), **Average wait**, \( w \), and **Average queue length**, \( l \) statistics are updated accordingly. For more information about finding and extracting entities, see “Find and Extract Entities in SimEvents Models” (SimEvents).

**Dependencies**

**Number of entities extracted**, \( ex \) is visible when you clear the **Overwrite the oldest element if queue is full** check box.

**Programmatic Use**

**Block Parameter**: NumEntitiesExtracted

**Type**: character vector

**Values**: 'on' | 'off'

**Default**: 'off'

Topics
“Behavior and Features of Queues” (SimEvents)

Introduced in R2016a
Radio Button

Select parameter value
Library: Simulink / Dashboard

Description

The Radio Button block lets you change the value of the connected parameter during simulation. You can specify a list of values and labels and then select the value for the parameter from that list. Use the Radio Button block with other Dashboard blocks to build an interactive dashboard of controls and indicators for your model.

Double-clicking the Radio Button block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the Property Inspector, or you can right-click the block and select Block Parameters from the context menu.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using Ctrl+D.
To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.

In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

### Parameter Logging

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`. 
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the Connection table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the Connection table. For example, a block parameter defined as engine(1) using the variable engine does not appear in the table.
  
  To access the parameter in the Connection table, assign the indexed value to a scalar variable, such as engine_1. Then, use the scalar variable to define the block parameter.
- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the Default parameter behavior set to Inlined, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its Gain parameter using the Dashboard blocks, but the Gain value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect
variable and parameter connection options

Select the variable or block parameter to control using the Connection table. Populate the Connection table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click Apply. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using Ctrl+D.

**Programmatic Use**

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a Simulink.HMI.ParamSourceInfo object. The Simulink.HMI.ParamSourceInfo object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** Binding
**Type:** Simulink.HMI.ParamSourceInfo
**Default:** []

**States — Set of states to select for connected parameter**
scalar and character vector

Set of states from which to select a value for the connected parameter. Each State consists of a **State Value** and a **State Label**.

- **State Value** — Value assigned to the connected variable or parameter when you select the state with the corresponding **Label**.
- **State Label** — Label for each state. You can use the **Label** to display the value the connected parameter takes when the switch is positioned at the bottom, or you can enter a descriptive text label.

Click the + button to add additional States.

The default configuration for the block includes these States.
States

<table>
<thead>
<tr>
<th>State Value</th>
<th>State Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Label1</td>
</tr>
<tr>
<td>1</td>
<td>Label2</td>
</tr>
<tr>
<td>2</td>
<td>Label3</td>
</tr>
</tbody>
</table>

Programmatic Use

To programmatically configure the States for a block, use an array of structures containing the fields Value and Label. Include a structure in the array for each state you want to configure on the block.

```matlab
state1.Value = 1;
state1.Label = 'State 1';
state2.Value = 2;
state2.Label = 'State 2';
radioStates = [state1 state2];
```

**Block Parameter:** States  
**Type:** structure  
**Default:** 3x1 structure array

Enumerated Data Type — Specify state values and labels using an enumerated data type

off (default) | on

You can use an enumerated data type that pairs a numeric value with each enumeration to configure the state values and labels for the block. To specify the states for the block using an enumerated data type, first select the **Enumerated Data Type** option. Then, specify the name of the enumerated data type in the text box. The definition for the specified enumerated data type must be saved on the MATLAB path or in the base workspace.

Example: myEnumType

Programmatic Use

To programmatically specify the state labels and values for the block using an enumerated data type, specify 'on' for the **UseEnumeratedDataType** parameter and the name of the enumerated data type for the **EnumeratedDataType** parameter.  
**Block Parameter:** UseEnumeratedDataType
Type: string or character array
Values: 'on' | 'off'
Default: 'off'
Block Parameter: EnumeratedDataType
Type: string or character array
Default: ''

Group Name — Radio Button group name
RadioButtonGroup (default) | character vector

Name for the group of values displayed on the Radio Button block. Unlike the Block Name and Label, the Group Name always shows on the Radio Button block.

Example: Input Amplitude

Programmatic Use
Block Parameter: ButtonGroupName
Type: string or character array
Default: 'Group'

Label — Block label position
Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use
Block Parameter: LabelPosition
Type: character vector
Values: 'Top' | 'Bottom' | 'Hide'
Default: 'Top'

**Introduced in R2017b**
Ramp

Generate constantly increasing or decreasing signal
Library: Simulink / Sources

Description

The Ramp block generates a signal that starts at a specified time and value and changes by a specified rate. The block's Slope, Start time, and Initial output parameters determine the characteristics of the output signal. All must have the same dimensions after scalar expansion.

Ports

Output

Port_1 — Output signal
scalar | vector | matrix

Generated output ramp signal characterized by the Slope, Start time, and Initial output parameters.

Data Types: double

Parameters

Slope — Slope of signal
1 (default) | scalar | vector | matrix

Specify the rate of change of the generated signal.
**Programmatic Use**

**Block Parameter:** `slope`

*Type:* character vector  
*Values:* scalar  
*Default:* `'1'`

**Start time — Time output begins**

0 (default) | scalar

Specify the time at which the block begins generating the signal.

**Programmatic Use**

**Block Parameter:** `start`

*Type:* character vector  
*Values:* scalar  
*Default:* `'0'`

**Initial output — Initial value of output signal**

0 (default) | scalar | vector | matrix

Specify the initial value of the output signal.

**Programmatic Use**

**Block Parameter:** `InitialOutput`

*Type:* character vector  
*Values:* scalar  
*Default:* `'0'`

**Interpret vector parameters as 1-D — Treat vectors as 1-D**

on (default) | off

Select this check box to output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the Constant value parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.
**Type:** character vector
**Values:** 'on' | 'off'
**Default:** 'on'

Pulse Generator | Repeating Sequence

Introduced before R2006a
Random Number

Generate normally distributed random numbers

Library: Simulink / Sources

Description

The Random Number block generates normally distributed random numbers. To generate uniformly distributed random numbers, use the Uniform Random Number block.

You can generate a repeatable sequence using any Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts. By default, the block produces a sequence that has a mean of 0 and a variance of 1. To generate a vector of random numbers with the same mean and variance, specify the Seed parameter as a vector.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the Interpret vector parameters as 1-D check box, and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the Interpret vector parameters as 1-D check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

Port_1 — Output signal

scalar | vector | matrix
Output signal that is the generated random numbers falling within a normal Gaussian distribution. The output is repeatable for a given seed.

Data Types: double

## Parameters

**Mean — Mean of random numbers**

0 (default) | scalar

Specify the mean of the random numbers generated.

**Programmatic Use**

Block Parameter: Mean  
Type: character vector  
Values: scalar  
Default: '0'

**Variance — Variance of random numbers**

1 (default) | scalar

Specify the variance of the random numbers.

**Programmatic Use**

Block Parameter: Variance  
Type: character vector  
Values: scalar  
Default: '1'

**Seed — Starting seed**

0 (default) | positive integer

Specify the starting seed for the random number generator.

The output of number generated is repeatable for a given seed.

**Programmatic Use**

Block Parameter: Seed  
Type: character vector  
Values: scalar  
Default: '0'
Sample time — Time between intervals
0.1 (default) | integer

Specify the time interval between samples. The default is 0.1, which matches the default sample time of the Band-Limited White Noise block. See “Specify Sample Time” in the Simulink documentation for more information.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '0.1'

Interpret vector parameters as 1-D — Treat vectors as 1-D
on (default) | off

Select this check box to output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the Constant value parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.

- When you clear this check box, the block does not output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.

Programmatic Use
Block Parameter: VectorParams1D
Type: character vector
Values: 'on' | 'off'
Default: 'on'

Band-Limited White Noise | Uniform Random Number

Introduced before R2006a
Rate Limiter

Limit rate of change of signal

Library: Simulink / Discontinuities

Description

The Rate Limiter block limits the first derivative of the signal passing through it. The output changes no faster than the specified limit. The derivative is calculated using this equation:

\[ rate = \frac{u(i) - y(i - 1)}{t(i) - t(i - 1)} \]

where \( u(i) \) and \( t(i) \) are the current block input and time, and \( y(i-1) \) and \( t(i-1) \) are the output and time at the previous step. The output is determined by comparing \( rate \) to the **Rising slew rate** and **Falling slew rate** parameters:

- If \( rate \) is greater than the **Rising slew rate** parameter \( (R) \), the output is calculated as
  \[ y(i) = \Delta t \cdot R + y(i - 1). \]
- If \( rate \) is less than the **Falling slew rate** parameter \( (F) \), the output is calculated as
  \[ y(i) = \Delta t \cdot F + y(i - 1). \]
- If \( rate \) is between the bounds of \( R \) and \( F \), the change in output is equal to the change in input:
  \[ y(i) = u(i) \]

When the block is running in continuous mode (for example, **Sample time mode** is inherited and **Sample time** of the driving block is zero), the **Initial condition** is ignored. The block output at \( t = 0 \) is equal to the initial input:

\[ y(0) = u(0) \]
When the block is running in discrete mode (for example, **Sample time mode** is inherited and **Sample time** of the driving block is nonzero), the **Initial condition** is preserved:

\[ y(-1) = I_c \]

where \( I_c \) is the initial condition. The block output at \( t = 0 \) is calculated as if \( \text{rate} \) is outside the bounds of \( R \) and \( F \). For \( t = 0 \), \( \text{rate} \) is calculated as follows:

\[ \text{rate} = \frac{u(0) - y(-1)}{\text{sample time}} \]

**Limitations**

- You cannot use a Rate Limiter block inside a Triggered Subsystem. Use the Rate Limiter Dynamic block instead.

**Ports**

**Input**

**Port_1 — Input signal**

scalar

The input signal to the rate limiter algorithm.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Output**

**Port_1 — Output signal**

scalar

Output signal from the rate limiter algorithm.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
Parameters

**Rising slew rate — Limit of derivative for increasing input**
1 (default) | real number

Specify the limit of the rising rate of the input signal. This parameter is tunable for fixed-point inputs.

**Programmatic Use**
*Block Parameter:* RisingSlewLimit  
*Type:* character vector  
*Values:* real number  
*Default:* '1'

**Falling slew rate — Limit of derivative for decreasing input**
-1 (default) | real number

Specify the lower limit on the falling rate of the input signal. This parameter is tunable for fixed-point inputs.

**Programmatic Use**
*Block Parameter:* FallingSlewLimit  
*Type:* character vector  
*Values:* real number  
*Default:* '-1'

**Sample time mode — Sample time mode**
inherited (default) | continuous

Specify the sample time mode, continuous or inherited from the driving block.

**Programmatic Use**
*Block Parameter:* SampleTimeMode  
*Type:* character vector  
*Values:* 'inherited' | 'continuous' |  
*Default:* 'inherited'

**Initial condition — Initial output**
0 (default) | scalar

Set the initial output of the simulation. Simulink does not allow you to set the initial condition of this block to inf or NaN.
Programmatic Use
Block Parameter: InitialCondition
Type: character vector
Values: scalar
Default: '0'

Treat as gain when linearizing — Specify the gain value
On (default) | Boolean

Select this check box to cause the commands to treat the gain as 1. The linearization commands in Simulink software treat this block as a gain in state space. Clear the box to have the commands treat the gain as 0.

Programmatic Use
Block Parameter: LinearizeAsGain
Type: character vector
Values: 'off' | 'on'
Default: 'on'

Block Characteristics

Rate Limiter Dynamic

Limit rate of change of signal
Library: Simulink / Discontinuities

Description
The Rate Limiter Dynamic block limits the rising and falling rates of the signal.

- The external signal `up` sets the upper limit on the rising rate of the signal.
- The external signal `lo` sets the lower limit on the falling rate of the signal.

Follow these guidelines when using the Rate Limiter Dynamic block:

- Ensure that the data types of `up` and `lo` are the same as the data type of the input signal `u`.

  When the lower limit uses a signed type and the input signal uses an unsigned type, the output signal keeps increasing regardless of the input and the limits.

- Use a fixed-step solver to simulate models that contain this block.

  Because the Rate Limiter Dynamic block supports only discrete sample time.

Ports

Input

`u` — Input signal
scalar

Input signal to the rate limiter algorithm.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
**lo — Limit of derivative for decreasing input**

Scalar

Dynamic value providing the limit of the falling rate of the input signal. Make the signal data type of lo the same data type of the input signal u.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**up — Limit of derivative for increasing input**

Scalar

Dynamic value providing the limit of the rising rate of the input signal. Make the signal data type of up the same data type of the input signal u.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Output**

**Y — Output signal**

Scalar

Output signal from the rate limiter algorithm.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point | enumerated | bus

**Block Characteristics**

Zero-Crossing Detection

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

The code generator does not explicitly group primitive blocks that constitute a nonatomic masked subsystem block in the generated code. This flexibility allows for more efficient code generation. In certain cases, you can achieve grouping by configuring the masked subsystem block to execute as an atomic unit by selecting the Treat as atomic unit option.

PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Design and simulate fixed-point systems using Fixed-Point Designer™.

Rate Limiter

Introduced before R2006a
Rate Transition

Handle transfer of data between blocks operating at different rates
Library: Simulink / Signal Attributes
        HDL Coder / Signal Attributes

Description

The Rate Transition block transfers data from the output of a block operating at one rate to the input of a block operating at a different rate. Use the block parameters to trade data integrity and deterministic transfer for faster response or lower memory requirements. To learn about data integrity and deterministic data transfer, see “Data Transfer Problems” (Simulink Coder).

Transition Handling Options

<table>
<thead>
<tr>
<th>Transition Handling Options</th>

<td>• Ensure data integrity during data transfer</td>
</tr>
<tr>
<td>• Minimum latency</td>
<td></td>
</tr>
<tr>
<td>• Higher memory requirements</td>
<td>Clear:</td>
</tr>
<tr>
<td></td>
<td>• Ensure deterministic data transfer</td>
</tr>
</tbody>
</table>
### Transition Handling Options

- Potential loss of data integrity
- Nondeterministic data transfer
- Minimum latency
- Lower memory requirements

### Block Parameter Settings

<table>
<thead>
<tr>
<th>Clear:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Ensure data integrity during data transfer</td>
</tr>
<tr>
<td>• Ensure deterministic data transfer</td>
</tr>
</tbody>
</table>

### Dependencies

The behavior of the Rate Transition block depends on:

- Sample times of the ports to which the block connects (see “Effects of Synchronous Sample Times” on page 1-1612 and “Effects of Asynchronous Sample Times” on page 1-1613)
- Priorities of the tasks for the source and destination sample times (see “Sample time properties” in the Simulink documentation)
- Whether the model specifies a fixed- or variable-step solver (see “Compare Solvers” in the Simulink documentation)

### Block Labels

When you update your diagram, a label appears on the Rate Transition block to indicate simulation behavior.

<table>
<thead>
<tr>
<th>Label</th>
<th>Block Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZOH</td>
<td>Acts as a zero-order hold</td>
</tr>
<tr>
<td>1/z</td>
<td>Acts as a unit delay</td>
</tr>
<tr>
<td>Buf</td>
<td>Copies input to output under semaphore control</td>
</tr>
<tr>
<td>Db_buf</td>
<td>Copies input to output using double buffers</td>
</tr>
<tr>
<td>3buf</td>
<td>Copies input to output using triple buffers</td>
</tr>
<tr>
<td>Copy</td>
<td>Unprotected copy of input to output</td>
</tr>
<tr>
<td>NoOp</td>
<td>Does nothing</td>
</tr>
<tr>
<td>Mixed</td>
<td>Expands to multiple blocks with different behaviors</td>
</tr>
<tr>
<td>Label</td>
<td>Block Behavior</td>
</tr>
<tr>
<td>-------</td>
<td>----------------</td>
</tr>
<tr>
<td>RT</td>
<td>Indicates data transfer between partitions when using the Schedule Editor. For more information on using the Schedule Editor, see “Using the Schedule Editor”.</td>
</tr>
</tbody>
</table>

The block behavior label shows the method that ensures safe transfer of data between tasks operating at different rates. You can use the sample-time colors feature (see “View Sample Time Information”) to display the relative rates that the block bridges. Consider, for example, the following model:

Sample-time colors and the block behavior label show:

- The Rate Transition block at the top of the diagram acts as a zero-order hold in a fast-to-slow transition.
- The Rate Transition block at the bottom of the diagram acts as a unit delay in a slow-to-fast transition.

For more information, see “Handle Rate Transitions” (Simulink Coder).
## Effects of Synchronous Sample Times

The following table summarizes how each label appears when the sample times of the input and output ports (\(\text{inTs}\) and \(\text{outTs}\)) are periodic, or synchronous.

<table>
<thead>
<tr>
<th>Block Settings</th>

<td></td>
</tr>
<tr>
<td>(\text{inTs} &gt; \text{outTs}) (Slow to fast)</td>
<td>in(\text{Ts} = \frac{\text{outTs}}{N})</td>
<td>1/z</td>
<td>Db_buf</td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{TsOffset}, \text{outTsOffset} = 0)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{Ts} = \frac{\text{outTs}}{N})</td>
<td>None (error)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{TsOffset} \leq \text{outTsOffset})</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{Ts} = \frac{\text{outTs}}{N})</td>
<td>None (error)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{TsOffset} &gt; \text{outTsOffset})</td>
<td>None (error)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>in(\text{Ts} \neq \frac{\text{outTs}}{N})</td>
<td>None (error)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
When you select the **Block reduction** parameter on the Configuration Parameters dialog box, Copy reduces to NoOp. No code generation occurs for a Rate Transition block with a NoOp label. To prevent a block from being reduced when block reduction is on, add a test point to the block output (see “Test Points” in the Simulink documentation).

## Effects of Asynchronous Sample Times

The following table summarizes how each label appears when the sample time of the input or output port (\(\text{inTs}\) or \(\text{outTs}\)) is not periodic, or asynchronous.

<table>
<thead>
<tr>
<th>Block Settings</th>
<th>Block Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\text{inTs} = \text{outTs})</td>
<td>Copy</td>
</tr>
<tr>
<td>(\text{inTs} \neq \text{outTs})</td>
<td>None (error)</td>
</tr>
</tbody>
</table>

**KEY**

- \(\text{inTs}\), \(\text{outTs}\): Sample times of input and output ports, respectively

## Ports

### Input

**Port_1 — Input signal**

- scalar
- vector
- matrix
- N-D array
Input signal to transition to a new sample rate, specified as a scalar, vector, matrix, or N-D array. To learn about the block parameters that enable you to trade data integrity and deterministic transfer for faster response or lower memory requirements, see “Transition Handling Options” on page 1-1609.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1  —  Output signal
scalar | vector | matrix | N-D array

Output signal is the input signal converted to the sample rate you specify. The default configuration ensures safe and deterministic data transfer. To learn about the block parameters that enable you to trade data integrity and deterministic transfer for faster response or lower memory requirements, see “Transition Handling Options” on page 1-1609.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Ensure data integrity during data transfer  —  Ensure data integrity
on (default) | off

Selecting this check box results in generated code that ensures data integrity when the block transfers data. If you select this check box and the transfer is nondeterministic (see Ensure deterministic data transfer), depending on the priority of input rate and output rate, the generated code uses a proper algorithm using single or multiple buffers to protect data integrity during data transfer.

Otherwise, the Rate Transition block is either reduced or generates code using a copy operation to affect the data transfer. This unprotected mode consumes less memory. But the copy operation is also interruptible, which can lead to loss of data integrity during data transfers. Select this check box if you want the generated code to operate with maximum responsiveness (that is, nondeterministically) and data integrity. For more information, see “Rate Transition Block Options” (Simulink Coder).
**Programmatic Use**

**Block Parameter:** Integrity  
*Type:* character vector  
*Values:* `'off'` | `'on'`  
*Default:* `'on'`

**Ensure deterministic data transfer (maximum delay) — Ensure deterministic data transfer**  
*on* (default) | *off*  

Selecting this check box results in generated code that transfers data at the sample rate of the slower block, that is, deterministically. If you do not select this check box, data transfers occur when new data is available from the source block and the receiving block is ready to receive the data. You avoid transfer delays, thus ensuring that the system operates with maximum responsiveness. However, transfers can occur unpredictably, which is undesirable in some applications. For more information, see “Rate Transition Block Options” (Simulink Coder).

**Programmatic Use**

**Block Parameter:** Deterministic  
*Type:* character vector  
*Values:* `'off'` | `'on'`  
*Default:* `'on'`

**Initial conditions — Initial conditions**  
*0* (default) | scalar | vector | matrix | N-D array  

This parameter applies only to slow-to-fast transitions. It specifies the initial output of the Rate Transition block at the beginning of a transition when there is no output from the slow block connected to the input of the Rate Transition block. Simulink does not allow the initial output of this block to be `Inf` or `NaN`. The value you specify must be a scalar, or have the same dimensions as the input signal.

**Programmatic Use**

**Block Parameter:** InitialCondition  
*Type:* character vector  
*Values:* finite scalar  
*Default:* `'0'`

**Output port sample time options — Mode for specifying output port sample time**  
Specify (default)| Inherit | Multiple of input port sample time
Specifies a mode for setting the output port sample time. The options are:

- **Specify** — Allows you to use the **Output port sample time** parameter to specify the output rate to which the Rate Transition block converts its input rate.
- **Inherit** — Specifies that the Rate Transition block inherits an output rate from the block to which the output port is connected.
- **Multiple of input port sample time** — Allows you to use the **Sample time multiple (>0)** parameter to specify the Rate Transition block output rate as a multiple of its input rate.

If you select **Inherit** and all blocks connected to the output port also inherit sample time, the fastest sample time in the model applies.

**Programmatic Use**

**Block Parameter:** OutPortSampleTimeOpt  
**Type:** character vector  
**Values:** 'Specify' | 'Inherit' | 'Multiple of input port sample time'  
**Default:** 'Specify'

**Output port sample time — Output rate**

-1 (default) | scalar | vector

Enter a value that specifies the output rate to which the block converts its input rate. The default value (-1) specifies that the Rate Transition block inherits the output rate from the block to which the output port is connected. See “Specify Sample Time” in the Simulink documentation for information on how to specify the output rate.

**Dependencies**

To enable this parameter, set **Output port sample time options** to Specify.

**Programmatic Use**

**Block Parameter:** OutPortSampleTime  
**Type:** character vector  
**Values:** scalar | vector  
**Default:** '-1'

**Sample time multiple(>0) — Sample time multiple**

1 (default) | positive scalar

Enter a positive value that specifies the output rate as a multiple of the input port sample time. The default value (1) specifies that the output rate is the same as the input rate. A
value of 0.5 specifies that the output rate is half of the input rate. A value of 2 specifies that the output rate is twice the input rate.

**Dependencies**

To enable this parameter, set **Output port sample time options** to **Multiple of input port sample time**.

**Programmatic Use**

**Block Parameter:** OutPortSampleTimeMultiple  
**Type:** character vector  
**Values:** scalar  
**Default:** '1'

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

- Generated code relies on memcpy or memset functions (string.h) under certain conditions
• Cannot use inside a triggered subsystem hierarchy

**HDL Code Generation**

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

**Best Practices**

When the Rate Transition block is operating at a faster input rate and slower output rate, it is good practice to follow the Rate Transition block with a unit delay. Doing so prevents the code generator from inserting an extra bypass register in the HDL code.

See also “Multirate Model Requirements for HDL Code Generation” (HDL Coder).

**HDL Architecture**

This block has a single, default HDL architecture.

**HDL Block Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ConstrainedOutput Pipeline</strong></td>
<td>Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder).</td>
</tr>
<tr>
<td><strong>InputPipeline</strong></td>
<td>Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).</td>
</tr>
<tr>

Real-Imag to Complex

Convert real and/or imaginary inputs to complex signal

Library: Simulink / Math Operations
HDL Coder / Math Operations

Description

The Real-Imag to Complex block converts real and/or imaginary inputs to a complex-valued output signal.

The inputs can both be arrays (vectors or matrices) of equal dimensions, or one input can be an array and the other a scalar. If the block has an array input, the output is a complex array of the same dimensions. The elements of the real input map to the real parts of the corresponding complex output elements. The imaginary input similarly maps to the imaginary parts of the complex output signals. If one input is a scalar, it maps to the corresponding component (real or imaginary) of all the complex output signals.

Ports

Input

Re — Real part of complex output
scalar | vector | matrix

Real value to be converted to complex-valued output signal, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point | bus

Im — Imaginary part of complex output
scalar | vector | matrix
Imaginary value to be converted to complex-valued output signal, specified as a scalar, vector, or matrix.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point` | `bus`

**Port_1 — Real or imaginary part of complex output**

scalar | vector | matrix

Real or imaginary value to convert to complex output signal, specified as a finite scalar, vector, or matrix.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point` | `bus`

**Output**

**Port_1 — Complex signal**

scalar | vector | matrix

Complex signal, formed from real and imaginary values.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fixed point`

**Parameters**

**Input — Real, imaginary, or both**

Real (default) | Imag | Real and imag

Specify the type of input: a real input, an imaginary input, or both.

**Programmatic Use**

**Block Parameter:** Input

**Type:** character vector

**Values:** 'Real and imag' | 'Real' | 'Imag'

**Default:** 'Real and imag'

**Imag part — Imaginary part of complex output**

0 (default) | finite scalar, vector, or matrix
Specify the imaginary value to use when converting the input to a complex-valued output signal.

**Dependencies**

To enable this parameter, set **Input** to **Real**.

**Programmatic Use**

**Block Parameter:** ConstantPart  
**Type:** character vector  
**Values:** imaginary value  
**Default:** '0'

**Real part — Real part of complex output**

0 (default) | finite scalar, vector, or matrix

Specify the constant real value to use when converting the input to a complex-valued output signal.

**Dependencies**

To enable this parameter, set **Input** to **Imag**.

**Programmatic Use**

**Block Parameter:** ConstantPart  
**Type:** character vector  
**Values:** finite, real-valued scalar, vector, or matrix  
**Default:** '0'

**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

**Programmatic Use**

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar or vector
Default: ' -1'

Topics

“Complex Signals”

Introduced before R2006a
Relational Operator

Perform specified relational operation on inputs

Library: Simulink / Commonly Used Blocks
         Simulink / Logic and Bit Operations
         HDL Coder / Commonly Used Blocks
         HDL Coder / HDL Floating Point Operations
         HDL Coder / Logic and Bit Operations

Description

The Relational Operator block performs the specified relational operation on the input. The value you choose for the Relational operator parameter determines whether the block accepts one or two input signals.

Two-Input Mode

By default, the Relational Operator block compares two inputs using the Relational operator parameter that you specify. The first input corresponds to the top input port and the second input to the bottom input port. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.)

You can specify one of the following operations in two-input mode:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>==</td>
<td>True if the first input is equal to the second input</td>
</tr>
<tr>
<td>~=</td>
<td>True if the first input is not equal to the second input</td>
</tr>
<tr>
<td>&lt;</td>
<td>True if the first input is less than the second input</td>
</tr>
<tr>
<td>&lt;=</td>
<td>True if the first input is less than or equal to the second input</td>
</tr>
<tr>
<td>&gt;=</td>
<td>True if the first input is greater than or equal to the second input</td>
</tr>
<tr>
<td>&gt;</td>
<td>True if the first input is greater than the second input</td>
</tr>
</tbody>
</table>

You can specify inputs as scalars, arrays, or a combination of a scalar and an array.
### For...

<table>
<thead>
<tr>
<th>For...</th>
<th>The output is...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalar inputs</td>
<td>A scalar</td>
</tr>
<tr>
<td>Array inputs</td>
<td>An array of the same dimensions, where each element is the result of an element-by-element comparison of the input arrays</td>
</tr>
<tr>
<td>Mixed scalar and array inputs</td>
<td>An array, where each element is the result of a comparison between the scalar and the corresponding array element</td>
</tr>
</tbody>
</table>

The input with the smaller positive range is converted to the data type of the other input offline using round-to-nearest and saturation. This conversion occurs before the comparison.

You can specify the output data type using the **Output data type** parameter. The output equals 1 for true and 0 for false.

**Tip** Select an output data type that represents zero exactly. Data types that satisfy this condition include signed and unsigned integers and any floating-point data type.

### One-Input Mode

When you select one of the following operations for **Relational operator**, the block switches to one-input mode.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isInf</td>
<td>True if the input is Inf</td>
</tr>
<tr>
<td>isNaN</td>
<td>True if the input is NaN</td>
</tr>
<tr>
<td>isFinite</td>
<td>True if the input is finite</td>
</tr>
</tbody>
</table>

For an input that is not floating point, the block produces the following output.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Operation</th>
<th>Block Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed point</td>
<td>isInf</td>
<td>False</td>
</tr>
<tr>
<td>Boolean</td>
<td>isNaN</td>
<td>False</td>
</tr>
<tr>
<td>Built-in integer</td>
<td>isFinite</td>
<td>False</td>
</tr>
</tbody>
</table>
Rules for Data Type Propagation

The following rules apply for data type propagation when your block has one or more input ports with unspecified data types.

<table>
<thead>
<tr>
<th>When the block is in...</th>
<th>And...</th>
<th>The block uses...</th>
</tr>
</thead>

Ports

Input

**Port_1 — First input signal**
scalar | vector | matrix

First input signal, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated

**Port_2 — Second input signal**
scalar | vector | matrix

Second input signal, specified as a scalar, vector, or matrix.

Dependencies

To enable this port, set the Relational operator to ==, ~=, <, <=, >=, or >.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated
**Output**

**Port_1 — Output signal**

scalar | vector | matrix

Output signal, consisting of zeros and ones, with the same dimensions as the input. You control the output data type with the **Output data type** parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated

**Parameters**

**Main**

**Relational operator — Relational operator**

\( \leq \) (default) | \(!=\) | \(==\) | \(<\) | \(\geq\) | \(>\) | isInf | isNaN | isFinite

Specify the operation for comparing two inputs or determining the signal type of one input.

- \(==\) — True if the first input is equal to the second input
- \(!=\) — True if the first input is not equal to the second input
- \(<\) — True if the first input is less than the second input
- \(\leq\) — True if the first input is less than or equal to the second input
- \(\geq\) — True if the first input is greater than or equal to the second input
- \(>\) — True if the first input is greater than the second input
- isInf — True if the input is Inf
- isNaN — True if the input is NaN
- isFinite — True if the input is finite

**Programmatic Use**

**Block Parameter:** Operator

**Type:** character vector

**Values:** '==' | '~=' | '<' | '<=' | '>=' | '>' | 'isInf' | 'isNaN' | 'isFinite'

1-1628
Enable zero-crossing detection — Enable zero-crossing detection
on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

Programmatic Use
Parameter: ZeroCross
Type: character vector, string
Values: 'on' | 'off'
Default: 'on'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies
This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar or vector
Default: '-1'

Data Type

Require all inputs to have the same data type — Require all inputs to have same data type
off (default) | on

To require that all block inputs have the same data type, select this check box. When you clear this check box, the inputs can have different data types.
Dependencies

This check box is not available when you set Relational operator to isInf, isNaN, or isFinite because, in those modes, the block only has one input port.

Programmatic Use

**Block Parameter:** InputSameDT

*Type:* character vector

*Values:* 'off' | 'on'

*Default:* 'off'

**Output data type — Output data type**

boolean (default) | Inherit: Logical (see Configuration Parameters: Optimization) | fixdt(1,16) | <data type expression>

Specify the output data type. When you select:

- **boolean** — The block output has data type boolean.
- **Inherit: Logical (see Configuration Parameters: Optimization)** — The block uses the Implement logic signals as Boolean data configuration parameter to specify the output data type (see “Implement logic signals as Boolean data (vs. double)”).

**Note** This option supports models created before the boolean option was available. Use one of the other options, preferably boolean, for new models.

- **fixdt(1,16)** — The block output has the specified fixed-point data type fixdt(1,16).

**Tip** Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

- **<data type expression>** — The block output has the data type you specify as a data type expression, for example, Simulink.NumericType.

**Tip** To enter a built-in data type (double, single, int8, uint8, int16, uint16, int32, or uint32), enclose the expression in single quotes. For example, enter 'double' instead of double.
Programmatic Use

**Block Parameter:** OutDataTypeStr
**Type:** character vector
**Values:** 'Inherit: Logical (see Configuration Parameters: Optimization)' | 'boolean' | 'fixdt(1,16)' | '<data type expression>'
**Default:** 'boolean'

Integer rounding mode — Rounding mode for fixed-point operations

Specify the rounding mode for fixed-point operations. You can select:

- **Ceiling**
  Rounds positive and negative numbers toward positive infinity. Equivalent to the MATLAB `ceil` function.

- **Convergent**
  Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer `convergent` function.

- **Floor**
  Rounds positive and negative numbers toward negative infinity. Equivalent to the MATLAB `floor` function.

- **Nearest**
  Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer `nearest` function.

- **Round**
  Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer `round` function.

- **Simplest**
  Chooses between rounding toward floor and rounding toward zero to generate rounding code that is as efficient as possible.

- **Zero**
  Rounds number toward zero. Equivalent to the MATLAB `fix` function.

For more information, see “Rounding” (Fixed-Point Designer).
**Programmatic Use**

**Block Parameter:** RndMeth  
**Type:** character vector  
**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'  
**Default:** 'Simplest'

Relay

Switch output between two constants

**Library:**
- Simulink / Discontinuities
- HDL Coder / Discontinuities

**Description**

The output for the Relay block switches between two specified values. When the relay is on, it remains on until the input drops below the value of the **Switch off point** parameter. When the relay is off, it remains off until the input exceeds the value of the **Switch on point** parameter. The block accepts one input and generates one output.

**Note** When the initial input falls *between* the **Switch off point** and **Switch on point** values, the initial output is the value when the relay is off.

**Ports**

**Input**

**Port_1 — Input signal**

*scalar*

The input signal that switches the relay on or off.

*Data Types:* `single`, `double`, `int8`, `int16`, `int32`, `uint8`, `uint16`, `uint32`, `Boolean`, `fixed point`

**Output**

**Port_1 — Output signal**

*scalar*
The output signal switches between two values determined by the parameters **Output when on** and **Output when off**.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

## Parameters

**Switch on point** — Input value which switches the relay on

'eps' (default) | scalar

When the input crosses this threshold, the relay switches on. The **Switch on point** value must be greater than or equal to the **Switch off point**. Specifying a **Switch on point** value greater than the **Switch off point** models hysteresis, whereas specifying equal values models a switch with a threshold at that value.

The **Switch on point** parameter is converted to the input data type offline using round-to-nearest and saturation methods.

**Programmatic Use**

**Block Parameter:** OnSwitchValue

**Type:** character vector

**Values:** scalar

**Default:** 'eps'

**Switch off point** — Input value which switches the relay off

'eps' (default) | scalar

When the input crosses this threshold the relay switches off. The value of **Switch off point** must be less than or equal to **Switch on point**. The **Switch off point** parameter is converted to the input data type offline using round-to-nearest and saturation.

**Programmatic Use**

**Block Parameter:** OffSwitchValue

**Type:** character vector

**Values:** scalar

**Default:** 'eps'

**Output when on** — Output value when the relay is on

1 (default) | scalar

The output value when the relay is on.
Programmatic Use

Block Parameter: OnOutputValue
Type: character vector
Values: scalar
Default: '1'

Output when off — Output value when the relay is off
0 (default) | scalar

The output value when the relay is off.

Programmatic Use

Block Parameter: OffOutputValue
Type: character vector
Values: scalar
Default: '0'

Input processing — Specify sample- or frame-based processing
Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

• Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

• Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).

Use Input processing to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample-based.

<table>
<thead>
<tr>
<th>Input Signal u</th>

<td>Frame based</td>
<td>Yes</td>
</tr>
</tbody>
</table>

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

**Programmatic Use**

**Block Parameter:** InputProcessing  
*Type:* character vector  
*Values:* 'Columns as channels (frame based)' | 'Elements as channels (sample based)'

**Default:** 'Elements as channels (sample based)'

**Enable zero-crossing detection** — **Enable zero-crossing detection**

*on* (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

**Programmatic Use**

**Block Parameter:** ZeroCross  
*Type:* character vector, string  
*Values:* 'off' | 'on'

**Default:** 'on'

**Sample time** — **Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

**Programmatic Use**

**Block Parameter:** SampleTime  
*Type:* character vector  
*Values:* scalar or vector  
**Default:** '-1'
**Output minimum — Minimum output value for range checking**

[ ] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

---

**Programmatic Use**

**Block Parameter:** OutMin  
**Type:** character vector  
**Values:** `'[ ]'` | scalar  
**Default:** `'[ ]'`

---

**Output maximum — Maximum output value for range checking**

[ ] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note**: Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter**: OutMax

**Type**: character vector

**Values**: '[]' | scalar

**Default**: '[]'

**Output data type — Data type of output signal**

Inherit: All ports same datatype (default) | Inherit: Inherit via back propagation | double | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Specify the output data type. You can set it to:

- A rule that inherits a data type, for example, Inherit: Inherit via back propagation
- The name of a built-in data type, for example, single
- The name of a data type object, for example, a Simulink.NumericType object
- An expression that evaluates to a data type, for example, fixdt(1,16,0)

Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the **Output data type** parameter.

See “Control Signal Data Types” in *Simulink User's Guide* for more information.

**Programmatic Use**

**Block Parameter**: OutDataTypeStr

**Type**: character vector

**Values**: 'Inherit: Same as input', 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', etc.
'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0).
'<data type expression>'
Default: 'Inherit: Same as input'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types
off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the data types you specify on this block. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Repeating Sequence

Generate arbitrarily shaped periodic signal
Library: Simulink / Sources

Description

The Repeating Sequence block outputs a periodic scalar signal having a waveform that you specify using the **Time values** and **Output values** parameters. The **Time values** parameter specifies a vector of output times. The **Output values** parameter specifies a vector of signal amplitudes at the corresponding output times. Together, the two parameters specify a sampling of the output waveform at points measured from the beginning of the interval over which the waveform repeats (the period of the signal).

By default, both parameters are `[0 2]`. These default settings specify a sawtooth waveform that repeats every 2 seconds from the start of the simulation and has a maximum amplitude of 2.

Ports

Output

**Port_1 — Periodic output signal**
scalar

Output signal specified by the **Time values** and **Output values** parameters to create a periodic scalar signal.

Data Types: double
Parameters

**Time values — Vector of output times**

Vector of strictly monotonically increasing time values. The period of the generated waveform is the difference of the last and first values of this parameter.

**Programmatic Use**

Block Parameter: rep_seq_t
Type: character vector
Values: vector
Default: [0 2]

**Output values — Vector of output values**

Vector of output values that specify the output waveform. Each element corresponds to the time value in the **Time values** parameter.

**Programmatic Use**

Block Parameter: rep_seq_y
Type: character vector
Values: vector
Default: [0 2]

Block Characteristics

<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>Zero-Crossing Detection</strong></td>
<td>no</td>
</tr>
</tbody>
</table>
Algorithms

The block sets the input period as the difference between the first and last value of the Time values parameter. The output at any time $t$ is the output at time $t = t - n \cdot \text{period}$, where $n$ is an integer. The sequence repeats at $t = n \cdot \text{period}$. The block uses linear interpolation to compute the value of the waveform between the output times that you specify.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code.

Consider using Repeating Sequence Stair or Repeating Sequence Interpolated blocks for code generation.

Repeating Sequence Interpolated | Repeating Sequence Stair

Introduced before R2006a
Repeating Sequence Interpolated

Output discrete-time sequence and repeat, interpolating between data points

Library: Simulink / Sources

Description

The Repeating Sequence Interpolated block outputs a periodic discrete-time sequence based on the values in Vector of time values and Vector of output values parameters. Between data points, the block uses the method you specify for the Lookup Method parameter to determine the output.

Ports

Output

Port_1 — Periodic output signal
scalar

Output signal generated based on the values in the Vector of time values and Vector of output values parameters.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point
Parameters

Main

Vector of output values — Vector of output values
[3 1 4 2 1] (default) | vector

Vector of output values that specify the output waveform. Each element corresponds to the time value in the Vector of time values parameter.

Programmatic Use
Block Parameter: OutValues
Type: character vector
Values: vector
Default: [3 1 4 2 1].'

Vector of time values — Vector of time values
[0 0.1 0.5 0.6 1] (default) | vector

Specify the column vector containing time values. The time values must be strictly increasing, and the vector must have the same size as the vector of output values.

Programmatic Use
Block Parameter: TimeValues
Type: character vector
Values: vector
Default: [0 0.1 0.5 0.6 1].'

Lookup Method — Lookup method for output
Interpolation-Use End Values (default) | Use Input Nearest | Use Input Below | Use Input Above

Specify the lookup method to determine the output between data points.

Programmatic Use
Block Parameter: LookUpMeth
Type: character vector
Values: 'Interpolation-Use End Values' | 'Use Input Nearest' | Use Input Below | Use Input Above
Default: 'Interpolation-Use End Values'
Sample time — Time interval between samples
0.01 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use
Block Parameter: tsamp
Type: character vector
Values: scalar
Default: '0.01'

Signal Attributes

Output minimum — Minimum output value for range checking
[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

Note Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

Programmatic Use
Block Parameter: OutMin
Type: character vector
Values: '[ ]' | scalar
Default: '[]'

**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMax
**Type:** character vector
**Values:** '[]' | scalar
**Default:** '[]'

**Output data type — Specify the output data type**

double (default) | Inherit: Inherit via back propagation | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr
**Type:** character vector
Values: 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'
Default: 'Double'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types
off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Repeating Sequence | Repeating Sequence Stair

Introduced before R2006a
Repeating Sequence Stair

Output and repeat discrete time sequence

Library: Simulink / Sources

Description

The Repeating Sequence Stair block outputs and repeats a stair sequence that you specify with the Vector of output values parameter. For example, you can specify the vector as [3 1 2 4 1]'. A value in Vector of output values is output at each time interval, and then the sequence repeats.
Port_1 — Repeating discrete output signal
scalar
Output signal generated based on the values in the Vector of time values and Sample time parameters.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated
Parameters

Main

Vector of output values — Vector of output values
[3 1 4 2 1].' (default) | vector

Specify the vector containing values of the repeating stair sequence.

Programmatic Use
Block Parameter: OutValues
Type: character vector
Values: vector
Default: [3 1 4 2 1].'

Sample time — Time interval between samples
-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use
Block Parameter: tsamp
Type: character vector
Values: scalar
Default: '-1'

Signal Attributes

Output minimum — Minimum output value for range checking
[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMin

**Type:** character vector

**Values:** '[]' | scalar

**Default:** '[]'

**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

• Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
• Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.
**Programmatic Use**

**Block Parameter:** OutMax

**Type:** character vector

**Values:** ' [ ]' | scalar

**Default:** ' [ ]'

### Output data type — Specify the output data type

double (default) | Inherit: Inherit via back propagation | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

Click the **Show data type assistant** button [ ] to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr

**Type:** character vector

**Values:** 'Inherit: Inherit via back propagation' | 'single' | 'int8' | 'uint8' | int16 | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | fixdt(1,16,0) | fixdt(1,16,2^0,0) | fixdt(1,16,2^0,0) | '<data type expression>'

**Default:** 'Double'

### Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

**Programmatic Use**

**Block Parameter:** LockScale

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

**Reset**

Add reset port to subsystem  
**Library:** Ports & Subsystems

**Description**

A Reset block placed at the root level of a Subsystem block adds a control port to the block. When a reset trigger signal occurs on the signal connected to the port, the block states of the subsystem are reset to their initial condition.

**Parameters**

**Reset trigger type — Select the type of trigger event**  
*level (default)| rising| falling| either| level hold*

Select the type of trigger signal that resets the subsystem block states.

- **level**
  - Reset the block states when the trigger signal is nonzero at the current time step or changes from nonzero at the previous time step to zero at the current time step.

- **rising**
  - Reset the block states when the trigger signal rises from a zero to a positive value or from a negative to a positive value.

- **falling**
  - Reset the block states when the trigger signal falls from a positive value to zero or from a positive to a negative value.

- **either**
  - Reset the block states when the trigger signal changes from a zero to a nonzero value or changes sign.

- **level hold**
  - Reset the block states when the trigger signal is nonzero at the current time step.
Programmatic Use
Block Parameter: ResetTriggerType
Type: character vector
Value: 'level' | 'rising' | 'falling' | 'either' | 'level hold'
Default: 'level'

Propagate sizes of variable-size signals — Select when to propagate a variable-size signal
During execution (default) | Only when enabling

Select when to propagate a variable-size signal.

During execution
Propagate variable-size signals at each time step.

Only when resetting
Propagate variable-size signals when resetting a Subsystem block containing a Reset port block. When you select this option, sample time must be periodic.

Programmatic Use
Block Parameter: PropagateVarSize
Type: character vector
Value: 'During execution' | 'Only when resetting'
Default: 'During execution'

Enable zero-crossing detection — Control zero-crossing detection
on (default) | off

Control zero-crossing detection.

☐ on
Detect zero crossings.

☐ off
Do not detect zero crossings.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector
Value: 'on' | 'off'
Default: 'on'

**Introduced in R2015a**
Reset Function

Executes contents on a model reset event
Library: Simulink / User-Defined Functions

Description

The Reset Function block is a pre-configured subsystem block that executes on a model reset event. By default, the Reset Function block includes an Event Listener block with Event set to Reset, a Constant block with Constant value set to 0, and a State Writer block.

Replace the Constant block with source blocks that generate the state value for the State Writer block.

Conditionally executed subsystem blocks with output ports fully supported within Terminate Function blocks

For a list of unsupported blocks and features, see “Initialize, Reset, and Terminate Function Limitations”.

A model can potentially have multiple Reset Function blocks with each block having a different Event name. Each of these reset events appear in the generated code as a different function.

Resettable Delay

Delay input signal by variable sample period and reset with external signal

**Library:**
- Simulink / Discrete
- HDL Coder / Discrete

**Description**

The Resettable Delay block is a variant of the Delay block that has the source of the initial condition set to **Input port** and the external reset algorithm set to **Rising**, by default.

**Ports**

**Input**

- **u** — Data input signal
  - scalar | vector
  
  Input data signal delayed according to parameters settings.

  **Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point | enumerated | bus

- **d** — Delay length
  - scalar

  Delay length specified as inherited from an input port. Enabled when you select the **Delay length: Source** parameter as **Input port**.

  **Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

- **Enable** — External enable signal
  - scalar
Enable signal that enables or disables execution of the block. To create this port, select the **Show enable port** parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**External reset — External reset signal**

scalar

External signal that resets execution of the block to the initial condition. To create this port, select the **External reset** parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**x0 — Initial condition**

scalar | vector

Initial condition specified as inherited from an input port. Enabled when you select the **Initial Condition: Source** parameter as **Input port**.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Output**

**Port_1 — Output signal**

scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter **Delay length**. The initial value of the output signal depends on several conditions. See “Initial Block Output” on page 1-360.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus
Parameters

Main

Delay length — Delay length
Dialog (default) | Input port

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set Source to Dialog, enter the delay length in the edit field under Value.
- If you set Source to Input port, verify that an upstream signal supplies a delay length for the d input port. You can also specify its maximum value by specifying the parameter Upper limit.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay) casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.

Programmatic Use
Block Parameter: DelayLengthSource
Type: character vector
Values: 'Dialog' | 'Input port'
Default: 'Dialog'
Block Parameter: DelayLength
Type: character vector
Values: scalar
Default: '2'
Block Parameter: DelayLengthUpperLimit
Type: character vector
Values: scalar
Default: '100'

Initial condition — Initial condition
Input port (default) | Dialog

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.
• If you set **Source** to **Dialog**, enter the initial condition in the edit field under **Value**.
• If you set **Source** to **Input port**, verify that an upstream signal supplies an initial condition for the \( x_0 \) input port.

Simulink converts offline the data type of **Initial condition** to the data type of the input signal \( u \) using a round-to-nearest operation and saturation.

**Note** When **State name must resolve to Simulink signal object** is selected on the **State Attributes** pane, the block copies the initial value of the signal object to the **Initial condition** parameter. However, when the source for **Initial condition** is **Input port**, the block ignores the initial value of the signal object.

**Programmatic Use**

**Block Parameter**: InitialConditionSource  
**Type**: character vector  
**Values**: 'Dialog' | 'Input port' |  
**Default**: 'Input Port'

**Block Parameter**: InitialCondition  
**Type**: character vector  
**Values**: scalar  
**Default**: ''

**Input processing — Specify sample- or frame-based processing**

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

• **Columns as channels (frame based)** — Treat each column of the input as a separate channel (frame-based processing).

**Note** Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

• **Elements as channels (sample based)** — Treat each element of the input as a separate channel (sample-based processing).
Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input \( u \). All other input signals must be sample-based.

<table>
<thead>
<tr>
<th>Input Signal ( u )</th>
<th>Input Processing Mode</th>
<th>Block Works?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample based</td>
<td>Sample based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>No, produces an error</td>
</tr>
<tr>
<td>Sample based</td>
<td>Frame based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

**Programmatic Use**

**Block Parameter**: `InputProcessing`  
**Type**: character vector  
**Values**: `'Columns as channels (frame based)'` | `'Elements as channels (sample based)'`  
**Default**: `'Elements as channels (sample based)'`

**Use circular buffer for state — Circular buffer for storing state**

`off` (default) | `on`

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

**Programmatic Use**

**Block Parameter**: `UseCircularBuffer`  
**Type**: character vector  
**Values**: `'off' | 'on'`
**Default:** 'off'

**Prevent direct feedthrough — Prevent direct feedthrough**

off (default) | on

Select to increase the delay length from zero to the lower limit for the *Input processing* mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, u, to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, x0, to the output port.

**Dependency**

To enable this parameter, set *Delay length: Source* to Input port.

**Programmatic Use**

**Block Parameter:** PreventDirectFeedthrough  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Remove delay length check in generated code — Remove delay length out-of-range check**

off (default) | on

Select to remove code that checks for out-of-range delay length.

<table>
<thead>
<tr>
<th>Check Box</th>
<th>Result</th>
<th>When to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>Generated code does not include conditional statements to check for out-of-range delay length.</td>
<td>For code efficiency</td>
</tr>
<tr>
<td>Cleared</td>
<td>Generated code includes conditional statements to check for out-of-range delay length.</td>
<td>For safety-critical applications</td>
</tr>
</tbody>
</table>
Dependency

To enable this parameter, set \textbf{Delay length: Source} to \textit{Input port}.

Programmatic Use

\textbf{Block Parameter:} RemoveDelayLengthCheckInGeneratedCode  
\textbf{Type:} character vector  
\textbf{Values:} 'off' | 'on'  
\textbf{Default:} 'off'

\textbf{Diagnostic for delay length — Diagnostic checks for delay length}

\textbf{None} (default) | Warning | Error

Specify whether to produce a warning or error when the input \textit{d} is less than the lower limit or greater than the \textbf{Delay length: Upper limit}. The lower limit depends on the setting for \textbf{Prevent direct feedthrough}.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:

- \textbf{None} — Simulink software takes no action.
- \textbf{Warning} — Simulink software displays a warning and continues the simulation.
- \textbf{Error} — Simulink software terminates the simulation and displays an error.

Dependency

To enable this parameter, set \textbf{Delay length: Source} to \textit{Input port}.

Programmatic Use

\textbf{Block Parameter:} DiagnosticForDelayLength  
\textbf{Type:} character vector  
\textbf{Values:} 'None' | 'Warning' | 'Error'  
\textbf{Default:} 'None'

\textbf{Show enable port — Create enable port}

\textbf{off} (default) | on

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is 0. The value of the input is checked at the same time step as the block execution.
**Programmatic Use**

**Block Parameter:** `ShowEnablePort`  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**External reset — External state reset**

Specify the trigger event to use to reset the states to the initial conditions.

<table>
<thead>
<tr>
<th>Reset Mode</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>No reset.</td>
</tr>
<tr>
<td>Rising</td>
<td>Reset on a rising edge.</td>
</tr>
<tr>
<td>Falling</td>
<td>Reset on a falling edge.</td>
</tr>
<tr>
<td>Either</td>
<td>Reset on either a rising or falling edge.</td>
</tr>
<tr>
<td>Level</td>
<td>Reset in either of these cases:</td>
</tr>
<tr>
<td></td>
<td>• when the reset signal is nonzero at the current time step</td>
</tr>
<tr>
<td></td>
<td>• when the reset signal value changes from nonzero at the previous time step to zero at the current time step</td>
</tr>
<tr>
<td>Level hold</td>
<td>Reset when the reset signal is nonzero at the current time step</td>
</tr>
</tbody>
</table>

The reset signal must be a scalar of type `single`, `double`, `boolean`, or `integer`. Fixed point data types, except for `ufix1`, are not supported.

**Programmatic Use**

**Block Parameter:** `ExternalReset`  
**Type:** character vector  
**Values:** 'None' | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'  
**Default:** 'Rising'

**Sample time (-1 for inherited) — Discrete interval between sample time hits**

-1 (default) | scalar
Specify the time interval between samples. To inherit the sample time, set this parameter to -1. This block supports discrete sample time, but not continuous sample time.

**Programmatic Use**

**Block Parameter:** SampleTime

**Type:** character vector  
**Value:** real scalar  
**Default:** '-1'

**State Attributes**

**State name — Unique name for block state**

'' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ''. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

**Programmatic Use**

**Block Parameter:** StateName

**Type:** character vector  
**Values:** unique name  
**Default:** ''

**State name must resolve to Simulink signal object — Require state name resolve to a signal object**

off (default) | on

Select this check box to require that the state name resolves to a Simulink signal object.
Dependencies

To enable this parameter, specify a value for State name. This parameter appears only if you set the model configuration parameter Signal resolution to a value other than None.

Selecting this check box disables Code generation storage class.

Programmatic Use

Block Parameter: StateMustResolveToSignalObject

Type: character vector

Values: 'off' | 'on'

Default: 'off'

Signal object class — Custom storage class package name

Simulink.Signal (default)|<StorageClass.PackageName>

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package mpt, select mpt.Signal. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select Customize class lists.

For instructions, see “Target Class Does Not Appear in List of Signal Object Classes” (Embedded Coder).

For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Programmatic Use

Block Parameter: StateSignalObject

Type: character vector

Values: 'Simulink.Signal' | '<StorageClass.PackageName>'

Default: 'Simulink.Signal'

Code generation storage class — State storage class for code generation

Auto (default)|Model default|ExportedGlobal|ImportedExtern|
ImportedExternPointer|BitField (Custom)|Model default|ExportToFile (Custom)|ImportFromFile (Custom)|FileScope (Custom)|AutoScope (Custom)|Struct (Custom)|GetSet (Custom)|Reusable (Custom)

Select state storage class for code generation.
• **Auto** is the appropriate storage class for states that you do not need to interface to external code.

• **StorageClass** applies the storage class or custom storage class that you select from the list. For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than Simulink.

**Dependencies**

To enable this parameter, specify a value for **State name**.

**Programmatic Use**

**Block Parameter:** StateStorageClass  
**Type:** character vector  
**Values:** 'Auto' | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...  
**Default:** 'Auto'

Topics
“Using Enabled Subsystems”

Introduced in R2012b
**Resettable Subsystem**

Subsystem whose block states reset with external trigger  
**Library:** Simulink / Ports & Subsystems

**Description**

The Resettable Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that resets the block states each time the control port receives a trigger signal.

**Ports**

**Input**

In — **Signal input to a subsystem block**  
scalar | vector | matrix

Placing an Inport block in a Subsystem block adds an external input port to the block. The port label matches the name of the Inport block.
Use Inport blocks to receive signals from the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Reset — Control signal input to a subsystem block**
scalar | vector | matrix

Placing a Reset block in a Subsystem block adds an external input port to the block and changes the block to a Resettable Subsystem block.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**Out — Signal output from a subsystem**
scalar | vector | matrix

Placing an Outport block in a Subsystem block adds an output port from the block. The port label on the Subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Introduced in R2015a**
Reshape

Change dimensionality of signal

Library: Simulink / Math Operations
HDL Coder / Math Operations

Description

The Reshape block changes the dimensionality of the input signal to a dimensionality that you specify, using the **Output dimensionality** parameter. For example, you can use the block to change an $N$-element vector to a 1-by-$N$ or $N$-by-1 matrix signal.

Ports

Input

**Port_1 — Input signal**
scalar | vector | matrix

Input signal whose dimensions are changed based on the **Output dimensionality** parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

**Port_1 — Output signal**
scalar | vector | matrix

Output signal created with the dimensions specified in the **Output dimensionality** parameter.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 |
Boolean | fixed point | enumerated | bus

Parameters

Output dimensionality — Dimensions of output signal
1-D array (default) | Column vector (2-D) | Row vector (2-D) | Customize |
Derive from reference input port

Specify the dimensionality of the output signal.

<table>
<thead>
<tr>
<th>Output Dimensionality</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-D array</td>
<td>Converts a multidimensional array to a vector (1-D array) array signal. The output vector consists of the first column of the input matrix followed by the second column, and so on. (This option leaves a vector input unchanged.)</td>
</tr>
<tr>
<td>Column vector</td>
<td>Converts a vector, matrix, or multidimensional input signal to a column matrix, a $M$-by-$1$ matrix, where $M$ is the number of elements in the input signal. For matrices, the conversion is done in column-major order. For multidimensional arrays, the conversion is done along the first dimension.</td>
</tr>
<tr>
<td>Row vector</td>
<td>Converts a vector, matrix, or multidimensional input signal to a row matrix, a $1$-by-$N$ matrix where $N$ is the number of elements in the input signal. For matrices, the conversion is done in column-major order. For multidimensional arrays, the conversion is done along the first dimension.</td>
</tr>
<tr>
<td>Customize</td>
<td>Converts the input signal to an output signal whose dimensions you specify, using the <strong>Output dimensions</strong> parameter.</td>
</tr>
<tr>
<td>Derive from reference input port</td>
<td>Creates a second input port, <strong>Ref</strong>, on the block. Derives the dimensions of the output signal from the dimensions of the signal input to the Ref input port. Selecting this option disables the <strong>Output dimensions</strong> parameter. When you select this parameter, the input signals for both inport ports, <strong>U</strong> and <strong>Ref</strong>, must have the same sampling mode (sample-based or frame-based).</td>
</tr>
</tbody>
</table>
Programmatic Use
Block Parameter: OutputDimensionality
Type: character vector
Value: '1-D array' | 'Column vector (2-D)' | 'Row vector (2-D)' |
'Customize' | 'Derive from reference input port'
Default: '1-D array'

Output dimensions — Custom dimensions of output signal
[1,1] (default) | [integer] | [integer,integer]

Specify the dimensions for the output signal. The value can be a one- or multi-element vector. A value of [N] outputs a vector of size N. A value of [M N] outputs an M-by-N matrix. The number of elements of the input signal must match the number of elements specified by the Output dimensions parameter. For multidimensional arrays, the conversion is done along the first dimension.

Dependency
To enable this parameter, set Output dimensionality to Customize.

Programmatic Use
Block Parameter: OutputDimensions
Type: character vector
Value: ' [integer,integer]' |
Default: ' [1,1]'

Rocker Switch

Toggle parameter between two values

Library: Simulink / Dashboard

Description

The Rocker Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Rocker Switch block to a Switch block in your model and change its state during simulation. Use the Rocker Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Rocker Switch block does not open its dialog box during simulation and when the block is selected. To edit the block’s parameters, you can use the Property Inspector, or you can right-click the block and select Block Parameters from the context menu.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.
**Note** Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using **Ctrl+D**.

To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.

In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the Exit button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

**Parameter Logging**

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`. 
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the Connection table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the Connection table. For example, a block parameter defined as `engine(1)` using the variable `engine` does not appear in the table.

To access the parameter in the Connection table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the Default parameter behavior set to Inlined, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its Gain parameter using the Dashboard blocks, but the Gain value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect variable and parameter connection options

Select the variable or block parameter to control using the Connection table. Populate the Connection table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click **Apply**. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

---

**Programmatic Use**

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** Binding  
**Type:** `Simulink.HMI.ParamSourceInfo`  
**Default:** `[]`

**States — Pair values and labels**

Scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Top** and **Bottom** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

**States**

<table>
<thead>
<tr>
<th>Position</th>
<th>State Value</th>
<th>State Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top</td>
<td>0</td>
<td>on</td>
</tr>
<tr>
<td>Bottom</td>
<td>1</td>
<td>off</td>
</tr>
</tbody>
</table>
Programmatic Use

To configure the States for the block programmatically, specify the value of the States parameter as a structure array containing two elements with fields:

- Value — Scalar double value for the state.
- Label — String or character array to use as the label for the switch position.

```matlab
topState.Value = 0;
topState.Label = 'Off';
bottomState.Value = 1;
bottomState.Label = 'On';
switchStates = [topState bottomState];
```

**Block Parameter: States**

**Type:** two element array of structures

**Label — Block label position**

Top (default) | Bottom | Hide

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

**Programmatic Use**

**Block Parameter:** LabelPosition

**Type:** character vector

**Values:** 'Top' | 'Bottom' | 'Hide'

**Default:** 'Top'

Rotary Switch

Switch parameter to set values on dial
Library: Simulink / Dashboard

Description

The Rotary Switch changes the value of the connected block parameter to several specified values during simulation. For example, you can connect the Rotary Switch block to the amplitude or frequency of an input signal in your model and change its characteristics during simulation. Use the Rotary Switch block with other Dashboard blocks to create an interactive dashboard to control your model.

Double-clicking the Rotary Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the Property Inspector, or you can right-click the block and select Block Parameters from the context menu.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.
Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using Ctrl+D.

To enter connect mode, click the Connect button that appears above your unconnected Dashboard block when you pause on it.

In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the Connect button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

**Parameter Logging**

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`. 

1-1693
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the Connection table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the Connection table. For example, a block parameter defined as engine(1) using the variable engine does not appear in the table.

To access the parameter in the Connection table, assign the indexed value to a scalar variable, such as engine_1. Then, use the scalar variable to define the block parameter.

- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the Default parameter behavior set to Inlined, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its Gain parameter using the Dashboard blocks, but the Gain value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect
variable and parameter connection options

Select the variable or block parameter to control using the Connection table. Populate the Connection table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click **Apply**. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

**Programmatic Use**

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** Binding  
**Type:** `Simulink.HMI.ParamSourceInfo`  
**Default:** `[]`

**States — Position labels and values**

`scalar and character vector`

Pairs of numeric values to assign to the connected variable or parameter with labels for the block. A State consists of a **State Value** and a **State Label**.

- **State Value** — Value assigned to the connected variable or parameter when the Rotary Switch block is positioned at the corresponding **State Label**.
- **State Label** — Label for the switch position. You can use the **State Label** to display the value the connected variable or parameter takes when the Rotary Switch block points to the **State Label**, or you can use a descriptive text label.

Click the + button to add **States**.

The default configuration for the block includes these **States**:
**States**

<table>
<thead>
<tr>
<th>State Value</th>
<th>State Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Off</td>
</tr>
<tr>
<td>1</td>
<td>Low</td>
</tr>
<tr>
<td>2</td>
<td>Medium</td>
</tr>
<tr>
<td>3</td>
<td>High</td>
</tr>
</tbody>
</table>

**Programmatic Use**

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

Include a structure element in the array for each state you want to specify for the block.

```matlab
state1.Value = 1;
state1.Label = 'State 1';
state2.Value = 2;
state2.Label = 'State 2';
states = [state1 state2];
```

**Block Parameter:** States  
**Type:** structure array

**Enumerated Data Type — Specify state values and labels using an enumerated data type**  
*off* (default) | *on*

You can use an enumerated data type that pairs a numeric value with each enumeration to configure the state values and labels for the block. To specify the states for the block using an enumerated data type, first select the **Enumerated Data Type** option. Then, specify the name of the enumerated data type in the text box. The definition for the specified enumerated data type must be saved on the MATLAB path or in the base workspace.

**Example:** `myEnumType`
**Programmatic Use**

To programatically specify the state labels and values for the block using an enumerated data type, specify 'on' for the UseEnumeratedDataType parameter and the name of the enumerated data type for the EnumeratedDataType parameter.

**Block Parameter:** UseEnumeratedDataType

- **Type:** string or character array
- **Values:** 'on' | 'off'
- **Default:** 'off'

**Block Parameter:** EnumeratedDataType

- **Type:** string or character array
- **Default:** ''

**Label — Block label position**

- **Top** (default) | **Bottom** | **Hide**

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

**Programmatic Use**

**Block Parameter:** LabelPosition

- **Type:** character vector
- **Values:** 'Top' | 'Bottom' | 'Hide'
- **Default:** 'Top'

Introduced in R2015a
**Rounding Function**

Apply rounding function to signal  
**Library:** Simulink / Math Operations

**Description**

The Rounding Function block rounds each element of the input signal to produce the output signal.

You select the type of rounding from the **Function** parameter list. The name of the selected function appears on the block.

**Tip** Use the Rounding Function block when you want vector or matrix output.

**Ports**

**Input**

**Port_1 — Input signal**  
scalar | vector | matrix

Input signal to which the rounding function is applied.

Data Types: single | double

**Output**

**Port_1 — Output signal**  
scalar | vector | matrix
Output signal after the rounding function is applied to the input signal. The output signal has the same dimensions and data type as the input. Each element of the output signal is the result of applying the selected rounding function to the corresponding element of the input signal.

**Data Types:** single | double

### Parameters

**Function — Rounding function**

floor (default) | ceil | round | fix

Choose the rounding function applied to the input signal.

<table>
<thead>
<tr>
<th>Rounding function</th>
<th>Rounds each element of the input signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>floor</td>
<td>To the nearest integer value towards minus infinity</td>
</tr>
<tr>
<td>ceil</td>
<td>To the nearest integer towards positive infinity</td>
</tr>
<tr>
<td>round</td>
<td>To the nearest integer</td>
</tr>
<tr>
<td>fix</td>
<td>To the nearest integer towards zero</td>
</tr>
</tbody>
</table>

**Programmatic Use**

**Block Parameter:** Operator

**Type:** character vector

**Values:** 'floor' | 'ceil' | 'round' | 'fix'

**Default:** 'floor'

**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.
Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar or vector
Default: '-1'

Saturation

Limit input signal to the upper and lower saturation values

**Library:**
- Simulink / Commonly Used Blocks
- Simulink / Discontinuities
- HDL Coder / Discontinuities

**Description**

The Saturation block produces an output signal that is the value of the input signal bounded to the upper and lower saturation values. The upper and lower limits are specified by the parameters **Upper limit** and **Lower limit**.

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower limit ≤ Input value ≤ Upper limit</td>
<td>Input value</td>
</tr>
<tr>
<td>Input value &lt; Lower limit</td>
<td>Lower limit</td>
</tr>
<tr>
<td>Input value &gt; Upper limit</td>
<td>Upper limit</td>
</tr>
</tbody>
</table>

**Ports**

**Input**

**Port_1 — Input signal**

Scalar | Vector

The input signal to the saturation algorithm.

Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
Output

Port_1 — Output signal
scalar | vector

Output signal that is the value of the input signal, upper saturation limit, or lower saturation limit.

Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

Main

Upper limit — Upper saturation boundary for the input signal
0.5 (default) | scalar | vector

Specify the upper bound on the input signal. If the input signal is greater than this boundary, then the output signal is set to this saturation value. The Upper limit parameter is converted to the output data type using round-to-nearest and saturation. Upper limit must be greater than the Output minimum parameter and less than the Output maximum parameter.

Programmatic Use
Block Parameter: UpperLimit
Type: character vector
Value: real scalar or vector
Default: '0.5'

Lower limit — Lower saturation boundary for the input signal
-0.5 (default) | scalar | vector

Specify the lower bound on the input signal. If the input signal is less than this boundary, then the output signal is set to this saturation value. The Lower limit parameter is converted to the output data type using round-to-nearest and saturation. Lower limit must be greater than the Output minimum parameter and less than the Output maximum parameter.
Programmatic Use
Block Parameter: LowerLimit
Type: character vector
Value: real scalar or vector
Default: '-0.5'

Treat as gain when linearizing — Specify the gain value
On (default) | Boolean

Select this check box to cause the commands to treat the gain as 1. The linearization commands in Simulink software treat this block as a gain in state space. Clear the box to have the commands treat the gain as 0.

Programmatic Use
Block Parameter: LinearizeAsGain
Type: character vector
Values: 'off' | 'on'
Default: 'on'

Enable zero-crossing detection — Enable zero-crossing detection
on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector, string
Values: 'off' | 'on'
Default: 'on'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.
**Signal Attributes**

Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Output minimum — Minimum output value for range checking**

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** `OutMin`

**Type:** character vector

**Values:** '[]' | scalar

**Default:** '[ ]'
Output maximum — Maximum output value for range checking

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMax

**Type:** character vector

**Values:** '[]' | scalar

**Default:** '[]'

Output data type — Specify the output data type

Inherit: Same as input (default) | Inherit: Inherit via back propagation | double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr

**Type:** character vector

**Values:** 'Inherit: Same as input', 'Inherit: Inherit via back propagation', 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32',...
'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0).
'<data type expression>'
**Default**: 'Inherit: Same as input'

**Lock output data type setting against changes by the fixed-point tools** — Prevent fixed-point tools from overriding Output data type

*off* (default) | *on*

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

**Programmatic Use**

**Block Parameter**: LockScale

**Type**: character vector

**Values**: 'off' | 'on'

**Default**: 'off'

**Integer rounding mode** — Specify the rounding mode for fixed-point operations

*Floor* (default) | *Ceiling* | *Convergent* | *Nearest* | *Round* | *Simplest* | *Zero*

Choose one of these rounding modes.

**Ceiling**

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB **ceil** function.

**Convergent**

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer **convergent** function.

**Floor**

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB **floor** function.

**Nearest**

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer **nearest** function.

**Round**

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer **round** function.
Simplest
Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero
Rounds number toward zero. Equivalent to the MATLAB fix function.

**Programmatic Use**
**Block Parameter:** `RndMeth`
**Type:** character vector
**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
**Default:** 'Floor'

**See Also**
For more information, see “Rounding” (Fixed-Point Designer).

Saturation Dynamic

Limit input signal to dynamic upper and lower saturation values

**Library:**
- Simulink / Discontinuities
- HDL Coder / Discontinuities

**Description**

The Saturation Dynamic block produces an output signal that is the value of the input signal bounded to the saturation values from the input ports `up` and `lo`.

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lo ≤ Input value ≤ hi</code></td>
<td>Input value</td>
</tr>
<tr>
<td><code>Input value &lt; lo</code></td>
<td>Lower limit</td>
</tr>
<tr>
<td><code>Input value &gt; hi</code></td>
<td>Upper limit</td>
</tr>
</tbody>
</table>

**Ports**

**Input**

* `u` — Input signal
  scalar | vector

The input signal to the saturation algorithm.

* Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

* `up` — Signal that provides the upper saturation limit
  scalar | vector

Dynamic value providing the upper saturation limit. When the input is greater than `up` then the output value is bound to `up`.
Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

lo — Signal that provides the lower saturation limit
scalar | vector

Dynamic value providing the lower saturation limit. When the input is less than lo then the output value is bound to lo.

Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Output 1 — Output signal
scalar | vector

Output signal that is the value of the input signal, upper saturation limit, or lower saturation limit.

Data Types: double | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

To edit the parameters for the Saturation Dynamic block, double-click the block icon.

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Output minimum — Minimum output value for range checking
[ ] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
• Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMin

**Type:** character vector

**Values:** '[]' | scalar

**Default:** '[]'

**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

• Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
• Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.
Programmatic Use
Block Parameter: OutMax
Type: character vector
Values: '[ ]' | scalar
Default: '[ ]'

Output data type — Specify the output data type
Inherit: Same as input (default) | Inherit: Inherit via back propagation |
double | single | int8 | int32 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) |
<data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or
expressed as a data type object such as Simulink.NumericType.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: 'Inherit: Same as input', 'Inherit: Inherit via back
propagation', 'single', 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32',
'int64', 'uint64', 'fixdt(1,16,0)', 'fixdt(1,16,2^0,0)', 'fixdt(1,16,2^0,0).'
'<data type expression>'
Default: 'Inherit: Same as input'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type
off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the Output data
type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.
Ceiling
Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB ceil function.

Convergent
Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer convergent function.

Floor
Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB floor function.

Nearest
Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer nearest function.

Round
Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer round function.

Simplest
Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero
Rounds number toward zero. Equivalent to the MATLAB fix function.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

See Also

For more information, see “Rounding” (Fixed-Point Designer).

Saturation on integer overflow — Choose the behavior when integer overflow occurs
on (default) | boolean
<table>
<thead>
<tr>
<th>Action</th>
<th>Reasons for Taking This Action</th>
<th>What Happens for Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box.</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Do not select this check box.</td>
<td>You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.
Programmatic Use

**Block Parameter:** SaturateOnIntegerOverflow  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'on'

Introduced before R2006a
Scan String

Scan input string and convert to signals per specified format
Library: Simulink / String

Description

The Scan String block scans an input string and converts it to signals per the format specified by the Format parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. Use this block when you want to deconstruct a string, for example a sentence, into its individual components. For example, if the Format parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

Note If you specify a numeric display format that is not large enough to display all the digits of a value, the displayed values may lose precision. The result depends on your computer hardware and operating system.

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the Configuration Parameters > Code Generation > Interface > Support non-finite numbers check box.
Ports

Input

Port_1 — Input string
scalar
Input string, specified as a scalar.
Data Types: string

Output

d — Output data whose format matches %d format
scalar
Output data whose format matches the specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in Format, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

f — Output data whose format matches %f format
scalar
Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port_N — Output data whose format matches N format
scalar
Output data whose format matches $N$ format, specified as a scalar. Total maximum number of outputs is 128.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

**Format — Format operator for input**
"%d %f" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the `sscanf` function return, which is an empty matrix if the function cannot match the input with the specified format.

- For the String to Double block, this parameter has a default value of %lf.
- For the String to Single block, this parameter has a default value of %f.

For more information about acceptable format operators, see the Algorithms section.

Block Characteristics

</tbody>
</table>

Algorithms

The Scan String block uses this format specifier prototype:

```
%[width][length]specifier
```
### Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

<table>
<thead>
<tr>
<th>Output Port Data Type</th>
<th>Conversion Specifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer, signed</td>
<td>%d</td>
<td>Base 10</td>
</tr>
<tr>
<td>Integer, unsigned</td>
<td>%u</td>
<td>Base 10</td>
</tr>
<tr>
<td>Floating-point number</td>
<td>%f, %e, or %g</td>
<td>Floating-point values. Input fields can contain NaN (case sensitive). Input fields that represents floating-point numbers can include leading + or - symbols and exponential notation using e or E. The conversion specifiers %f, %e, and %g all treat input fields the same way.</td>
</tr>
</tbody>
</table>

### Character Fields

This table lists available conversion specifiers to convert text so that the output is a string.

<table>
<thead>
<tr>
<th>Character Field Type</th>
<th>Conversion Specifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String scalar</td>
<td>%s</td>
<td>Read the text until the block encounters whitespace.</td>
</tr>
<tr>
<td></td>
<td>%c</td>
<td>Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, %10c reads 10 characters at a time.</td>
</tr>
<tr>
<td>Character Field Type</td>
<td>Conversion Specifier</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Pattern-matching</td>
<td>%[...]</td>
<td>Read only the characters in the brackets up to the first nonmatching character or whitespace. Example: %[mus] reads 'summer' as 'summ'.</td>
</tr>
<tr>
<td></td>
<td>%[^...]</td>
<td>Read any characters not in the brackets up to the first matching character or whitespace. Example: %[^m] reads 'summer' as 'su'.</td>
</tr>
</tbody>
</table>

**Optional Operators**

- **Field Width** — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, %10s reads up to 10 characters at a time, including whitespace. %4f reads up to four digits at a time, including the decimal point.

- **Literal Text to Ignore** — This block must match the specified text immediately before or after the conversion specifier.

  Example: Hell%s reads "Hello!" as "o!".

**Length Specifiers**

The Scan String block supports the h and l length subspecifiers. These specifiers can change according to the Configuration Parameters > Hardware Implementation > Number of bits settings.

<table>
<thead>
<tr>
<th>Length</th>
<th>i</th>
<th>u</th>
<th>f e g</th>
<th>s c [...]</th>
<th>^...</th>
</tr>
</thead>
<tbody>
<tr>
<td>No length specifier</td>
<td>int</td>
<td>unsigned int</td>
<td>single</td>
<td>string</td>
<td></td>
</tr>
<tr>
<td>h</td>
<td>short</td>
<td>unsigned short</td>
<td>—</td>
<td>—</td>
<td></td>
</tr>
<tr>
<td>l</td>
<td>long</td>
<td>unsigned long</td>
<td>double</td>
<td>—</td>
<td></td>
</tr>
</tbody>
</table>
Notes for Specifiers that Specify Integer Data Types (d, u)

• Target int, long, and short type sizes are controlled by settings in the Configuration Parameters > Hardware Implementation pane. For example, if the target int is 32 bits and the specifier is %u, then the expected input type will be uint32. For this example, the Scan String block requires that the output type be exactly int32. It cannot be any other data type.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Introduced in R2018a
Scope, Time Scope

Display signals generated during simulation

**Library:**
- Simulink / Commonly Used Blocks
- Simulink / Sinks
- HDL Coder / Commonly Used Blocks
- HDL Coder / Sinks

**Description**

The Simulink Scope block and DSP System Toolbox Time Scope block display time domain signals.
The two blocks have identical functionality, but different default settings. The Time Scope is optimized for discrete time processing. The Scope is optimized for general time-domain simulation. For a side-by-side comparison, see “Simulink Scope Versus DSP System Toolbox Time Scope”.

Oscilloscope features:

- Triggers — Set triggers to sync repeating signals and pause the display when events occur.
- Cursor Measurements — Measure signal values using vertical and horizontal cursors.
- Signal Statistics — Display the maximum, minimum, peak-to-peak difference, mean, median, and RMS values of a selected signal.
- Peak Finder — Find maxima, showing the x-axis values at which they occur.
- Bilevel Measurements — Measure transitions, overshoots, undershoots, and cycles.

You must have a Simscape or DSP System Toolbox license to use the Peak Finder, Bilevel Measurements, and Signal Statistics.

Scope display features:

- Simulation control — Debug models from a Scope window using Run, Step Forward, and Step Backward toolbar buttons.
- Multiple signals — Plot multiple signals on the same y-axis (display) using multiple input ports.
- Multiple y-axes (displays) — Display multiple y-axes. All the y-axes have a common time range on the x-axis.
- Modify parameters — Modify scope parameter values before and during a simulation.
- Axis autoscaling — Autoscale axes during or at the end of a simulation. Margins are drawn at the top and bottom of the axes.
- Display data after simulation — Scope data is saved during a simulation. If a scope is closed at the start of a simulation, when you open the scope after a simulation, the scope displays simulation results for attached input signals.

**Note** If you have a high sample rate or long simulation time, you may run into issues with memory or system performance because the scope saves data internally. To limit the amount of data saved for scope visualization, use the Limit data points to last property.
For information on controlling a scope programmatically, see “Control Scope Blocks Programmatically”.

Limitations

• Do not use scope blocks in a Library. If you place a scope block inside a library block with a locked link or in a locked library, Simulink displays an error when trying to open the scope window. To display internal data from a library block, add an output port to the library block, and then connect the port to a Scope block in your model.
• If you step through a model, the scope only updates when the scope block runs. This means that the time shown in the status bar may not match the model time.
• When connected to a constant signal, a scope block may plot a single point.
• The scope shows gaps in the display when the signal value is NaN.
• When you visualize multiple frame-based signals in the scope, some samples of signals with a frame size of 1 might not be displayed. To visualize these signals, move the signals with frame size of 1 to a separate scope.

Ports

Input

Port_1 — Signal or signals to visualize
scalar | vector | matrix | array | bus | nonvirtual bus

Connect the signals you want to visualize. You can have up to 96 input ports. Input signals can have these characteristics:

• **Type** — Continuous (sample-based) or discrete (sample-based and frame-based).
• **Data type** — Any data type that Simulink supports. See “Data Types Supported by Simulink”.
• **Dimension** — Scalar, one dimensional (vector), two dimensional (matrix), or multidimensional (array). Display multiple channels within one signal depending on the dimension. See “Signal Dimensions” and “Determine Output Signal Dimensions”.

1-1730
Input Limitations

- When the input is a constant signal, the scope plots a single point.
- The scope shows gaps in the display when the signal value is NaN.
- When you visualize multiple frame-based signals in the scope, some samples of signals with a frame size of 1 might not be displayed. To visualize these signals, move the signals with frame size of 1 to a separate scope.

Bus Support

You can connect nonvirtual bus and arrays of bus signals to a scope. To display the bus signals, use normal or accelerator simulation mode. The scope displays each bus element signal in the order the elements appear in the bus, from the top to the bottom. Nested bus elements are flattened.

To log nonvirtual bus signals with a scope, set the Save format parameter to Dataset. You can use any Save format to log virtual bus signals.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Properties

Configuration Properties

The Configuration Properties dialog box controls various properties about the scope displays. From the scope menu, select View > Configuration Properties.

Main

Open at simulation start — Specify when scope window opens
off (default for Scope) | on (default for Time Scope)

Select this check box to open the scope window when simulation starts.

Programmatic Use

See OpenAtSimulationStart.

Display the full path — Display block path on scope title bar
off (default) | on
Select this check box to display the block path in addition to the block name.

**Number of input ports — Number of input ports on scope block**
1 (default) | integer

Specify number of input ports on a Scope block, specified as an integer. The maximum number of input ports is 96.

**Programmatic Use**

See NumInputPorts.

**Layout — Number and arrangement of displays**
1-by-1 display (default) | an arrangement of \(m\)-by-\(n\) axes

Specify number and arrangement of displays. The maximum layout is 16 rows by 16 columns.

To expand the layout grid beyond 4 by 4, click within the dialog box and drag. Maximum of 16 rows by 16 columns.

If the number of displays is equal to the number of ports, signals from each port appear on separate displays. If the number of displays is less than the number of ports, signals from additional ports appear on the last display. For layouts with multiple columns and rows, ports are mapped down then across.
Programmatic Use

See LayoutDimensions.

**Sample time — Simulation interval between scope updates**

-1 (for inherited) (default) | positive real number

Specify the time interval between updates of the scope display. This property does not apply to floating scopes and scope viewers.

Programmatic Use

See SampleTime.

**Input processing — Channel or element signal processing**

Elements as channels (sample based) (default for Scope) | Columns as channels (frame based) (default for Time Scope)

- Elements as channels (sample based) - Process each element as a unique sample.
- Columns as channels (frame based) - Process signal values in a channel as a group of values from multiple time intervals. Frame-based processing is available only with discrete input signals.

Programmatic Use

See FrameBasedProcessing.

**Maximize axes — Maximize size of plots**

Off (default for Scope) | Auto (default for Time Scope) | On

- Auto - If “Title” on page 1-0 and “Y-label” on page 1-0 properties are not specified, maximize all plots.
- On - Maximize all plots. Values in Title and Y-label are hidden.
- Off - Do not maximize plots.

Programmatic Use

See MaximizeAxes.
**Time**

**Time span — Length of x-axis to display**

Auto (default) | User defined

- **Auto** — Difference between the simulation start and stop times.

  The block calculates the beginning and end times of the time range using the “Time display offset” on page 1-0 and “Time span” on page 1-0 properties. For example, if you set the **Time display offset** to 10 and the **Time span** to 20, the scope sets the time range from 10 to 30.

- **User defined** — Enter any value less than the total simulation time.

**Programmatic Use**

See TimeSpan.

**Time span overrun action — Display data beyond visible x-axis**

Wrap (default) | Scroll

Specify how to display data beyond the visible x-axis range.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

- **Wrap** — Draw a full screen of data from left to right, clear the screen, and then restart drawing the data from the left.

- **Scroll** — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

**Programmatic Use**

See TimeSpanOverrunAction.

**Time units — x-axis units**

None (default for Scope) | Metric (default for Time Scope) | Seconds

- **Metric** — Display time units based on the length of “Time span” on page 1-0.

- **Seconds** — Display time in seconds.

- **None** — Do not display time units.
Programmatic Use

See TimeUnits.

Time display offset — x-axis offset
0 (default) | scalar | vector

Offset the x-axis by a specified time value, specified as a real number or vector of real numbers.

For input signals with multiple channels, you can enter a scalar or vector:

• Scalar — Offset all channels of an input signal by the same time value.
• Vector — Independently offset the channels.

Programmatic Use

See TimeDisplayOffset.

Time-axis labels — Display of x-axis labels
Bottom Displays Only (default for Scope) | All (default for Time Scope) | None

Specify how x-axis (time) labels display:

• All — Display x-axis labels on all y-axes.
• None — Do not display labels. Selecting None also clears the Show time-axis label check box.
• Bottom displays only — Display x-axis label on the bottom y-axis.

Dependencies

To enable this property, set:

• “Show time-axis label” on page 1-0 to on.
• “Maximize axes” on page 1-0 to off.

The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use

See TimeAxisLabels.
**Show time-axis label — Display or hide x-axis labels**

off (default for Scope) | on (default for Time Scope)

Select this check box to show the x-axis label for the active display

**Dependencies**

To enable this property, set “Time-axis labels” on page 1-0 to All or Bottom Displays Only.

The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See ShowTimeAxisLabel.

**Display**

**Active display — Selected display**

1 (default) | positive integer

Selected display. Use this property to control which display is changed when changing style properties and axes-specific properties.

Specify the desired display using a positive integer that corresponds to the column-wise placement index. For layouts with multiple columns and rows, display numbers are mapped down and then across.

**Programmatic Use**

See ActiveDisplay.

**Title — Display name**

%<SignalLabel> (default) | string

Title for a display. The default value %<SignalLabel> uses the input signal name for the title.

**Dependency**

The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See Title.
Show legend — Display signal legend
off (default) | on

Toggle signal legend. The names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. Continuous signals have straight lines before their names, and discrete signals have step-shaped lines.

From the legend, you can control which signals are visible. This control is equivalent to changing the visibility in the Style properties. In the scope legend, click a signal name to hide the signal in the scope. To show the signal, click the signal name again. To show only one signal, right-click the signal name, which hides all other signals. To show all signals, press Esc.

Note The legend only shows the first 20 signals. Any additional signals cannot be controlled from the legend.

Dependency
The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use
See ShowLegend.

Show grid — Show internal grid lines
on (default) | off

Select this check box to show grid lines.

Dependency
The “Active display” on page 1-0 property determines which display is affected.

Programmatic Use
See ShowGrid.

Plot signals as magnitude and phase — Split display into magnitude and phase plots
off (default) | on
• On — Display magnitude and phase plots. If the signal is real, plots the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values. This feature is useful for complex-valued input signals. If the input is a real-valued signal, selecting this check box returns the absolute value of the signal for the magnitude.

• Off — Display signal plot. If the signal is complex, plots the real and imaginary parts on the same y-axis.

**Dependency**

The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See `PlotAsMagnitudePhase`.

**Y-limits (Minimum) — Minimum y-axis value**

-10 (default) | real scalar

Specify the minimum value of the y-axis as a real number.

**Tunable:** Yes

**Dependency**

If you select **Plot signals as magnitude and phase**, this property only applies to the magnitude plot. The y-axis limits of the phase plot are always [ -180 180 ].

The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See `YLimits`.

**Y-limits (Maximum) — Maximum y-axis value**

10 (default) | real scalar

Specify the maximum value of the y-axis as a real number.

**Tunable:** Yes

**Dependency**

If you select **Plot signals as magnitude and phase**, this property only applies to the magnitude plot. The y-axis limits of the phase plot are always [ -180 180 ].
The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See YLimits.

**Y-label — Y-axis label**

none (default for Scope) | Amplitude (default for Time Scope) | string

Specify the text to display on the y-axis. To display signal units, add (%<SignalUnits>) to the label. At the beginning of a simulation, Simulink replaces (%SignalUnits) with the units associated with the signals.

Example: For a velocity signal with units of m/s, enter Velocity (%<SignalUnits>).

**Dependency**

If you select **Plot signals as magnitude and phase**, this property does not apply. The y-axes are labeled **Magnitude** and **Phase**.

The “Active display” on page 1-0 property determines which display is affected.

**Programmatic Use**

See YLabel.

**Logging**

**Limit data points to last — Limit buffered data values**

off and 5000 (default) | on | positive integer

Limit data saved by the scope internally. By default all data points are saved so that you can view the scope visualization after the simulation finishes. For simulations with **Stop time** set to inf, consider selecting **Limit data points to last**.

**Note** If you do not select **Limit data points to last** and you have a high sample rate or long simulation time, you may run into issues with memory or system performance.

When you select this property, the scope saves the latest \( n \) data points, where \( n \) the specified number of data points.

- Off — Save and plot all data values.
• On — Save specified number of data values for each signal. If the signal is frame-based, the number of buffered data values is the specified number of data values multiplied by the frame size.

In some cases, selecting this parameter can have the effect of plotting signals for less than the entire time range of a simulation (for example if your sample time is small). If the scope plots a portion of your signals, consider increasing the number of data points to save.

This property limits the data values plotted in the scope and the data values saved to a MATLAB variable specified in “Variable name” on page 1-0.

**Programmatic Use**

See `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints`.

**Decimation — Reduce amount of scope data to display and save**

off, 2 (default) | on | positive integer

• On — Plot and log (save) scope data every Nth data point, where N is the decimation factor entered in the text box. A value of 1 buffers all data values.

• Off — Save all scope data values.

**Dependency**

To enable this property, select “Log data to workspace” on page 1-0.

This property limits the data values plotted in the scope and the data values saved to a MATLAB variable specified in “Variable name” on page 1-0.

**Programmatic Use**

See `DataLoggingDecimateData` and `DataLoggingDecimation`.

**Log data to workspace — Save data to MATLAB workspace**

off (default) | on

Select this check box to enable logging and enable the **Variable name**, **Save format**, and **Decimation** properties. This property does not apply to floating scopes and scope viewers.

For an example of saving signals to the MATLAB Workspace using a Scope block, see “Save Simulation Data from Floating Scope”.
**Programmatic Use**

See DataLogging.

**Variable name — Name of saved data variable**

*ScopeData (default) | string*

Specify a variable name for saving scope data in the MATLAB workspace. This property does not apply to floating scopes and scope viewers.

**Dependency**

To enable this property, select “Log data to workspace” on page 1-0.

**Programmatic Use**

See DataLoggingVariableName.

**Save format — MATLAB variable format**

*Dataset (default) | Structure With Time | Structure | Array*

Select variable format for saving data to the MATLAB workspace. This property does not apply to floating scopes and scope viewers.

- **Dataset** — Save data as a dataset object. Use the **Dataset signal format** configuration parameter to select the dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- **Structure With Time** — Save data as a structure with associated time information.
- **Structure** — Save data as a structure.
- **Array** — Save data as an array with associated time information. This format does not support variable-size data.

**Dependency**

To enable this property, select “Log data to workspace” on page 1-0.

**Programmatic Use**

See DataLoggingSaveFormat.
Axes Scaling Properties

The Axes Scaling dialog controls the axes limits of the scope. To open the Axes Scaling properties, in the scope menu, select Tools > Axes Scaling > Axes Scaling Properties.

Axes scaling — Y-axis scaling mode
Manual (default) | Auto | After N Updates

- **Manual** — Manually scale the y-axis range with the Scale Y-axis Limits toolbar button.
- **Auto** — Scale the y-axis range during and after simulation. Selecting this option displays the “Do not allow Y-axis limits to shrink” check box. If you want the y-axis range to increase and decrease with the maximum value of a signal, set Axes scaling to Auto and clear the Do not allow Y-axis limits to shrink check box.
- **After N Updates** — Scale y-axis after the number of time steps specified in the “Number of updates” text box (10 by default). Scaling occurs only once during each run.

Programmatic Use

See AxesScaling.

Do not allow Y-axis limits to shrink — When y-axis limits can change
on (default) | off

Allow y-axis range limits to increase but not decrease during a simulation.

Dependency

To use this property, set “Axes scaling” to Auto.

Number of updates — Number of updates before scaling
10 (default) | integer

Set this property to delay auto scaling the y-axis.

Dependency

To use this property, set “Axes scaling” to After N Updates.
Programmatic Use

See AxesScalingNumUpdates.

**Scale axes limits at stop — When y-axis limits can change**

on (default) | off

- On — Scale axes when simulation stops.
- Off — Scale axes continually.

**Dependency**

To use this property, set “Axes scaling Axes scaling” on page 1-0 to Auto.

**Y-axis Data range (%) — Percent of y-axis to use for plotting**

80 (default) | integer between [1, 100]

Specify the percentage of the y-axis range used for plotting data. If you set this property to 100, the plotted data uses the entire y-axis range.

**Y-axis Align — Alignment along y-axis**

Center (default) | Top | Bottom

Specify where to align plotted data along the y-axis data range when Y-axis Data range is set to less than 100 percent.

- Top — Align signals with the maximum values of the y-axis range.
- Center — Center signals between the minimum and maximum values.
- Bottom — Align signals with the minimum values of the y-axis range.

**Autoscale X-axis limits — Scale x-axis range limits**

off (default) | on

Scale x-axis range to fit all signal values. If Axes scaling is set to Auto, the data currently within the axes is scaled, not the entire signal in the data buffer.

**X-axis Data range (%) — Percent of x-axis to use for plotting**

100 (default) | integer in the range [1, 100]

Specify the percentage of the x-axis range to plot data on. For example, if you set this property to 100, plotted data uses the entire x-axis range.
**X-axis Align — Alignment along x-axis**
Center (default) | Top | Bottom

Specify where to align plotted data along the x-axis data range when **X-axis Data range** is set to less than 100 percent.

- **Top** — Align signals with the maximum values of the x-axis range.
- **Center** — Center signals between the minimum and maximum values.
- **Bottom** — Align signals with the minimum values of the x-axis range.

**Style Properties**

To open the Style dialog box, from the scope menu, select **View > Style**.

**Figure color — Background color for window**
black (default) | color

Background color for the scope.

**Plot type — How to plot signal**
Auto (default for Scope) | Line (default for Time Scope) | Stairs | Stem

When you select **Auto**, the plot type is a line graph for continuous signals, a stair-step graph for discrete signals, and a stem graph for Simulink message signals.

**Axes colors — Background and axes color for individual displays**
black (default) | color

Select the background color for axes (displays) with the first color palette. Select the grid and label color with the second color palette.

**Preserve colors for copy to clipboard — Copy scope without changing colors**
off (default) | on

Specify whether to use the displayed color of the scope when copying.

When you select **File > Copy to Clipboard**, the software changes the color of the scope to be printer friendly (white background, visible lines). If you want to copy and paste the scope with the colors displayed, select this check box.
Properties for line — Line to change
Channel 1 (default)

Select active line for setting line style properties.

Visible — Line visibility
on (default) | off

Show or hide a signal on the plot.

Dependency
The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Line — Line style
solid line (default style) | 0.75 (default width) | yellow (default color)

Select line style, width, and color.

Dependency
The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Marker — Data point marker style
None (default) | marker shape

Select marker shape.

Dependency
The values of “Active display” on page 1-0 and “Properties for line” on page 1-0 determine which line is affected.

Extended Capabilities

**C/C++ Code Generation**
Generate C and C++ code using Simulink® Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.

**HDL Code Generation**
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

**PLC Code Generation**
Generate Structured Text code using Simulink® PLC Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.
Fixed-Point Conversion
Design and simulate fixed-point systems using Fixed-Point Designer™.

This block accepts fixed-point input, but converts it to double for display.

Introduced in R2015b
Second-Order Integrator

Integrate input signal twice

**Library:** Simulink / Continuous

---

**Description**

The Second-Order Integrator block and the Second-Order Integrator Limited block solve the second-order initial value problem:

\[
\frac{d^2x}{dt^2} = u,
\]

\[
\frac{dx}{dt}\bigg|_{t=0} = dx_0,
\]

\[
x|_{t=0} = x_0,
\]

where \( u \) is the input to the system. The block is therefore a dynamic system with two continuous states: \( x \) and \( dx/dt \).

**Note** These two states have a mathematical relationship, namely, that \( dx/dt \) is the derivative of \( x \). To satisfy this relationship throughout the simulation, Simulink places various constraints on the block parameters and behavior.

The Second-Order Integrator Limited block is identical to the Second-Order Integrator block with the exception that it defaults to limiting the states based on the specified upper and lower limits. For more information, see “Limiting the States” on page 1-1750.

Simulink software can use several different numerical integration methods to compute the outputs of the block. Each has advantages for specific applications. Use the **Solver** pane of the Configuration Parameters dialog box to select the technique best suited to your application. (For more information, see “Solver Selection Criteria”.) The selected
solver computes the states of the Second-Order Integrator block at the current time step using the current input value.

Use the block parameter dialog box to:

- Specify whether the source of each state initial condition is internal or external
- Specify a value for the state initial conditions
- Define upper and lower limits on either or both states
- Specify absolute tolerances for each state
- Specify names for both states
- Choose an external reset condition
- Enable zero-crossing detection
- Reinitialize dx/dt when x reaches saturation
- Specify that Simulink disregard the state limits and external reset for linearization operations

**Defining Initial Conditions**

You can define the initial conditions of each state individually as a parameter on the block dialog box or input one or both of them from an external signal.

- To define the initial conditions of state \( x \) as a block parameter, use the **Initial condition source** \( x \) drop-down menu to select **internal** and enter the value in the **Initial condition** \( x \) field.
- To provide the initial conditions from an external source for state \( x \), specify the **Initial condition source** \( x \) parameter as **external**. An additional input port appears on the block.
- To define the initial conditions of state \( dx/dt \) as a block parameter, use the **Initial condition source** \( dx/dt \) drop-down menu to select **internal** and enter the value in the **Initial condition** \( dx/dt \) field.
- To provide the initial conditions from an external source for state \( dx/dt \), specify **Initial condition source** \( dx/dt \) as **external**. An additional input port appears on the block.

If you choose to use an external source for both state initial conditions, your block appears as follows.
Note

- Simulink does not allow initial condition values of `inf` or `NaN`.
- If you limit state \( x \) or state \( dx/dt \) by specifying saturation limits (see “Limiting the States” on page 1-1750) and one or more initial conditions are outside the corresponding limits, then the respective states are initialized to the closest valid value and a set of consistent initial conditions is calculated.

Limiting the States

When modeling a second-order system, you may need to limit the block states. For example, the motion of a piston within a cylinder is governed by Newton's Second Law and has constraints on the piston position \( (x) \). With the Second-Order Integrator block, you can limit the states \( x \) and \( dx/dt \) independent of each other. You can even change the limits during simulation; however, you cannot change whether or not the states are limited. An important rule to follow is that an upper limit must be strictly greater than its corresponding lower limit.

The block appearance changes when you limit one or both states. With both states limited, the block appears as follows.
For each state, you can use the block parameter dialog box to set appropriate saturation limits.

**Limiting x Only**

If you use the Second-Order Integrator Limited block, both states are limited by default. But you can also manually limit state \( x \) on the Second-Order Integrator block by selecting **Limit x** and entering the limits in the appropriate parameter fields.
The block then determines the values of the states as follows:
• When $x$ is less than or equal to its lower limit, the value of $x$ is held at its lower limit and $\frac{dx}{dt}$ is set to zero.

• When $x$ is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.

• When $x$ is greater than or equal to its upper limit, the value of $x$ is held at its upper limit and $\frac{dx}{dt}$ is set to zero.

You can choose to reinitialize $\frac{dx}{dt}$ to a new value at the time when $x$ reaches saturation. See “Reinitializing $\frac{dx}{dt}$ When $x$ Reaches Saturation” on page 1-1757.

**Limiting $\frac{dx}{dt}$ Only**

As with state $x$, state $\frac{dx}{dt}$ is set as limited by default on the $\frac{dx}{dt}$ pane of the Second-Order Integrator Limited block dialog box. You can manually set this parameter, Limit $\frac{dx}{dt}$, on the Second-Order Integrator block. In either case, you must enter the appropriate limits for $\frac{dx}{dt}$. 
If you limit only the state $dx/dt$, then the block determines the values of $dx/dt$ as follows:
• When $dx/dt$ is less than or equal to its lower limit, the value of $dx/dt$ is held at its lower limit.
• When $dx/dt$ is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.
• When $dx/dt$ is greater than or equal to its upper limit, the value of $dx/dt$ is held at its upper limit.

When state $dx/dt$ is held at it upper or lower limit, the value of $x$ is governed by the first-order initial value problem:

$$\frac{dx}{dt} = L,$$
$$x(t_L) = x_L,$$

where $L$ is the $dx/dt$ limit (upper or lower), $t_L$ is the time when $dx/dt$ reaches this limit, and $x_L$ is the value of state $x$ at that time.

**Limiting Both States**

When you limit both states, Simulink maintains mathematical consistency of the states by limiting the allowable values of the upper and lower limits for $dx/dt$. Such limitations are necessary to satisfy the following constraints:

• When $x$ is at its saturation limits, the value of $dx/dt$ must be zero.
• In order for $x$ to leave the upper limit, the value of $dx/dt$ must be strictly negative.
• In order for $x$ to leave its lower limit, the value of $dx/dt$ must be strictly positive.

For such cases, the upper limit of $dx/dt$ must be strictly positive and the lower limit of $dx/dt$ must be strictly negative.

When both states are limited, the block determines the states as follows:

• Whenever $x$ reaches its limits, the resulting behavior is the same as that described in “Limiting $x$ only”.
• Whenever $dx/dt$ reaches one of its limits, the resulting behavior is the same as that described in “Limiting $dx/dt$ only” — including the computation of $x$ using a first-order ODE when $dx/dt$ is held at one of its limits. In such cases, when $x$ reaches one of its limits, it is held at that limit and $dx/dt$ is set to zero.
Whenever both reach their respective limits simultaneously, the state $x$ behavior overrides $dx/dt$ behavior to maintain consistency of the states.

When you limit both states, you can choose to reinitialize $dx/dt$ at the time when state $x$ reaches saturation. If the reinitialized value is outside specified limits on $dx/dt$, then $dx/dt$ is reinitialized to the closest valid value and a consistent set of initial conditions is calculated. See “Reinitializing dx/dt When x Reaches Saturation” on page 1-1757

**Resetting the State**

The block can reset its states to the specified initial conditions based on an external signal. To cause the block to reset its states, select one of the **External reset** choices on the Attributes pane. A trigger port appears on the block below its input port and indicates the trigger type.

- Select **rising** to reset the states when the reset signal rises from zero to a positive value, from a negative to a positive value, or a negative value to zero.
- Select **falling** to reset the states when the reset signal falls from a positive value to zero, from a positive to a negative value, or from zero to negative.
- Select **either** to reset the states when the reset signal changes from zero to a nonzero value or changes sign.

The reset port has direct feedthrough. If the block output feeds back into this port, either directly or through a series of blocks with direct feedthrough, an algebraic loop results (see “Algebraic Loop Concepts”).
Enabling Zero-Crossing Detection

This parameter controls whether zero-crossing detection is enabled for this block. By default, the Enable zero-crossing detection parameter is selected on the Attributes pane. However, this parameter is only in affect if the Zero-crossing control, on the Solver pane of the Configuration Parameters dialog box, is set to Use local settings. For more information, see “Zero-Crossing Detection”.

Reinitializing $dx/dt$ When $x$ Reaches Saturation

For certain modeling applications, $dx/dt$ must be reinitialized when state $x$ reaches its limits in order to pull $x$ out of saturation immediately. You can achieve this by selecting Reinitialize $dx/dt$ when $x$ reaches saturation on the Attributes pane.

If this option is on, then at the instant when $x$ reaches saturation, Simulink checks whether the current value of the $dx/dt$ initial condition (parameter or signal) allows the state $x$ to leave saturation immediately. If so, Simulink reinitializes state $dx/dt$ with the value of the initial condition (parameter or signal) at that instant. If not, Simulink ignores this parameter at the current instant and sets $dx/dt$ to zero to make the block states consistent.

This parameter only applies at the time when $x$ actually reaches saturation limit. It does not apply at any future time when $x$ is being held at saturation.

Refer to the sections on limiting the states for more information. For an example, see “Simulation of a Bouncing Ball” on page 15-7.

Disregarding State Limits and External Reset for Linearization

For cases where you simplify your model by linearizing it, you can have Simulink disregard the limits of the states and the external reset by selecting Ignore state limits and the reset for linearization.

Specifying the Absolute Tolerance for the Block Outputs

By default Simulink software uses the absolute tolerance value specified in the Configuration Parameters dialog box (see “Error Tolerances for Variable-Step Solvers”) to compute the output of the integrator blocks. If this value does not provide sufficient error control, specify a more appropriate value for state $x$ in the Absolute tolerance $x$ field.
and for state $dx/dt$ in the **Absolute tolerance** $dx/dt$ field of the parameter dialog box. Simulink uses the values that you specify to compute the state values of the block.

### Specifying the Display of the Output Ports

You can control whether to display the $x$ or the $dx/dt$ output port using the **ShowOutput** parameter. You can display one output port or both; however, you must select at least one.

### Specifying the State Names

You can specify the name of $x$ states and $dx/dt$ states using the **StateNameX** and **StateNameDXDT** parameters. However, you must specify names for both or neither; you cannot specify names for just $x$ or just $dx/dt$. Both state names must have identical type and length. Furthermore, the number of names must evenly divide the number of states.

### Selecting All Options

When you select all options, the block icon looks like this.

![Integrator, Second-Order Block Icon](image)

### Ports

#### Input

 greentext

$u$ — Input signal $u$

- scalar
- vector
- matrix
Input signal \( u \) to the integrator system, specified as a scalar, vector, or matrix.

Data Types: double

\( x_0 \) — Initial condition \( x_0 \)

scalar | vector | matrix

External signal specifying the initial condition \( x_0 \) to the integrator system. You can specify the initial condition as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the Initial condition source \( x \) parameter to external.

Data Types: double

\( dx_0 \) — Initial condition \( dx_0 \)

scalar | vector | matrix

External signal specifying the initial condition \( dx_0 \) to the integrator system. You can specify the initial condition \( dx_0 \) as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the Initial condition source \( dx/dt \) parameter to external.

Data Types: double

Output

\( x \) — Output signal \( x \)

scalar | vector | matrix

\( x \) state output signal, provided as a scalar, vector, or matrix.

Data Types: double

\( dx \) — Output signal \( dx \)

scalar | vector | matrix

\( dx \) state output signal, specified as a scalar, vector, or matrix.

Data Types: double
**Parameters**

**x**

*Initial condition source x — Source of initial condition for state x*

- **internal** (default) | **external**

 Specify the source of the initial conditions for state x.

- **internal** — Get the initial conditions of state x from the **Initial condition x** parameter.
- **external** — Get the initial conditions of state x from an external block connected to the **X0** input port.

**Limitations**

Simulink software does not allow the initial condition of this block to be inf or NaN.

**Dependencies**

Selecting **internal** enables the **Initial condition x** parameter and removes the **X0** input port.

Selecting **external** disables the **Initial condition x** parameter and enables the **X0** input port.

**Programmatic Use**

**Block Parameter:** **ICSourceX**

- **Type:** character vector, string
- **Values:** 'internal' | 'external'
- **Default:** 'internal'

*Initial condition x — Initial condition of state x*

- **0.0** (default) | **scalar** | **vector** | **matrix**

Specify the initial condition of state x.

**Limitations**

Simulink software does not allow the initial condition of this block to be inf or NaN.
Dependencies

To enable this parameter, set Initial condition source \( x \) to internal.

Setting Initial condition source \( x \) to external disables this parameter and enables the \( X_0 \) input port.

Programmatic Use
Block Parameter: ICX
Type: character vector, string
Values: scalar | vector | matrix
Default: '0.0'

Limit \( x \) — Limit values of state \( x \)
off | on

Limit state \( x \) of the block to a value between the Lower limit \( x \) and Upper limit \( x \) parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

- To limit state \( x \) to a value between the Lower limit \( x \) and Upper limit \( x \) parameters, select this check box.
- To remove range limitations on state \( x \), clear this check box.

Dependencies

Selecting this check box enables the Upper limit \( x \) and Lower limit \( x \) parameters.

Programmatic Use
Block Parameter: LimitX
Type: character vector, string
Values: 'off' | 'on'
Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit \( x \) — Upper limit of state \( x \)
1 | inf | scalar | vector | matrix

Specify the upper limit of state \( x \). The default value for the Second-Order Integrator block is inf. The default value for the Second-Order Integrator Limited block is 1.

Tips

The upper saturation limit for state \( x \) must be strictly greater than the lower saturation limit.
Dependencies

To enable this parameter, select the Limit x check box.

Programmatic Use
Block Parameter: UpperLimitX
Type: character vector, string
Values: '1' | 'inf' | scalar | vector | matrix
Default: '1' (Second-Order Integrator Limited) | 'inf' (Second-Order Integrator)

Lower limit x — Lower limit of state x
θ (default) | -inf | scalar | vector | matrix

Specify the lower limit of state x. The default value for the Second-Order Integrator block is -inf. The default value for the Second-Order Integrator Limited block is θ.

Tip
The lower saturation limit for state x must be strictly less than the upper saturation limit.

Dependencies
To enable this parameter, select the Limit x check box.

Programmatic Use
Block Parameter: LowerLimitX
Type: character vector, string
Values: 'θ' | '-inf' | scalar | vector | matrix
Default: 'θ' (Second-Order Integrator Limited) | '-inf' (Second-Order Integrator)

Wrap x — Enable wrapping of x
off (default) | on

Enable wrapping of x between the Wrapped upper value x and Wrapped lower value x parameters. Enabling wrapping of x eliminates the need for zero-crossing detection, reduces solver resets, improves solver performance and accuracy, and increases simulation time span when modeling rotary and cyclic state trajectories.

If you specify Wrapped upper value x as inf and Wrapped lower value x as -inf, wrapping will never occur.

Dependencies
Selecting this check box enables Wrapped upper value x and Wrapped lower value x.
Programmatic Use
Block Parameter: WrapX
Type: character vector, string
Values: 'off' | 'on'
Default: 'off'

Wrapped upper value x — Upper value for wrapping x
	pi (default) | scalar | vector | matrix

Specify the upper value for wrapping x.

Dependencies
To enable this parameter, select the Wrap x check box.

Programmatic Use
Block Parameter: WrappedUpperValueX
Type: character vector, string
Values: scalar | vector | matrix
Default: 'pi'

Wrapped lower value x — Lower value for wrapping x

-pi (default) | scalar | vector | matrix

Specify the lower value for wrapping x.

Dependencies
To enable this parameter, select the Wrap x check box.

Programmatic Use
Block Parameter: WrappedLowerValueX
Type: character vector, string
Values: scalar | vector | matrix
Default: '-pi'

Absolute tolerance x — Absolute tolerance for computing state x
auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state x.

- You can enter auto, -1, a positive real scalar or vector.
- If you enter auto or -1, Simulink uses the absolute tolerance value in the
  Configuration Parameters dialog box (see “Solver Pane”) to compute state x.
• If you enter a real scalar value, that value overrides the absolute tolerance in the Configuration Parameters dialog box and is used for computing all x states.

• If you enter a real vector, the dimension of that vector must match the dimension of state x. These values override the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use

Block Parameter: AbsoluteToleranceX
Type: character vector; string
Values: 'auto' | '-' | any positive real scalar or vector
Default: 'auto'

State name x — Name for state x
' ' (default) | character vector | string

Assign a unique name to state x.

Tips

• To assign a name to a single state, enter the name between quotes, for example, position'.

• To assign names to multiple x states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.

• The state names apply only to the selected block.

• If you specify a state name for x, you must also specify a state name for dx/dt.

• State names for x and dx/dt must have identical types and lengths.

• The number of states must be evenly divided by the number of state names. You can specify fewer names than x states, but you cannot specify more names than x states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for dx/dt.

• To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string or a cell array.

Programmatic Use

Block Parameter: StateNameX
Type: character vector; string
Values: ' ' | user-defined
Default: ''
**dx/dt**

**Initial condition source dx/dt — Source of initial condition for state dx/dt**
*internal* (default) | *external*

Specify the source of initial conditions for state \( dx/dt \) as *internal* or *external*.

**Limitations**

Simulink software does not allow the initial condition of this block to be *inf* or *NaN*.

**Dependencies**

- Selecting *internal* enables the **Initial condition dx/dt** parameter and removes the \( dx_0 \) input port.
- Selecting *external* disables the **Initial condition dx/dt** parameter and enables the \( dx_0 \) input port.

**Programmatic Use**

*Block Parameter: ICSourceDXDT*
*Type: character vector*
*Values: 'internal' | 'external'*
*Default: 'internal'*

**Initial condition dx/dt — Initial condition of state dx/dt**
*0.0 (default) | scalar | vector | matrix*

Specify the initial condition of state \( dx/dt \).

**Limitations**

Simulink software does not allow the initial condition of this block to be *inf* or *NaN*.

**Dependencies**

- Setting **Initial condition source dx/dt** to *internal* enables this parameter.
- Setting **Initial condition source dx/dt** to *external* disables this parameter.

**Programmatic Use**

*Block Parameter: ICDXDT*
*Type: character vector*
*Values: scalar | vector | matrix*
*Default: '0.0'
**Limit dx/dt — Limit values of state dx/dt**

off | on

Limit the $dx/dt$ state of the block to a value between the **Lower limit dx/dt** and **Upper limit dx/dt** parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

**Tip**

If you set saturation limits for $x$, then the interval defined by the **Upper limit dx/dt** and **Lower limit dx/dt** must contain zero.

**Dependencies**

Selecting this check box enables the **Upper limit dx/dt** and **Lower limit dx/dt** parameters.

**Programmatic Use**

**Parameter:** LimitDXDT  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

**Upper limit dx/dt — Upper limit of state dx/dt**

$\infty$ (default) | scalar | vector | matrix

Specify the upper limit for state $dx/dt$.

**Dependencies**

If you limit $x$, then this parameter must have a strictly positive value.

To enable this parameter, select the **Limit dx/dt** check box.

**Programmatic Use**

**Block Parameter:** UpperLimitDXDT  
**Type:** character vector  
**Values:** scalar | vector | matrix  
**Default:** '$\infty$'

**Lower limit dx/dt — Lower limit of state dx/dt**

$-\infty$ (default) | scalar | vector | matrix

Specify the lower limit for state $dx/dt$. 
Dependencies

If you limit x, then this parameter must have a strictly negative value.

To enable this parameter, select the Limit dx/dt check box.

Programmatic Use

Block Parameter: LowerLimitDXDT
Type: character vector
Values: scalar | vector | matrix
Default: '-inf'

Absolute tolerance dx/dt — Absolute tolerance for computing state dx/dt
auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state dx/dt.

- You can enter auto, –1, a positive real scalar or vector.
- If you enter auto or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute the dx/dt output of the block.
- If you enter a numeric value, that value overrides the absolute tolerance in the Configuration Parameters dialog box.

Programmatic Use

Block Parameter: AbsoluteToleranceDXDT
Type: character vector, string, scalar, or vector
Values: 'auto' | '-1' | any positive real scalar or vector
Default: 'auto'

State name dx/dt — Name for state dx/dt
' ' (default) | character vector | string

Assign a unique name to state dx/dt.

Tips

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple dx/dt states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
• The state names apply only to the selected block.
• If you specify a state name for \( dx/dt \), you must also specify a state name for \( x \).
• State names for \( x \) and \( dx/dt \) must have identical types and lengths.
• The number of states must be evenly divided by the number of state names. You can specify fewer names than \( dx/dt \) states, but you cannot specify more names than \( dx/dt \) states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for \( x \).
• To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, or a cell array.

**Programmatic Use**

**Block Parameter:** StateNameDXDT  
**Type:** character vector, string  
**Values:** ' ' | user-defined  
**Default:** ' '

**Attributes**

**External reset — Reset states to their initial conditions**  
none (default) | rising | falling | either

Reset the states to their initial conditions when a trigger event occurs in the reset signal.

- none — Do not reset the state to initial conditions.
- rising — Reset the state when the reset signal rises from a zero to a positive value or from a negative to a positive value.
- falling — Reset the state when the reset signal falls from a positive value to zero or from a positive to a negative value.
- either — Reset the state when the reset signal changes from zero to a nonzero value or changes sign.

**Programmatic Use**

**Block Parameter:** ExternalReset  
**Type:** character vector, string  
**Values:** 'none' | 'rising' | 'falling' | 'either'  
**Default:** 'none'
Enable zero-crossing detection — Enable zero-crossing detection
on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

**Programmatic Use**
**Parameter:** ZeroCross  
**Type:** character vector, string  
**Values:** 'on' | 'off'  
**Default:** 'on'

Reinitialize dx/dt when x reaches saturation — Reset dx/dt when x reaches saturation
off (default) | on

At the instant when state x reaches saturation, reset dx/dt to its current initial conditions.

**Tip**

The dx/dt initial condition must have a value that enables x to leave saturation immediately. Otherwise, Simulink ignores the initial conditions for dx/dt to preserve mathematical consistency of block states.

**Programmatic Use**
**Block Parameter:** ReinitDXDTwhenXreachesSaturation  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

Ignore state limits and the reset for linearization — Ignore state limits and external reset for linearization
off (default) | on

For linearization purposes, have Simulink ignore the specified state limits and the external reset.

**Programmatic Use**
**Block Parameter:** IgnoreStateLimitsAndResetForLinearization  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'
Show output — Output ports to display
both (default) | x | dx/dt

Specify the output ports on the block.

- both — Show both x and dx/dt output ports.
- x — Show only the x output port.
- dx/dt — Show only the dx/dt output port.

Programmatic Use
Block Parameter: ShowOutput
Type: character vector, string
Values: 'both' | 'x' | 'dxdt'
Default: 'both'

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain
dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

**Introduced in R2010a**
Second-Order Integrator Limited

Integrate input signal twice
Library: Simulink / Continuous

Description

The Second-Order Integrator block and the Second-Order Integrator Limited block solve the second-order initial value problem:

\[ \frac{d^2x}{dt^2} = u, \]
\[ \left. \frac{dx}{dt} \right|_{t=0} = d\xi, \]
\[ x|_{t=0} = x_0, \]

where \( u \) is the input to the system. The block is therefore a dynamic system with two continuous states: \( x \) and \( dx/dt \).

Note These two states have a mathematical relationship, namely, that \( dx/dt \) is the derivative of \( x \). To satisfy this relationship throughout the simulation, Simulink places various constraints on the block parameters and behavior.

The Second-Order Integrator Limited block is identical to the Second-Order Integrator block with the exception that it defaults to limiting the states based on the specified upper and lower limits. For more information, see “Limiting the States” on page 1-1774.

Simulink software can use several different numerical integration methods to compute the outputs of the block. Each has advantages for specific applications. Use the Solver pane of the Configuration Parameters dialog box to select the technique best suited to your application. (For more information, see “Solver Selection Criteria”.) The selected
solver computes the states of the Second-Order Integrator block at the current time step using the current input value.

Use the block parameter dialog box to:

- Specify whether the source of each state initial condition is internal or external
- Specify a value for the state initial conditions
- Define upper and lower limits on either or both states
- Specify absolute tolerances for each state
- Specify names for both states
- Choose an external reset condition
- Enable zero-crossing detection
- Reinitialize dx/dt when x reaches saturation
- Specify that Simulink disregard the state limits and external reset for linearization operations

**Defining Initial Conditions**

You can define the initial conditions of each state individually as a parameter on the block dialog box or input one or both of them from an external signal.

- To define the initial conditions of state x as a block parameter, use the **Initial condition source x** drop-down menu to select **internal** and enter the value in the **Initial condition x** field.
- To provide the initial conditions from an external source for state x, specify the **Initial condition source x** parameter as **external**. An additional input port appears on the block.
- To define the initial conditions of state dx/dt as a block parameter, use the **Initial condition source dx/dt** drop-down menu to select **internal** and enter the value in the **Initial condition dx/dt** field.
- To provide the initial conditions from an external source for state dx/dt, specify **Initial condition source dx/dt** as **external**. An additional input port appears on the block.

If you choose to use an external source for both state initial conditions, your block appears as follows.
Note

- Simulink does not allow initial condition values of \( \text{inf} \) or \( \text{NaN} \).
- If you limit state \( x \) or state \( dx/dt \) by specifying saturation limits (see “Limiting the States” on page 1-1774) and one or more initial conditions are outside the corresponding limits, then the respective states are initialized to the closest valid value and a set of consistent initial conditions is calculated.

Limiting the States

When modeling a second-order system, you may need to limit the block states. For example, the motion of a piston within a cylinder is governed by Newton's Second Law and has constraints on the piston position \( (x) \). With the Second-Order Integrator block, you can limit the states \( x \) and \( dx/dt \) independent of each other. You can even change the limits during simulation; however, you cannot change whether or not the states are limited. An important rule to follow is that an upper limit must be strictly greater than its corresponding lower limit.

The block appearance changes when you limit one or both states. With both states limited, the block appears as follows.
For each state, you can use the block parameter dialog box to set appropriate saturation limits.

**Limiting x Only**

If you use the Second-Order Integrator Limited block, both states are limited by default. But you can also manually limit state $x$ on the Second-Order Integrator block by selecting **Limit x** and entering the limits in the appropriate parameter fields.
The block then determines the values of the states as follows:
• When \( x \) is less than or equal to its lower limit, the value of \( x \) is held at its lower limit and \( dx/dt \) is set to zero.

• When \( x \) is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.

• When \( x \) is greater than or equal to its upper limit, the value of \( x \) is held at its upper limit and \( dx/dt \) is set to zero.

You can choose to reinitialize \( dx/dt \) to a new value at the time when \( x \) reaches saturation. See “Reinitializing \( dx/dt \) When \( x \) Reaches Saturation” on page 1-1781.

**Limiting \( dx/dt \) Only**

As with state \( x \), state \( dx/dt \) is set as limited by default on the \( dx/dt \) pane of the Second-Order Integrator Limited block dialog box. You can manually set this parameter, **Limit \( dx/dt \)**, on the Second-Order Integrator block. In either case, you must enter the appropriate limits for \( dx/dt \).
If you limit only the state $dx/dt$, then the block determines the values of $dx/dt$ as follows:
When \( \frac{dx}{dt} \) is less than or equal to its lower limit, the value of \( \frac{dx}{dt} \) is held at its lower limit.

When \( \frac{dx}{dt} \) is in between its lower and upper limits, both states follow the trajectory given by the second-order ODE.

When \( \frac{dx}{dt} \) is greater than or equal to its upper limit, the value of \( \frac{dx}{dt} \) is held at its upper limit.

When state \( \frac{dx}{dt} \) is held at its upper or lower limit, the value of \( x \) is governed by the first-order initial value problem:

\[
\frac{dx}{dt} = L, \\
x(t_L) = x_L,
\]

where \( L \) is the \( \frac{dx}{dt} \) limit (upper or lower), \( t_L \) is the time when \( \frac{dx}{dt} \) reaches this limit, and \( x_L \) is the value of state \( x \) at that time.

### Limiting Both States

When you limit both states, Simulink maintains mathematical consistency of the states by limiting the allowable values of the upper and lower limits for \( \frac{dx}{dt} \). Such limitations are necessary to satisfy the following constraints:

- When \( x \) is at its saturation limits, the value of \( \frac{dx}{dt} \) must be zero.
- In order for \( x \) to leave the upper limit, the value of \( \frac{dx}{dt} \) must be strictly negative.
- In order for \( x \) to leave its lower limit, the value of \( \frac{dx}{dt} \) must be strictly positive.

For such cases, the upper limit of \( \frac{dx}{dt} \) must be strictly positive and the lower limit of \( \frac{dx}{dt} \) must be strictly negative.

When both states are limited, the block determines the states as follows:

- Whenever \( x \) reaches its limits, the resulting behavior is the same as that described in “Limiting \( x \) only”.
- Whenever \( \frac{dx}{dt} \) reaches one of its limits, the resulting behavior is the same as that described in “Limiting \( \frac{dx}{dt} \) only” — including the computation of \( x \) using a first-order ODE when \( \frac{dx}{dt} \) is held at one of its limits. In such cases, when \( x \) reaches one of its limits, it is held at that limit and \( \frac{dx}{dt} \) is set to zero.
Whenever both reach their respective limits simultaneously, the state $x$ behavior overrides $dx/dt$ behavior to maintain consistency of the states.

When you limit both states, you can choose to reinitialize $dx/dt$ at the time when state $x$ reaches saturation. If the reinitialized value is outside specified limits on $dx/dt$, then $dx/dt$ is reinitialized to the closest valid value and a consistent set of initial conditions is calculated. See “Reinitializing $dx/dt$ When $x$ Reaches Saturation” on page 1-1781.

**Resetting the State**

The block can reset its states to the specified initial conditions based on an external signal. To cause the block to reset its states, select one of the **External reset** choices on the Attributes pane. A trigger port appears on the block below its input port and indicates the trigger type.

- Select **rising** to reset the states when the reset signal rises from zero to a positive value, from a negative to a positive value, or a negative value to zero.
- Select **falling** to reset the states when the reset signal falls from a positive value to zero, from a positive to a negative value, or from zero to negative.
- Select **either** to reset the states when the reset signal changes from zero to a nonzero value or changes sign.

The reset port has direct feedthrough. If the block output feeds back into this port, either directly or through a series of blocks with direct feedthrough, an algebraic loop results (see “Algebraic Loop Concepts”).
Enabling Zero-Crossing Detection

This parameter controls whether zero-crossing detection is enabled for this block. By default, the Enable zero-crossing detection parameter is selected on the Attributes pane. However, this parameter is only in affect if the Zero-crossing control, on the Solver pane of the Configuration Parameters dialog box, is set to Use local settings. For more information, see “Zero-Crossing Detection”.

Reinitializing $dx/dt$ When $x$ Reaches Saturation

For certain modeling applications, $dx/dt$ must be reinitialized when state $x$ reaches its limits in order to pull $x$ out of saturation immediately. You can achieve this by selecting Reinitialize dx/dt when x reaches saturation on the Attributes pane.

If this option is on, then at the instant when $x$ reaches saturation, Simulink checks whether the current value of the $dx/dt$ initial condition (parameter or signal) allows the state $x$ to leave saturation immediately. If so, Simulink reinitializes state $dx/dt$ with the value of the initial condition (parameter or signal) at that instant. If not, Simulink ignores this parameter at the current instant and sets $dx/dt$ to zero to make the block states consistent.

This parameter only applies at the time when $x$ actually reaches saturation limit. It does not apply at any future time when $x$ is being held at saturation.

Refer to the sections on limiting the states for more information. For an example, see “Simulation of a Bouncing Ball” on page 15-7.

Disregarding State Limits and External Reset for Linearization

For cases where you simplify your model by linearizing it, you can have Simulink disregard the limits of the states and the external reset by selecting Ignore state limits and the reset for linearization.

Specifying the Absolute Tolerance for the Block Outputs

By default Simulink software uses the absolute tolerance value specified in the Configuration Parameters dialog box (see “Error Tolerances for Variable-Step Solvers”) to compute the output of the integrator blocks. If this value does not provide sufficient error control, specify a more appropriate value for state $x$ in the Absolute tolerance x field.
and for state $dx/dt$ in the **Absolute tolerance dx/dt** field of the parameter dialog box. Simulink uses the values that you specify to compute the state values of the block.

### Specifying the Display of the Output Ports

You can control whether to display the $x$ or the $dx/dt$ output port using the **ShowOutput** parameter. You can display one output port or both; however, you must select at least one.

### Specifying the State Names

You can specify the name of $x$ states and $dx/dt$ states using the **StateNameX** and **StateNameDXDT** parameters. However, you must specify names for both or neither; you cannot specify names for just $x$ or just $dx/dt$. Both state names must have identical type and length. Furthermore, the number of names must evenly divide the number of states.

### Selecting All Options

When you select all options, the block icon looks like this.

![Block Icon](image)

### Ports

**Input**

- **$u$ — Input signal $u$**
  - scalar  |  vector  |  matrix
Input signal \( u \) to the integrator system, specified as a scalar, vector, or matrix.

Data Types: double

\( x_0 \) — Initial condition \( x_0 \)

scalar | vector | matrix

External signal specifying the initial condition \( x_0 \) to the integrator system. You can specify the initial condition as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the Initial condition source \( x \) parameter to external.

Data Types: double

\( dx_0 \) — Initial condition \( dx_0 \)

scalar | vector | matrix

External signal specifying the initial condition \( dx_0 \) to the integrator system. You can specify the initial condition \( dx_0 \) as a scalar, vector, or matrix.

Dependencies

To enable this input port, set the Initial condition source \( dx/dt \) parameter to external.

Data Types: double

Output

\( x \) — Output signal \( x \)

scalar | vector | matrix

\( x \) state output signal, provided as a scalar, vector, or matrix.

Data Types: double

\( dx \) — Output signal \( dx \)

scalar | vector | matrix

dx state output signal, specified as a scalar, vector, or matrix.

Data Types: double
**Parameters**

*x*

**Initial condition source x** — Source of initial condition for state x

- **internal** (default) | **external**

Specify the source of the initial conditions for state x.

- **internal** — Get the initial conditions of state x from the **Initial condition x** parameter.
- **external** — Get the initial conditions of state x from an external block connected to the X₀ input port.

**Limitations**

Simulink software does not allow the initial condition of this block to be inf or NaN.

**Dependencies**

Selecting **internal** enables the **Initial condition x** parameter and removes the X₀ input port.

Selecting **external** disables the **Initial condition x** parameter and enables the X₀ input port.

**Programmatic Use**

**Block Parameter:** ICSourceX  
**Type:** character vector, string  
**Values:** 'internal' | 'external'  
**Default:** 'internal'

**Initial condition x** — Initial condition of state x

0.0 (default) | scalar | vector | matrix

Specify the initial condition of state x.

**Limitations**

Simulink software does not allow the initial condition of this block to be inf or NaN.
Dependencies

To enable this parameter, set Initial condition source x to internal.

Setting Initial condition source x to external disables this parameter and enables the \( X_0 \) input port.

Programmatic Use

Block Parameter: ICX
Type: character vector, string
Values: scalar | vector | matrix
Default: '0.0'

Limit x — Limit values of state x

off | on

Limit state \( x \) of the block to a value between the Lower limit \( x \) and Upper limit \( x \) parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

- To limit state \( x \) to a value between the Lower limit \( x \) and Upper limit \( x \) parameters, select this check box.
- To remove range limitations on state \( x \), clear this check box.

Dependencies

Selecting this check box enables the Upper limit \( x \) and Lower limit \( x \) parameters.

Programmatic Use

Block Parameter: LimitX
Type: character vector, string
Values: 'off' | 'on'
Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit \( x \) — Upper limit of state \( x \)

1 | inf | scalar | vector | matrix

Specify the upper limit of state \( x \). The default value for the Second-Order Integrator block is inf. The default value for the Second-Order Integrator Limited block is 1.

Tips

The upper saturation limit for state \( x \) must be strictly greater than the lower saturation limit.
Dependencies

To enable this parameter, select the Limit x check box.

Programmatic Use
Block Parameter: UpperLimitX
Type: character vector, string
Values: '1' | 'inf' | scalar | vector | matrix
Default: '1' (Second-Order Integrator Limited) | 'inf' (Second-Order Integrator)

Lower limit x — Lower limit of state x
θ (default) | -inf | scalar | vector | matrix

Specify the lower limit of state x. The default value for the Second-Order Integrator block is -inf. The default value for the Second-Order Integrator Limited block is θ.

Tip

The lower saturation limit for state x must be strictly less than the upper saturation limit.

Dependencies

To enable this parameter, select the Limit x check box.

Programmatic Use
Block Parameter: LowerLimitX
Type: character vector, string
Values: '0' | '-inf' | scalar | vector | matrix
Default: '0' (Second-Order Integrator Limited) | '-inf' (Second-Order Integrator)

Wrap x — Enable wrapping of x
off (default) | on

Enable wrapping of x between the Wrapped upper value x and Wrapped lower value x parameters. Enabling wrapping of x eliminates the need for zero-crossing detection, reduces solver resets, improves solver performance and accuracy, and increases simulation time span when modeling rotary and cyclic state trajectories.

If you specify Wrapped upper value x as inf and Wrapped lower value x as -inf, wrapping will never occur.

Dependencies

Selecting this check box enables Wrapped upper value x and Wrapped lower value x.
**Programmatic Use**

**Block Parameter:** `WrapX`  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Wrapped upper value x — Upper value for wrapping x**  
pi (default) | scalar | vector | matrix

Specify the upper value for wrapping x.

**Dependencies**

To enable this parameter, select the **Wrap x** check box.

**Programmatic Use**

**Block Parameter:** `WrappedUpperValueX`  
**Type:** character vector, string  
**Values:** scalar | vector | matrix  
**Default:** 'pi'

**Wrapped lower value x — Lower value for wrapping x**  
-pi (default) | scalar | vector | matrix

Specify the lower value for wrapping x.

**Dependencies**

To enable this parameter, select the **Wrap x** check box.

**Programmatic Use**

**Block Parameter:** `WrappedLowerValueX`  
**Type:** character vector, string  
**Values:** scalar | vector | matrix  
**Default:** '-pi'

**Absolute tolerance x — Absolute tolerance for computing state x**  
auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state x.

- You can enter auto, -1, a positive real scalar or vector.
- If you enter auto or -1, Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute state x.
• If you enter a real scalar value, that value overrides the absolute tolerance in the Configuration Parameters dialog box and is used for computing all $x$ states.

• If you enter a real vector, the dimension of that vector must match the dimension of state $x$. These values override the absolute tolerance in the Configuration Parameters dialog box.

**Programmatic Use**

**Block Parameter:** AbsoluteToleranceX

**Type:** character vector; string

**Values:** 'auto' | '-1' | any positive real scalar or vector

**Default:** 'auto'

**State name $x$ — Name for state $x**

'' (default) | character vector | string

Assign a unique name to state $x$.

**Tips**

• To assign a name to a single state, enter the name between quotes, for example, 'position'.

• To assign names to multiple $x$ states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.

• The state names apply only to the selected block.

• If you specify a state name for $x$, you must also specify a state name for $dx/dt$.

• State names for $x$ and $dx/dt$ must have identical types and lengths.

• The number of states must be evenly divided by the number of state names. You can specify fewer names than $x$ states, but you cannot specify more names than $x$ states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for $dx/dt$.

• To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string or a cell array.

**Programmatic Use**

**Block Parameter:** StateNameX

**Type:** character vector; string

**Values:** '' | user-defined

**Default:** ''
**dx/dt**

**Initial condition source dx/dt** — Source of initial condition for state $dx/dt$

Specify the source of initial conditions for state $dx/dt$ as internal or external.

**Limitations**

Simulink software does not allow the initial condition of this block to be $\text{inf}$ or NaN.

**Dependencies**

- Selecting internal enables the **Initial condition dx/dt** parameter and removes the $dx_0$ input port.
- Selecting external disables the **Initial condition dx/dt** parameter and enables the $dx_0$ input port.

**Programmatic Use**

**Block Parameter:** ICSourceDXDT  
**Type:** character vector  
**Values:** 'internal' | 'external'  
**Default:** 'internal'

**Initial condition dx/dt** — Initial condition of state $dx/dt$

Specify the initial condition of state $dx/dt$.

**Limitations**

Simulink software does not allow the initial condition of this block to be $\text{inf}$ or NaN.

**Dependencies**

- Setting **Initial condition source dx/dt** to internal enables this parameter.
- Setting **Initial condition source dx/dt** to external disables this parameter.

**Programmatic Use**

**Block Parameter:** ICDXDT  
**Type:** character vector  
**Values:** scalar | vector | matrix  
**Default:** '0.0'
Limit $dx/dt$ — Limit values of state $dx/dt$
off | on

Limit the $dx/dt$ state of the block to a value between the Lower limit $dx/dt$ and Upper limit $dx/dt$ parameters. The default value of the Second-Order Integrator block is off. The default value of the Second-Order Integrator Limited is on.

Tip

If you set saturation limits for $x$, then the interval defined by the Upper limit $dx/dt$ and Lower limit $dx/dt$ must contain zero.

Dependencies

Selecting this check box enables the Upper limit $dx/dt$ and Lower limit $dx/dt$ parameters.

Programmatic Use
Parameter: LimitDXDT
Type: character vector
Values: 'off' | 'on'
Default: 'off' (Second-Order Integrator) | 'on' (Second-Order Integrator Limited)

Upper limit $dx/dt$ — Upper limit of state $dx/dt$
inf (default) | scalar | vector | matrix

Specify the upper limit for state $dx/dt$.

Dependencies

If you limit $x$, then this parameter must have a strictly positive value.

To enable this parameter, select the Limit $dx/dt$ check box.

Programmatic Use
Block Parameter: UpperLimitDXDT
Type: character vector
Values: scalar | vector | matrix
Default: 'inf'

Lower limit $dx/dt$ — Lower limit of state $dx/dt$
-$\infty$ (default) | scalar | vector | matrix

Specify the lower limit for state $dx/dt$. 
**Dependencies**

If you limit \( x \), then this parameter must have a strictly negative value.

To enable this parameter, select the **Limit \( dx/dt \)** check box.

**Programmatic Use**

**Block Parameter:** `LowerLimitDXDT`  
**Type:** character vector  
**Values:** scalar | vector | matrix  
**Default:** `-inf`

**Absolute tolerance \( dx/dt \) — Absolute tolerance for computing state \( dx/dt \)**  
auto (default) | -1 | scalar | vector

Specify the absolute tolerance for computing state \( dx/dt \).

- You can enter `auto`, –1, a positive real scalar or vector.
- If you enter `auto` or –1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute the \( dx/dt \) output of the block.
- If you enter a numeric value, that value overrides the absolute tolerance in the Configuration Parameters dialog box.

**Programmatic Use**

**Block Parameter:** `AbsoluteToleranceDXDT`  
**Type:** character vector, string, scalar, or vector  
**Values:** 'auto' | '-1' | any positive real scalar or vector  
**Default:** 'auto'

**State name \( dx/dt \) — Name for state \( dx/dt \)**  
' ' (default) | character vector | string

Assign a unique name to state \( dx/dt \).

**Tips**

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple \( dx/dt \) states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
• The state names apply only to the selected block.
• If you specify a state name for $dx/dt$, you must also specify a state name for $x$.
• State names for $x$ and $dx/dt$ must have identical types and lengths.
• The number of states must be evenly divided by the number of state names. You can specify fewer names than $dx/dt$ states, but you cannot specify more names than $dx/dt$ states. For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states. However, you must be consistent and apply the same scheme to the state names for $x$.
• To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, or a cell array.

**Programmatic Use**
**Block Parameter:** StateNameDXDT
**Type:** character vector, string
**Values:** ' ' | user-defined
**Default:** ' '

**Attributes**

**External reset — Reset states to their initial conditions**

none (default) | rising | falling | either

Reset the states to their initial conditions when a trigger event occurs in the reset signal.

• none — Do not reset the state to initial conditions.
• rising — Reset the state when the reset signal rises from a zero to a positive value or from a negative to a positive value.
• falling — Reset the state when the reset signal falls from a positive value to zero or from a positive to a negative value.
• either — Reset the state when the reset signal changes from zero to a nonzero value or changes sign.

**Programmatic Use**
**Block Parameter:** ExternalReset
**Type:** character vector, string
**Values:** 'none' | 'rising' | 'falling' | 'either'
**Default:** 'none'
Enable zero-crossing detection — Enable zero-crossing detection
on (default) | off

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection”.

**Programmatic Use**
**Parameter:** ZeroCross  
**Type:** character vector, string  
**Values:** 'on' | 'off'  
**Default:** 'on'

Reinitialize dx/dt when x reaches saturation — Reset dx/dt when x reaches saturation
off (default) | on

At the instant when state x reaches saturation, reset dx/dt to its current initial conditions.

**Tip**

The dx/dt initial condition must have a value that enables x to leave saturation immediately. Otherwise, Simulink ignores the initial conditions for dx/dt to preserve mathematical consistency of block states.

**Programmatic Use**
**Block Parameter:** ReinitDXDTwhenXreachesSaturation  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

Ignore state limits and the reset for linearization — Ignore state limits and external reset for linearization
off (default) | on

For linearization purposes, have Simulink ignore the specified state limits and the external reset.

**Programmatic Use**
**Block Parameter:** IgnoreStateLimitsAndResetForLinearization  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'
**Show output — Output ports to display**
both (default) | x | dx/dt

Specify the output ports on the block.

- **both** — Show both x and dx/dt output ports.
- **x** — Show only the x output port.
- **dx/dt** — Show only the dx/dt output port.

**Programmatic Use**

**Block Parameter:** ShowOutput  
**Type:** character vector, string  
**Values:** 'both' | 'x' | 'dxdt'  
**Default:** 'both'

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.
In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Selector

Select input elements from vector, matrix, or multidimensional signal

Library:  
Simulink / Signal Routing  
HDL Coder / Signal Routing

Description

The Selector block generates as output selected or reordered elements of an input vector, matrix, or multidimensional signal.

Based on the value you enter for the Number of input dimensions parameter, a table of indexing settings is displayed. Each row of the table corresponds to one of the input dimensions in Number of input dimensions. For each dimension, you define the elements of the signal to work with. Specify a vector signal as a 1-D signal and a matrix signal as a 2-D signal. When you configure the Selector block for multidimensional signal operations, the block icon changes.

For example, assume a 6-D signal with a one-based index mode. The table of the Selector block dialog changes to include one row for each dimension. If you define dimensions as shown in the next table, the output is $Y = U(1:end, 2:6, [1 \ 3 \ 5], \text{Idx4:Idx4+7, Idx5, Idx6(1):Idx6(2)})$, where Idx4, Idx5, and Idx6 are the index ports for dimensions 4, 5, and 6.

</tbody>
</table>
You can use an array of buses as an input signal to a Selector block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”.

## Ports

### Input

**Port_1 — Input signal**  
scalar | vector | matrix | multidimensional

Input signal and source of elements to output signal.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 |  
Boolean | fixed point | enumerated | bus

**IndxN — Nth index signal**  
scalar | vector | matrix

External port specifying an index for the selection of the corresponding output element.

### Dependencies

To enable an external index port, in the corresponding row of the **Index Option** table, set **Index Option** to Index vector (port), Starting index (port), or Starting and ending indices (port).

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | enumerated
Output

Port_1 — Output signal
scalar | vector | matrix | multidimensional

Output signal generated from selected or reordered elements of input signal.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Number of input dimensions — Number of dimensions of the input signal
1 (default) | integer

Specifies the number of dimensions of the input signal.

Programmatic Use
Block Parameter: NumberOfDimensions
Type: character vector
Values: integer
Default: '1'

Index mode — Index mode
One-based (default) | Zero-based

Specifies the indexing mode. If One-based is selected, an index of 1 specifies the first element of the input vector. If Zero-based is selected, an index of 0 specifies the first element of the input vector.

Programmatic Use
Block Parameter: IndexMode
Type: character vector
Values: 'One-based' | 'Zero-based'
Default: 'One-based'

Index Option — Index method for elements
Index vector (dialog) (default) | Select all | Index vector (port) |
Starting index (dialog) | Starting index (port) | Starting and ending indices (port)
Defines, by dimension, how the elements of the signal are to be indexed. From the list, select:

- **Select all**
  
  No further configuration is required. All elements are selected.

- **Index vector (dialog)**
  
  Enables the **Index** column. Enter the vector of indices of the elements. Do not select this option when the input signal is variable-sized.

- **Index vector (port)**
  
  No further configuration is required.

- **Starting index (dialog)**
  
  Enables the **Index** and **Output Size** columns. Enter the starting index of the range of elements to select in the **Index** column and the number of elements to select in the **Output Size** column. Do not select this option when the input signal is variable-sized.

- **Starting index (port)**
  
  Enables the **Output Size** column. Enter the number of elements to be selected in the **Output Size** column.

- **Starting and ending indices (port)**
  
  No further configuration is required.

Using this option results in a variable-size output signal. When you update, the output dimension is set to be the same as the input signal dimension. During execution, the output dimension is updated based on the signal feeding the index.

When logging output signal data, signals not selected are padded with NaN values.

The **Index** and **Output Size** columns appear as needed.

**Programmatic Use**

**Block Parameter:** IndexOptionArray

**Type:** character vector

**Values:** 'Select all' | 'Index vector (dialog)' | 'Index option (port)' | 'Starting index (dialog)' | 'Starting index (port)' | Starting and ending indices (port)
**Default:** 'Index vector (dialog)'

**Index — Index of elements**

1 (default) | integer

If the **Index Option** is Index vector (dialog), enter the index of each element you are interested in.

If the **Index Option** is Starting index (dialog), enter the starting index of the range of elements to be selected.

**Programmatic Use**

**Block Parameter:** `IndexParamArray`

**Type:** character vector

**Values:** cell array

**Default:** '{ }'

**Output Size — Width of the block output signal**

1 (default) | integer

Specifies the width of the block output signal.

**Programmatic Use**

**Block Parameter:** `OutputSizeArray`

**Type:** character vector

**Values:** cell array

**Default:** '{ }'

**Input port size — Width of the input signal**

3 (default) | integer

Specify the width of the block input signal for 1-D signals. Enter -1 to inherit from the driving block.

**Programmatic Use**

**Block Parameter:** `InputPortWidth`

**Type:** character vector

**Values:** integer

**Default:** '1'

**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector
Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar or vector  
**Default:** '-1'

Sequence Viewer

Display messages, events, states, transitions, and functions between blocks during simulation

Library: Simulink / Messages & Events
        Simulink Test
        SimEvents
        Stateflow

Description

The Sequence Viewer block displays messages, events, states, transitions, and functions between certain blocks during simulation. The blocks that you can display are called lifeline blocks and include:

- Subsystems
- Referenced models
- Blocks that contain messages, such as Stateflow charts
- Blocks that call functions or generate events, such as Function Caller, Function-Call Generator, and MATLAB Function blocks
- Blocks that contain functions, such as Function-Call Subsystem and Simulink Function blocks

To see states, transitions, and events for lifeline blocks in a referenced model, you must have a Sequence Viewer block in the referenced model. Without a Sequence Viewer block in the referenced model, you can see only messages and functions for lifeline blocks in the referenced model.

Parameters

Time Precision for Variable Step — Adjust time increment precision
3 (default)

When using a variable step solver, change this parameter to adjust the time precision for the sequence viewer.
Programmatic Use
Block Parameter: VariableStepTimePrecision
Type: character vector
Values: '3' | scalar
Default: '3'

History — Maximum number of events to keep in viewer
5000 (default)

Programmatic Use
Block Parameter: History
Type: character vector
Values: '1000' | scalar
Default: '1000'

**Introduced in R2015b**
S-Function

Include S-function in model
Library: Simulink / User-Defined Functions

Description

The S-Function block provides access to S-functions from a block diagram. The S-function named as the S-function name parameter can be a Level-2 MATLAB or a Level-1 or Level-2 C MEX S-function (see “MATLAB S-Function Basics” for information on how to create S-functions).

Note Use the Level-2 MATLAB S-Function block to include a Level-2 MATLAB S-function in a block diagram.

The S-Function block displays the name of the specified S-function and the number of input and output ports specified by the S-function. Signals connected to the inputs must have the dimensions specified by the S-function for the inputs.

Parameters

S-function name — Name of the S-function
character array (default)

Use this parameter to specify the name of your S-function.

Programmatic Use
Block Parameter: FunctionName
Type: character vector
Value: name of the S-function
Default: 'system'
S-function parameters — Additional S-function parameters

cell array (default)

Specify the additional S-function parameters.

The function parameters can be specified as MATLAB expressions or as variables separated by commas. For example,

A, B, C, D, [eye(2,2);zeros(2,2)]

Note that although individual parameters can be enclosed in brackets, the list of parameters must not be enclosed in brackets.

Programmatic Use
Block Parameter: Parameters
Type: character vector
Value: S-function parameters
Default: ''

S-function modules — List additional files for code generation

cell array (default)

This parameter applies only if this block represents a C MEX S-function and you intend to use the Simulink Coder software to generate code from the model containing the block. If you use it, when you are ready to generate code, you must force the coder to rebuild the top model as explained in “Control Regeneration of Top Model Code” (Simulink Coder).

For more information on using this parameter, see “Specify Additional Source Files for an S-Function” (Simulink Coder).

Programmatic Use
Block Parameter: SFunctionModules
Type: character vector
Value: character vector of file names
Default: ''

\(^a\) Actual data type or capability support depends on block implementation.
\(^b\) See Writing Fixed-Point S-Functions for details on using fixed-point data types in S-functions.

### Extended Capabilities

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

- Actual code generation support depends on block implementation.
- S-functions that call into MATLAB are not supported for code generation.

**Fixed-Point Conversion**

Design and simulate fixed-point systems using Fixed-Point Designer™.

- Actual data type support depends on block implementation.
- See “Integrate External Code” (Fixed-Point Designer) for details on using fixed-point data types in S-functions.

### Topics

“Implementing S-Functions”
“Create a Basic C MEX S-Function”
“Write Level-2 MATLAB S-Functions”

Introduced before R2006a
**S-Function Builder**

Integrate C or C++ code to create S-functions

**Library:** Simulink / User-Defined Functions

---

**Description**

The S-function builder integrates new or existing C or C++ code and creates a C MEX S-function from specifications you provide. See “Build S-Functions Automatically” for detailed instructions on using the S-Function Builder block to generate an S-function.

Instances of the S-Function Builder block also serve as wrappers for generated S-functions in Simulink models. When simulating a model containing instances of an S-Function Builder block, Simulink software invokes the generated S-function in order to call your C or C++ code in the instance's `mdlStart`, `mdlOutputs`, `mdlDerivatives`, `mdlUpdate` and `mdlTerminate` methods. To learn how Simulink engine interacts with S-functions, see “Simulink Engine Interaction with C S-Functions”.

**Note** The S-Function Builder block does not support masking. However, you can mask a Subsystem block that contains an S-Function Builder block. For more information, see “Dynamic Masked Subsystem”.

---

**Ports**

**Input**

**In — Input to an S-function builder**

scalar | vector | matrix
The S-Function Builder can accept and complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Output**

**Out — Output from an S-function builder**

scalar | vector | matrix

The S-Function Builder can output complex, 1-D, or 2-D signals and nonvirtual buses. For each of these cases, the signals must have a data type that Simulink supports.

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Parameters**

See “S-Function Builder Dialog Box” in the online documentation for information on using the S-Function Builder block's parameter dialog box.

Shift Arithmetic

Shift bits or binary point of signal

\[
\begin{align*}
Q_y &= Qu >> 8 \\
V_y &= Vu * 2^8 \\
E_y &= Eu
\end{align*}
\]

Library

Logic and Bit Operations

Description

Supported Shift Operations

The Shift Arithmetic block can shift the bits or the binary point of an input signal, or both.

For example, shifting the binary point on an input of data type \texttt{sfix(8)}, by two places to the right and left, gives these decimal values.

<table>
<thead>
<tr>
<th>Shift Operation</th>
<th>Binary Value</th>
<th>Decimal Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>No shift (original number)</td>
<td>11001.011</td>
<td>−6.625</td>
</tr>
<tr>
<td>Binary point shift right by two places</td>
<td>1100101.1</td>
<td>−26.5</td>
</tr>
<tr>
<td>Binary point shift left by two places</td>
<td>110.01011</td>
<td>−1.65625</td>
</tr>
</tbody>
</table>

This block performs arithmetic bit shifts on signed numbers. Therefore, the block recycles the most significant bit for each bit shift. Shifting the bits on an input of data type \texttt{sfix(8)}, by two places to the right and left, gives these decimal values.

<table>
<thead>
<tr>
<th>Shift Operation</th>
<th>Binary Value</th>
<th>Decimal Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>No shift (original number)</td>
<td>11001.011</td>
<td>−6.625</td>
</tr>
<tr>
<td>Bit shift right by two places</td>
<td>11110.010</td>
<td>−1.75</td>
</tr>
</tbody>
</table>
### Shift Operation

<table>
<thead>
<tr>
<th>Shift Operation</th>
<th>Binary Value</th>
<th>Decimal Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit shift left by two places</td>
<td>00101.100</td>
<td>5.5</td>
</tr>
</tbody>
</table>

### Data Type Support

The block supports input signals of the following data types:

<table>
<thead>
<tr>
<th>Input Signal</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>• Floating point</td>
</tr>
<tr>
<td></td>
<td>• Built-in integer</td>
</tr>
<tr>
<td></td>
<td>• Fixed point</td>
</tr>
<tr>
<td>s</td>
<td>• Floating point</td>
</tr>
<tr>
<td></td>
<td>• Built-in integer</td>
</tr>
<tr>
<td></td>
<td>• Fixed-point integer</td>
</tr>
</tbody>
</table>

The following rules determine the output data type:

<table>
<thead>
<tr>
<th>Data Type of Input</th>
<th>Output Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>Same as input u</td>
</tr>
<tr>
<td>Floating point</td>
<td></td>
</tr>
<tr>
<td>Built-in integer or fixed point</td>
<td>• Sign of u</td>
</tr>
<tr>
<td></td>
<td>• Word length of u</td>
</tr>
<tr>
<td></td>
<td>• Slope of $u \times 2^{(\text{max(binary points to shift)})}$</td>
</tr>
<tr>
<td></td>
<td>• Bias of $u \times 2^{(\text{max(binary points to shift} - \text{bits to shift})}$, for bit shifts where the direction is bidirectional or right</td>
</tr>
<tr>
<td></td>
<td>• Bias of $u \times 2^{(\text{max(binary points to shift} + \text{bits to shift})}$, for bit shifts where the direction is left</td>
</tr>
</tbody>
</table>

The block parameters support the following data types:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits to shift: Number</td>
<td>• Built-in integer</td>
</tr>
<tr>
<td></td>
<td>• Fixed-point integer</td>
</tr>
<tr>
<td>Binary points to shift</td>
<td>• Built-in integer</td>
</tr>
<tr>
<td></td>
<td>• Fixed-point integer</td>
</tr>
</tbody>
</table>

For more information, see “Data Types Supported by Simulink” in the Simulink documentation.

**Parameters**

**Bits to shift: Source**

Specify whether to enter the bits to shift on the dialog box or to inherit the values from an input port.

**Bits to shift: Direction**

Specify the direction in which to shift bits: left, right, or bidirectional.

**Bits to shift: Number**

Specify a scalar, vector, or array of bit shift values. This parameter is available when **Bits to shift: Source** is Dialog.

<table>
<thead>
<tr>
<th>If the direction is...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left or Right</td>
<td>Use positive integers to specify bit shifts.</td>
</tr>
<tr>
<td>Bidirectional</td>
<td>Use positive integers for right shifts and negative integers for left shifts.</td>
</tr>
</tbody>
</table>

**Binary points to shift**

Specify an integer number of places to shift the binary point of the input signal. A positive value indicates a right shift, while a negative value indicates a left shift.

**Diagnostic for out-of-range shift value**

Specify whether to produce a warning or error during simulation when the block contains an out-of-range shift value. Options include:

- None — Simulink software takes no action.
- **Warning** — Simulink software displays a warning and continues the simulation.
- **Error** — Simulink software terminates the simulation and displays an error

For more information, see “Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values” on page 1-1818.

**Check for out-of-range 'Bits to shift' in generated code**

Select this check box to include conditional statements in the generated code that protect against out-of-range bit shift values. This check box is available when **Bits to shift**: **Source** is **Input port**.

For more information, see “Code Generation for Out-of-Range Bit Shift Values” on page 1-1820.

**Out-of-Range Bit Shifts**

**Definition of an Out-of-Range Bit Shift**

Suppose that **WL** is the input word length. The shaded regions in the following diagram show out-of-range bit shift values for left and right shifts.

Similarly, the shaded regions in the following diagram show out-of-range bit shift values for bidirectional shifts.
The diagnostic for out-of-range bit shifts responds as follows, depending on the mode of operation:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Diagnostic for out-of-range shift value</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Do not report any warning or error.</td>
</tr>
<tr>
<td>Warning</td>
<td>Report a warning but continue simulation.</td>
</tr>
<tr>
<td>Error</td>
<td>Report an error and stop simulation.</td>
</tr>
<tr>
<td>Simulation</td>
<td></td>
</tr>
<tr>
<td>Accelerator modes and code generation</td>
<td>Has no effect.</td>
</tr>
</tbody>
</table>

**Simulation and Accelerator Mode Results for Out-of-Range Bit Shift Values**

Suppose that $U$ is the input, $WL$ is the input word length, and $Y$ is the output. The output for an out-of-range bit shift value for left shifts is as follows:
Similarly, the output for an out-of-range bit shift value for right shifts is as follows:

For bidirectional shifts, the output for an out-of-range bit shift value is as follows:
Code Generation for Out-of-Range Bit Shift Values

For the generated code, the method for handling out-of-range bit shifts depends on the setting of **Check for out-of-range ‘Bits to shift’ in generated code**.

<table>
<thead>
<tr>
<th>Check Box Setting</th>
<th>Generated Code</th>
<th>Simulation Results Compared to Generated Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>Includes conditional statements to protect against out-of-range bit shift values.</td>
<td>Simulation and Accelerator mode results match those of code generation.</td>
</tr>
</tbody>
</table>
| Cleared           | Does not protect against out-of-range bit shift values. | • For in-range values, simulation and Accelerator mode results match those of code generation.  
                      |                                                      | • For out-of-range values, the code generation results are compiler specific.        |

For right shifts on signed negative inputs, most C compilers use an arithmetic shift instead of a logical shift. Generated code for the Shift Arithmetic block depends on this compiler behavior.
Examples

Block Output for Right Bit Shifts

The following model compares the behavior of right bit shifts using the dialog box versus the block input port.

The key block parameter settings of the Constant blocks are:

<table>
<thead>
<tr>
<th>Block</th>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant and Constant1</td>
<td>Constant value</td>
<td>124</td>
</tr>
<tr>
<td></td>
<td>Output data type</td>
<td>int8</td>
</tr>
<tr>
<td>Dynamic bit shift</td>
<td>Constant value</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>Output data type</td>
<td>Inherit: Inherit from 'Constant value'</td>
</tr>
</tbody>
</table>

The key block parameter settings of the Shift Arithmetic blocks are:

<table>
<thead>
<tr>
<th>Block</th>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit shift from dialog</td>
<td>Bits to shift: Source</td>
<td>Dialog</td>
</tr>
<tr>
<td></td>
<td>Bits to shift: Direction</td>
<td>Right</td>
</tr>
<tr>
<td></td>
<td>Bits to shift: Number</td>
<td>2</td>
</tr>
</tbody>
</table>
The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the number of bits two places to the right produces 00011111 in binary format. Therefore, the block outputs 31.

The bottom Shift Arithmetic block performs the same operation as the top block. However, the bottom block receives the bit shift value through an input port instead of the dialog box. By supplying this value as an input signal, you can change the number of bits to shift during simulation.

**Block Output for Binary Point Shifts**

The following model shows the effect of binary point shifts.

<table>
<thead>
<tr>
<th>Block</th>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit shift from input</td>
<td>Bits to shift: Source</td>
<td>Input port</td>
</tr>
<tr>
<td></td>
<td>Bits to shift: Direction</td>
<td>Right</td>
</tr>
</tbody>
</table>

The key block parameter settings of the Constant blocks are:

<table>
<thead>
<tr>
<th>Block</th>
<th>Parameter</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant and Constant1</td>
<td>Constant value</td>
<td>124</td>
</tr>
<tr>
<td></td>
<td>Output data type</td>
<td>int8</td>
</tr>
</tbody>
</table>

The key block parameter settings of the Shift Arithmetic blocks are:
The top Shift Arithmetic block takes an input of 124, which corresponds to 01111100 in binary format. Shifting the binary point three places to the right produces 01111100000 in binary format. Therefore, the top block outputs 995.

The bottom Shift Arithmetic block also takes an input of 124. Shifting the binary point three places to the left produces 01111.100 in binary format. Therefore, the bottom block outputs 15.5.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

You can generate HDL code when **Bits to shift: Source** is **Dialog** or **Input port**.

**HDL Architecture**

The generated VHDL code uses the `shift_right` function and `sll` operator.

The generated Verilog code uses the `>>>` and `<<<` shift operators.

**HDL Block Properties**

<table>
<thead>
<tr>
<th>ConstraintedOutput Pipeline</th>
<th>Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstraintedOutputPipeline” (HDL Coder).</th>
</tr>
</thead>
<tbody>
<tr>
<td>InputPipeline</td>
<td>Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Complex Data Support**

This block supports code generation for complex signals.
Restrictions

When **Bits to shift: Source** is **Input port**, binary point shifting is not supported.

PLC Code Generation
Generates Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Design and simulate fixed-point systems using Fixed-Point Designer™.

*Introduced before R2006a*
Sign

Indicate sign of input

Library: Simulink / Math Operations
        HDL Coder / HDL Floating Point Operations
        HDL Coder / Math Operations

Description

Block Behavior for Real Inputs

For real inputs, the Sign block outputs the sign of the input:

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than zero</td>
<td>1</td>
</tr>
<tr>
<td>Equal to zero</td>
<td>0</td>
</tr>
<tr>
<td>Less than zero</td>
<td>-1</td>
</tr>
</tbody>
</table>

For vector and matrix inputs, the block outputs a vector or matrix where each element is the sign of the corresponding input element, as shown in this example:

Block Behavior for Complex Inputs

When the input \( u \) is a complex scalar, the block output matches the MATLAB result for:

\[
\text{sign}(u) = \frac{u}{\text{abs}(u)}
\]
When an element of a vector or matrix input is complex, the block uses the same formula that applies to scalar input, as shown in this example:

**Ports**

**Input**

**Port_1 — Input signal**
scalar | vector | matrix

Input signal whose sign will determine the output.

The block supports complex input signals only for floating-point data types, double and single.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**Port_1 — Output signal**
scalar | vector | matrix

Output signal that is the sign of the input signal.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point
Parameters

Enable zero-crossing detection — Enable zero-crossing detection
on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector, string
Values: 'off' | 'on'
Default: 'on'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar or vector
Default: '-1'

Signal Builder

Create and generate interchangeable groups of signals whose waveforms are piecewise linear
Library: Simulink / Sources

Description

**Note** The Signal Builder block is not recommended. Use the Signal Editor block instead.

The Signal Builder block allows you to create interchangeable groups of piecewise linear signal sources and use them in a model. You can quickly switch the signal groups into and out of a model to facilitate testing. In the Signal Builder window, create signals and define the output waveforms. To open the window, double-click the block. See “Signal Groups”.

**Note** Use the `signalbuilder` function to create and access Signal Builder blocks programmatically.

Ports

Output

**Signal 1 — First output signal**
scalar | vector | matrix

First output signal from the signal group currently visible in the Signal Builder window.

Data Types: double | bus

**Signal n — nth output signal**
scalar | vector | matrix
nth output signal from the signal group currently visible in the Signal Builder window. n corresponds to the signal index.

Data Types: double | bus

### Block Characteristics

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>

Signal Conversion

Convert signal to new type without altering signal values

Library: Simulink / Signal Attributes
HDL Coder / Signal Attributes

Description

The Signal Conversion block converts a signal from one type to another. To select the type of conversion to perform, use the Output parameter or one of these preconfigured Signal Conversion blocks:

- Signal Copy block
- To Virtual Bus block
- To Nonvirtual Bus block

Ports

Input

Port_1 — Input signal to convert
scalar | vector | matrix | N-D array

Input signal to convert, specified as a scalar, vector, matrix, or N-D array.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Converted signal
scalar | vector | matrix | N-D array

Output signal is the input signal converted to the specified type.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Output — Type of conversion
Signal copy (default) | Virtual bus | Nonvirtual bus

Specify the type of conversion to perform. The type of conversion that you use depends on your modeling goal.

<table>
<thead>
<tr>
<th>Modeling Goal</th>
<th>Output Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reduce generated code for a muxed signal.</td>
<td>Signal copy</td>
</tr>
<tr>
<td>For an example involving Simulink Coder software, see “Generate Reentrant Code from Subsystems” (Simulink Coder).</td>
<td></td>
</tr>
<tr>
<td>Connect a block with a constant sample time to an output port of an enabled subsystem.</td>
<td>Signal copy</td>
</tr>
<tr>
<td>Pass a bus, or array of buses, whose components have different data types to a nonvirtual Inport block in an atomic subsystem that has direct feedthrough.</td>
<td>Signal copy</td>
</tr>
<tr>
<td>For more information, see “Use Buses with Atomic Subsystem Nonvirtual Inport Blocks”.</td>
<td></td>
</tr>
<tr>
<td>Save memory by converting a nonvirtual bus to a virtual bus.</td>
<td>Virtual bus</td>
</tr>
<tr>
<td>Pass a virtual bus to a modeling construct that requires a nonvirtual bus, such as a Model block.</td>
<td>Nonvirtual bus</td>
</tr>
</tbody>
</table>

- The Signal copy option is the default. The type of conversion that the Signal Conversion block performs using the Signal copy option depends on the type of input signal.
<table>
<thead>
<tr>
<th>Type of Input Signal</th>
<th>Conversion That the Signal Copy Option Performs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Muxed (nonbus) signal</td>
<td>Converts the muxed signal, whose elements occupy discontiguous areas of memory, to a vector signal, whose elements occupy contiguous areas of memory. The conversion allocates a contiguous area of memory for the elements of the muxed signal and copies the values from the discontiguous areas (represented by the block input) to the contiguous areas (represented by the block output) at each time step.</td>
</tr>
<tr>
<td>Bus</td>
<td>Outputs a contiguous copy of the bus that is the input to the Signal Conversion block.</td>
</tr>
</tbody>
</table>

For an array of buses input signal, use the Signal copy option.

- The Virtual bus option converts a nonvirtual bus to a virtual bus.
- The Nonvirtual bus option converts a virtual bus to a nonvirtual bus.

**Programmatic Use**

**Block Parameter:** ConversionOutput  
**Type:** character vector  
**Values:** 'Signal copy' | 'Virtual bus' | 'Nonvirtual bus'  
**Default:** 'Signal copy'

**Data type — Nonvirtual bus data type**

Inherit: auto (default) | Bus: <object name> | <data type expression>

Specify the output data type of the nonvirtual bus that the Signal Conversion block produces.

This option is available only when you set the **Output** parameter to Nonvirtual bus.

The default option is Inherit: auto, which uses a rule that inherits a data type.

Specify a Simulink.Bus object in the **Data type** parameter for one or both of the following blocks:
- Signal Conversion block
- An upstream Bus Creator block

If you specify a bus object for the Signal Conversion block, but not for its upstream Bus Creator block, then use a bus object that matches the hierarchy of the bus that upstream Bus Creator block outputs.

If you specify a bus object for both the Signal Conversion block and its upstream Bus Creator block, use the same bus object for both blocks.

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Dependencies**

To enable this parameter, set Output to Nonvirtual bus.

**Programmatic Use**

- **Block Parameter:** OutDataTypeStr
  - **Type:** character vector
  - **Values:** 'Inherit: auto' | 'Bus: <object name>' | '<data type expression>'
  - **Default:** 'Inherit: auto'

**Exclude this block from 'Block reduction' optimization — Exclude from block reduction optimization**

- **off** (default) | **on**

This option is available only when you set the Output parameter to Signal copy. If the elements of the input signal occupy contiguous areas of memory, then as an optimization, Simulink software eliminates the block from the compiled model. If you select the Exclude this block from 'Block reduction' optimization check box, the optimization occurs the next time you compile the model. For more information, see “Block reduction”.

**Programmatic Use**

- **Block Parameter:** OverrideOpt
  - **Type:** character vector
  - **Values:** 'off' | 'on'
  - **Default:** 'off'

Introduced before R2006a
Signal Editor

Display, create, edit, and switch interchangeable scenarios

Library: Simulink / Sources

Description

The Signal Editor block displays, creates, and edits interchangeable scenarios. You can also use the block to switch scenarios in and out of models.

The Signal Editor block supports MAT-files that contain one or more scalar Simulink.SimulationData.Dataset objects.

You can port Signal Builder block configurations to the Signal Editor block using the signalBuilderToSignalEditor function. For more information, see “Replace Signal Builder Block with Signal Editor Block”.

To programmatically get the total number of scenarios and signals in the Signal Editor block, use the get_param NumberOfScenarios and NumberOfSignals properties. These properties contain the values as character vectors. To convert these values to doubles, use the str2double function.

To programmatically enable the Signal Editor block to label output signal lines, set the set_param PreserveSignalName to 'on' (default). For example:

set_param(gcb,'PreserveSignalName','on')

Limitations

The Signal Editor block does not support:

- Function-calls
- Array of buses
• Buses while using rapid accelerator mode
• timetable objects
• Ground signals

The Signal Editor block supports dynamic strings. It does not support strings with maximum length. In addition, strings in the Signal Editor block cannot output:

• Non-scalar MATLAB strings.
• String data that contains missing values.
• String data that contains non-ASCII characters.

Ports

Output Arguments

Signal1 — Signals in scenario
multidimensional

One or more signals, which can be:

• A MATLAB timeseries object
• A structure of MATLAB timeseries objects
• A two-dimensional matrix

The port label depends on the associated variable in the data set MAT-file.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | string | fixed point | enumerated | bus

Parameters

File name — Data set file
untitled.mat (default) | character vector

Data set file, specified as character vector, containing one or more scalar Simulink.SimulationData.Dataset objects. Do not use a file name from one locale
in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

**Dependencies**

- If `untitled.mat` does not exist in the current folder, these parameters are disabled:
  - **Active scenario**
  - **Signals**
  - **Output a bus signal**
  - **Unit**
  - **Sample time**
  - **Interpolate data**
  - **Enable zero-crossing detection**
  - **Form output after final data value by**

To create a MAT-file, click ![Create MAT-file](image). This button starts the Signal Editor user interface, which lets you create and edit scenario MAT-files.

**Programmatic Use**

**Block Parameter:** Filename  
**Type:** character vector  
**Values:** character vector  
**Default:** 'untitled.mat'

**Active scenario — Active scenario**

**Scenario (default) | character vector**

Active scenario, specified as a character vector. The specified MAT-file must exist.

**Dependencies**

- To enable this parameter, ensure that the specified MAT-file exists.
- With fast restart enabled, you can:
  - Change the active scenario
  - Change the active signal
  - Start the Signal Editor user interface and edit data
While you can change the active signal, you cannot edit the signal properties in the block.

**Programmatic Use**

**Block Parameter:** ActiveScenario  
**Type:** character vector | numeric  
**Values:** character vector | index value  
**Default:** 'Scenario'

To create and edit scenarios, launch Signal Editor user interface —  
**Start Signal Editor** button click

To start Signal Editor user interface, click .

**Active signal — Signal to configure**  
**Signal 1 (default) | character vector**

Signal to configure, specified as a signal name. This signal is considered the active signal. The MAT-file must exist before you can configure signals.

To enable this parameter, ensure that the specified MAT-file exists.

**Tip** Do not use the set_param function to set the active signal property Name-Value argument ('ActiveSignal') in combination with another Name-Value pair argument for the Signal Editor block.

**Programmatic Use**

**Block Parameter:** ActiveSignal  
**Type:** character vector | numeric  
**Values:** character vector | index vector  
**Default:** 'Signal 1'

**Output a bus signal — Configure signal as bus**  
**off (default) | on**

Configure signal as a bus:

**On**  
Configure signal as a bus.
Off

Do not configure signal as a bus.

The specified MAT-file must exist.

**Tip** Select this check box only if the active signal is a MATLAB structure whose fields are the same as an existing, or create a new matching object. If you select this check box for an active signal that is not a MATLAB structure, simulation returns an error.

**Dependencies**

- Selecting **Output a bus signal** check box enables the **Select bus object** parameter.
- To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

<table>
<thead>
<tr>
<th>Block Parameter:</th>
<th>IsBus</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>character vector</td>
</tr>
<tr>
<td><strong>Values:</strong></td>
<td>'off'</td>
</tr>
<tr>
<td><strong>Default:</strong></td>
<td>'off'</td>
</tr>
</tbody>
</table>

**Select bus object — Bus object**

| Bus:       | BusObject (default) | bus object name |

Select or enter the bus object name. To edit the bus object or create a bus object using the Data Type Assistant, click `>>`. The active signal must be a MATLAB structure whose fields are the same as this bus object. The specified MAT-file must exist.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

<table>
<thead>
<tr>
<th>Block Parameter:</th>
<th>OutputBusObjectStr</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>character vector</td>
</tr>
<tr>
<td><strong>Values:</strong></td>
<td>bus object name</td>
</tr>
<tr>
<td><strong>Default:</strong></td>
<td>'Bus: BusObject'</td>
</tr>
</tbody>
</table>

**Mode — Bus object mode**

| Bus Object (default) | bus object data type |

1-1844
Select the bus object name. If you do not have a bus object, create one by clicking **Edit**, which starts the Bus Editor. For more information, see “Create and Specify Bus Objects”.

**Unit — Physical unit**

*inherit* (default) | supported physical unit

Physical unit of the signal, specified as an allowed unit. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For more information, see “Unit Specification in Simulink Models”. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

- If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.
- If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

The specified MAT-file must exist.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

**Block Parameter:** Unit

**Type:** character vector

**Values:** 'inherit' | supported physical unit

**Default:** 'inherit'

**Sample time — Time interval between samples**

0 (default) | -1 | sample time in seconds

Time interval between samples, specified in seconds. The specified MAT-file must exist.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

**Block Parameter:** SampleTime

**Type:** character vector
Values: -1 | sample time in seconds

Default: '0'

Interpolate data — Linearly interpolate data

off (default) | on

Linearly interpolate data at time hits for which no corresponding workspace data exist. The specified MAT-file must exist.

The Signal Editor block linearly interpolates:

- **On**
  - Linearly interpolate at time hits for which no corresponding workspace data exist, select this option.

- **Off**
  - The current output equals the output at the most recent time for which data exists.

The Signal Editor block interpolates by using the two corresponding workspace samples:

- For **double** data, linearly interpolates the value by using the two corresponding samples
- For **Boolean** data, uses false for the first half of the time between two time values and true for the second half
- For a built-in data type other than **double** or **Boolean**:
  - Upcasts the data to **double**
  - Performs linear interpolation (as described for **double** data)
  - Downcasts the interpolated value to the original data type

You cannot use linear interpolation with enumerated (**enum**) data.

The block uses the value of the last known data point as the value of time hits that occur after the last known data point.

To determine the block output after the last time hit for which data is available, combine the settings of these parameters:

- Interpolate data
• Form output after final data value by

For details, see the **Form output after final data value by** parameter.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

**Block Parameter:** Interpolate

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

**Enable zero-crossing detection — Detect zero-crossings**

**off** (default) | **on**

If you select the **Enable zero-crossing detection** parameter, then when the input array contains multiple entries for the same time hit, Simulink detects a zero crossing. For example, suppose that the input array has this data:

```
time:     0 1 2 2 3
signal:   2 3 4 5 6
```

At time 2, there is a zero crossing from input signal discontinuity. For more information, see “Zero-Crossing Detection”.

For bus signals, Simulink detects zero crossings across all leaf bus elements.

The specified MAT-file must exist.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

**Block Parameter:** ZeroCross

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

**Form output after final data value by — Block output after the last time hit for which data is available**

Setting to zero (default) | **Extrapolation** | **Holding final value**
To determine the block output after the last time hit for which workspace data is available, combine the settings of these parameters:

- **Interpolate data**
- **Form output after final data value by**

This table lists the block output, based on the values of the two options.

<table>
<thead>
<tr>
<th>Setting for Form Output After Final Data Value By</th>
<th>Setting for Interpolate Data</th>
<th>Block Output After Final Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extrapolation</td>
<td>On</td>
<td>Extrapolated from final data value</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>Error</td>
</tr>
<tr>
<td>Setting to zero</td>
<td>On</td>
<td>Zero</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>Zero</td>
</tr>
<tr>
<td>Holding final value</td>
<td>On</td>
<td>Final value from workspace</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>Final value from workspace</td>
</tr>
</tbody>
</table>

For example, the block uses the last two known data points to extrapolate data points that occur after the last known point if you:

- Select **Interpolate data**.
- Set **Form output after final data value by** to **Extrapolation**.

The specified MAT-file must exist.

**Dependencies**

To enable this parameter, ensure that the specified MAT-file exists.

**Programmatic Use**

**Block Parameter:** OutputAfterFinalValue  
**Type:** character vector  
**Values:** 'Setting to zero' | 'Extrapolation' | 'Holding final value'  
**Default:** 'Setting to zero'

Signal Generator

Generate various waveforms

Library: Simulink / Sources

Description

Supported Operations

The Signal Generator block can produce one of four different waveforms:

- sine
- square
- sawtooth
- random

You can express signal parameters in hertz or radians per second. Using default parameter values, you get one of the following waveforms:
<table>
<thead>
<tr>
<th>Waveform</th>
<th>Scope Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sine wave</td>
<td><img src="image" alt="Sine Wave Graph" /></td>
</tr>
<tr>
<td>Waveform</td>
<td>Scope Output</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Square wave</td>
<td>![Scope Output Image]</td>
</tr>
</tbody>
</table>

![Scope Output Image]
<table>
<thead>
<tr>
<th>Waveform</th>
<th>Scope Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sawtooth wave</td>
<td><img src="image" alt="Sawtooth wave graph" /></td>
</tr>
</tbody>
</table>
A negative **Amplitude** parameter value causes a 180-degree phase shift. You can generate a phase-shifted wave at other than 180 degrees in many ways. For example, you can connect a Clock block signal to a MATLAB Function block and write the equation for the specific wave.

You can vary the output settings of the Signal Generator block while a simulation is in progress to determine quickly the response of a system to different types of inputs.

The **Amplitude** and **Frequency** parameters determine the amplitude and frequency of the output signal. The parameters must be of the same dimensions after scalar expansion. If you clear the **Interpret vector parameters as 1-D** check box, the block outputs a signal of the same dimensions as the **Amplitude** and **Frequency** parameters (after scalar expansion). If you select the **Interpret vector parameters as 1-D** check box, the block outputs a vector (1-D) signal if the **Amplitude** and **Frequency** parameters are row or column vectors, that is, single-row or column 2-D arrays. Otherwise, the block outputs a signal of the same dimensions as the parameters.
Solver Considerations

If your model uses a fixed-step solver, Simulink uses the same step size for the entire simulation. In this case, the Signal Generator block output provides a uniformly sampled representation of the ideal waveform.

If your model uses a variable-step solver, Simulink might use different step sizes during the simulation. In this case, the Signal Generator block output does not always provide a uniformly sampled representation of the ideal waveform. To ensure that the block output is a uniformly sampled representation, add a Hit Crossing block directly downstream of the Signal Generator block. These models show the difference in Signal Generator block output with and without the Hit Crossing block.

Ports

Output

Port_1 — Generated output signal
scalar | vector | matrix

Output signal specified as one of these waveforms.
• sine
• square
• sawtooth
• random

Data Types: double

Parameters

Wave form — Wave form to generate
sine (default) | square | sawtooth | random

Specify the wave form.

Programmatic Use
Block Parameter: WaveForm
Type: character vector
Values: 'sine' | 'square' | 'sawtooth' | 'random'
Default: 'sine'

Time (t) — Source of time variable
Use simulation time (default) | Use external signal

Specify whether to use simulation time or an external signal as the source of values for the waveform time variable. If you specify an external source, the block displays an input port for connecting the source.

Programmatic Use
Block Parameter: TimeSource
Type: character vector
Values: 'Use simulation time' | 'Use external signal'
Default: 'Use simulation time'

Amplitude — Signal amplitude
1 (default) | scalar | vector | matrix

Specify the amplitude of the generated waveform.

Programmatic Use
Block Parameter: Amplitude
Type: character vector
Values: real scalar
Default: '1'

**Frequency — Signal frequency**
1 (default) | scalar | vector | matrix

Specify the frequency of the generated waveform.

**Programmatic Use**
**Block Parameter:** Frequency
Type: character vector
Values: real scalar
Default: '1'

**Units — Signal units**
rad/sec (default) | Hertz

Specify the signal units as Hertz or rad/sec.

**Programmatic Use**
**Block Parameter:** Units
Type: character vector
Values: 'rad/sec' | 'Hertz'
Default: 'rad/sec'

**Interpret vector parameters as 1-D — Treat vectors as 1-D**
on (default) | off

Select this check box to output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

- When you select this check box, the block outputs a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.
- When you clear this check box, the block does not output a vector of length N if the **Constant value** parameter evaluates to an N-element row or column vector.

**Programmatic Use**
**Block Parameter:** VectorParams1D
Type: character vector
Values: 'on' | 'off'
Default: 'on'

Signal Specification

Specify desired dimensions, sample time, data type, numeric type, and other attributes of signal

Library: Simulink / Signal Attributes
        HDL Coder / Signal Attributes

Description

The Signal Specification block allows you to specify the attributes of the signal connected to its input and output ports. If the specified attributes conflict with the attributes specified by the blocks connected to its ports, Simulink software displays an error when it compiles the model. For example, at the beginning of a simulation, if no conflict exists, Simulink eliminates the Signal Specification block from the compiled model. In other words, the Signal Specification block is a virtual block. It exists only to specify the attributes of a signal and plays no role in the simulation of the model.

You can use the Signal Specification block to ensure that the actual attributes of a signal meet desired attributes. For example, suppose that you and a colleague are working on different parts of the same model. You use Signal Specification blocks to connect your part of the model with your colleague’s. If your colleague changes the attributes of a signal without informing you, the attributes entering the corresponding Signal Specification block do not match. When you try to simulate the model, you get an error.

You can also use the Signal Specification block to ensure correct propagation of signal attributes throughout a model. However, if some blocks have unspecified attributes for the signals they accept or output, the model does not have enough information to propagate attributes correctly. In these cases, the Signal Specification block can provide the information Simulink needs. Using the Signal Specification block also helps speed up model compilation when blocks are missing signal attributes.

The Signal Specification block supports signal label propagation.
**Ports**

**Input**

**Port_1 — Input signal**

scalar | vector | matrix | N-D array

Input signal whose attributes to check, specified as a scalar, vector, matrix, or N-D array. The block checks the attributes of the input signal against the desired attributes you specify in the block dialog box. If the attributes do not match, the block generates an error.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Output**

**Port_1 — Output signal**

scalar | vector | matrix | N-D array

Output signal is the input signal when all attributes of the signal match those specified in the dialog box. If the attributes do not match, the block generates an error.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Parameters**

**Minimum — Minimum value for range checking**

[] (default) | scalar

Specify the minimum value for the block output as a finite real double scalar value.

**Note** If you specify a bus object as the data type for this block, do not set the minimum value for bus data on the block. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see Simulink.BusElement.
Simulink uses this value to perform:

- Simulation range checking (see “Signal Ranges”)
- Automatic scaling of fixed-point data types

**Programmatic Use**

**Block Parameter:** `OutMin`  
**Type:** character vector  
**Values:** scalar  
**Default:** `'[]'`

**Maximum — Maximum value for range checking**

`[]` (default) | scalar

Specify the maximum value for the block output as a finite real double scalar value.

**Note** If you specify a bus object as the data type for this block, do not set the maximum value for bus data on the block. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value to perform:

- Simulation range checking (see “Signal Ranges”)
- Automatic scaling of fixed-point data types

**Programmatic Use**

**Block Parameter:** `OutMax`  
**Type:** character vector  
**Values:** scalar  
**Default:** `'[]'`

**Data type — Output data type**

`Inherit: auto` (default) | `double` | `single` | `int8` | `uint8` | `int16` | `uint16` | `int32` | `uint32` | `int64` | `uint64` | `boolean` | `fixdt(1,16)` | `fixdt(1,16,0)` | `fixdt(1,16,2^0,0)` | `Enum: <class name>` | `Bus: <object name>` | `<data type expression>`

Specify the desired output data type. If the data type of the input signal does not match the value you specify, the block generates an error.
Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr  
**Type:** character vector  
**Value:** 'Inherit: auto' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'boolean' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | 'Enum: <class name>' | 'Bus: <object name>' | <data type expression>  
**Default:** 'Inherit: auto'

**Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding Output data type**

**off** (default) | **on**

Select this parameter to prevent the fixed-point tools from overriding the **Output** data type you specify on the block. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

**Programmatic Use**

**Block Parameter:** LockScale  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Require nonvirtual bus — Accept only nonvirtual bus signals**

**off** (default) | **on**

If you specify a bus object as the data type, use this parameter to specify whether to accept only nonvirtual bus signals.

- **off** — Specifies that a signal must come from a **virtual** bus.
- **on** — Specifies that a signal must come from a **nonvirtual** bus.

**Dependencies**

To enable this parameter, set **Data type** to one of these values:

- **Bus:** <object name>
• `<data type expression>` that specifies a bus object

**Programmatic Use**

**Block Parameter:** BusOutputAsStruct  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'off'

**Unit (e.g., m, m/s\(^2\), N*m) — Physical unit of the input signal to the block**

Specify the physical unit of the input signal to the block. To specify a unit, begin typing in the text box. As you type, the parameter displays potential matching units. For a list of supported units, see Allowed Unit Systems.

To constrain the unit system, click the link to the right of the parameter:

• If a Unit System Configuration block exists in the component, its dialog box opens. Use that dialog box to specify allowed and disallowed unit systems for the component.

• If a Unit System Configuration block does not exist in the component, the model Configuration Parameters dialog box displays. Use that dialog box to specify allowed and disallowed unit systems for the model.

**Programmatic Use**

**Block Parameter:** Unit  
**Type:** character vector  
**Values:** 'inherit' | '<Enter unit>'  
**Default:** 'inherit'

**Dimensions (-1 for inherited) — Dimensions of input and output signals**

-1 (default) | n | [m n]

Specify the dimensions of the input and output signals.

• -1 — Specifies that signals inherit dimensions.

• n — Specifies a vector of width n.

• [m n] — Specifies a matrix with m rows and n columns.

**Programmatic Use**

**Block Parameter:** Dimensions  
**Type:** character vector
Values: '-1' | n | [m n]
Default: '-1'

Variable-size signal — Allow signal to be variable-size, fixed-size, or both
Inherit (default) | No | Yes

Specify the signal to be of variable-size, fixed size, or both.
• Inherit — Allows variable-size and fixed-size signals.
• No — Does not allow variable-size signals.
• Yes — Allows only variable-size signals.

Dependencies

When the signal is a variable-size signal, the Dimensions parameter specifies the maximum dimensions of the signal.

If you specify a bus object, the simulation allows variable-size signals only with a disabled bus object.

Programmatic Use
Block Parameter: VarSizeSig
Type: character vector
Values: 'Inherit' | 'No' | 'Yes'
Default: 'Inherit'

Sample time (-1 for inherited) — Time interval between samples
-1 (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” for more information.

Programmatic Use
Parameter: SampleTime
Type: character vector
Values: Any valid sample time
Default: '-1'

Signal type — Complexity of signal
auto (default) | real | complex

Specify the complexity of the input and output signals.
- auto — Accepts either real or complex as the numeric type.
- real — Specifies the numeric type as a real number.
- complex — Specifies the numeric type as a complex number.

**Programmatic Use**

**Parameter:** SignalType  
**Type:** character vector  
**Values:** 'auto' | 'real' | 'complex'  
**Default:** 'auto'

Unit System Configuration

**Topics**

“Unit Specification in Simulink Models”
“Variable-Size Signal Basics”
“Specify Sample Time”
Introduced before R2006a
**Simulink Function**

Function defined with Simulink blocks  
**Library:**  
Simulink / User-Defined Functions  
SimEvents

**Description**

The Simulink Function block is a Subsystem block preconfigured as a starting point for graphically defining a function with Simulink blocks. The block provides a text interface to function callers. You can call a Simulink Function block from a Function Caller block, a MATLAB Function block, or a Stateflow Chart.

For a description of the block parameters, see the Subsystem block reference page in the Simulink documentation.

You can visualize Simulink Function calls in the Sequence Viewer. The viewer shows when calls were made with the argument and the return values. See Sequence Viewer block reference.

**Function Interface**

The function interface appears on the face of a Simulink Function block. Editing the block text adds and deletes Argument Inport blocks and Argument Outport blocks from the function definition. Editing also sets the **Function name** parameter in the Trigger block within the Simulink Function block.

For example, entering \( y = \text{myfunction}(u) \) on the face of a Simulink Function block adds one Argument Inport block \( (u) \) and one Argument Outport block \( (y) \) within the subsystem.

When calling a function using a Function Caller block, the parameter **Function prototype** in the Function Caller block must match exactly the function interface you specify on the Simulink Function block. This match includes the name of the function and the names of input and output arguments. For example, the Simulink Function block and the Function Caller block both use the argument names \( u \) and \( y \).
When calling a function from a Stateflow transition or state label, you can use different argument names. For example, the Simulink Function block uses $x$ and $y$ arguments while the Stateflow transition uses $x_2$ and $y_2$ arguments to call the function.

**Function-Call Subsystems Versus Simulink Function Blocks**

In general, a Function-Call Subsystem block provides better signal traceability with direct signal connections than a Simulink Function block. While a Simulink Function block eliminates the need for routing input and output signal lines through the model hierarchy.

**In — Signal input to a subsystem block**

*scalar | vector | matrix*

Placing an Inport block in a subsystem block adds an external input port to the Simulink Function block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: *single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus | struct*

**ArgIn — Argument input to a subsystem block**

*scalar | vector | matrix*

An Argument Inport block in a subsystem block provides an input port corresponding to an input argument. A port is not displayed on the subsystem block.

Data Types: *single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus | struct*

### Output

**Out — Signal output from a subsystem**

*scalar | vector | matrix*
Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus | struct

**ArgOut — Argument output from a subsystem block**

scalar | vector | matrix

An Argument Outport block in a subsystem block provides an output port corresponding to an output argument. A port is not displayed on the subsystem block.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus | struct

**Introduced in R2014b**
Sine, Cosine

Implement fixed-point sine or cosine wave using lookup table approach that exploits quarter wave symmetry  
**Library:** Simulink / Lookup Tables

![Sine block](image)

![Cosine block](image)

**Description**

The Sine and Cosine block implements a sine and/or cosine wave in fixed point using a lookup table method that exploits quarter wave symmetry. The block can output the following functions of the input signal, depending upon what you select for the **Output formula** parameter:

- \( \sin(2\pi u) \)
- \( \cos(2\pi u) \)
- \( \exp(j2\pi u) \)
- \( \sin(2\pi u) \) and \( \cos(2\pi u) \)

You define the number of lookup table points in the **Number of data points for lookup table** parameter. The block implementation is most efficient when you specify the lookup table data points to be \((2^n)+1\), where \(n\) is an integer.

Use the **Output word length** parameter to specify the word length of the fixed-point output data type. The fraction length of the output is the output word length minus 2.
Tip To simulate a model containing this block without a Fixed-Point Designer license, you must use data type override. For more information, see “Share Fixed-Point Models”.

Ports

Input

\( u \) — Input signal to implement as fixed-point sine or cosine wave

real-valued signal

Input signal, \( u \), specified as a real-valued scalar, vector, or matrix.

Tip To obtain meaningful block output, the block input values should fall within the range \([0, 1)\). For input values that fall outside this range, the values are cast to an unsigned data type, where overflows wrap. For these out-of-range inputs, the block output might not be meaningful.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

\( \sin(2\pi u) \) — Fixed-point sine wave

real-valued fixed-point signal

Fixed-point sine wave, implemented using a lookup table approach.

Dependencies

This port is enabled when the Output formula is set to \( \sin(2\pi u) \) or \( \sin(2\pi u) \) and \( \cos(2\pi u) \).

Data Types: fixed point

\( \cos(2\pi u) \) — Fixed-point cosine wave

real-valued fixed-point signal

Fixed-point cosine wave, implemented using a lookup table approach.
Dependencies

This port is enabled when the **Output formula** is set to \( \cos(2\pi u) \) or \( \sin(2\pi u) \) and \( \cos(2\pi u) \).

Data Types: fixed point

\( \exp(j2\pi u) - \exp(j2\pi u) \)

complex-valued fixed-point signal

\( \exp(j2\pi u) \), implemented using a lookup table approach.

Dependencies

This port is enabled when the **Output formula** is set to \( \exp(j2\pi u) \).

Data Types: fixed point

Parameters

**Output formula** — Select the signal(s) to output

\( \cos(2\pi u) \) | \( \sin(2\pi u) \) | \( \exp(j2\pi u) \) | \( \sin(2\pi u) \) and \( \cos(2\pi u) \)

**Programmatic Use**

Block Parameter: Formula

Values: '\( \sin(2\pi u) \)' | '\( \cos(2\pi u) \)' | '\( \exp(j2\pi u) \)' | '\( \sin(2\pi u) \) and \( \cos(2\pi u) \)'

**Number of data points for lookup table** — Specify the number of data points to retrieve from the lookup table

(\( 2^5 \))+1 (default) | integer, greater than or equal to 2

The implementation is most efficient when you specify the lookup table data points to be \( (2^n) + 1 \), where \( n \) is an integer. To be compatible with the **Output word length** parameter, the **Number of data points for lookup table** must be less than or equal to \( (2^{(\text{Output word length}-2)}+1) \).

**Programmatic Use**

Block Parameter: NumDataPoints

Type: scalar

Value: integer >= 2

Default: '\( (2^5)+1 \)'
Output word length — Specify the word length for the fixed-point data type of the output signal
16 (default) | integer from 2 to 53

The fraction length of the output is the output word length minus 2. To be compatible with the Number of data points for lookup table parameter, \((2^{(\text{Output word length} - 2)} + 1)\) must be greater than or equal to Number of data points for lookup table.

**Note** The block uses double-precision floating-point values to construct lookup tables. Therefore, the maximum amount of precision you can achieve in your output is 53 bits. Setting the word length to values greater than 53 bits does not improve the precision of your output.

**Programmatic Use**
**Block Parameter:** OutputWordLength  
**Type:** scalar  
**Value:** integer from 2 to 53  
**Default:** '16'

**Internal rule priority for lookup table — Specify the internal rule for intermediate calculations**  
Speed (default) | Precision

Select Speed for faster calculations. If you do, a loss of accuracy might occur, usually up to 2 bits.

**Programmatic Use**
**Block Parameter:** InternalRulePriority  
**Values:** 'Speed' | 'Precision'  
**Default:** 'Speed'

**Extended Capabilities**

**C/C++ Code Generation**  
Generate C and C++ code using Simulink® Coder™.

**HDL Code Generation**  
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

**HDL Architecture**

The HDL code implements Cosine and Sine blocks by using the quarter-wave lookup table that you specify in the Simulink block parameters.

To avoid generating a division operator (/) in the HDL code, for **Number of data points for lookup table**, enter \((2^n) + 1\). \(n\) is an integer.

**HDL Block Properties**

| ConstrainedOutput Pipeline | Number of registers to place at the outputs by moving existing delays within your design. Distributed pipelining does not redistribute these registers. The default is 0. For more details, see “ConstrainedOutputPipeline” (HDL Coder). |
InputPipeline | Number of input pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “InputPipeline” (HDL Coder).

OutputPipeline | Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).

Limitations

If you use Intel MAX 10 device, to map the lookup table to RAM, add this Tcl command when creating the project in the Quartus tool:

```
set_global_assignment -name INTERNAL_FLASH_UPDATE_MODE "SINGLE IMAGE WITH ERAM"
```

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

“About Lookup Table Blocks”

Introduced before R2006a
Sine Wave

Generate sine wave, using simulation time as time source
Library: Simulink / Sources

Description

The Sine Wave block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave Function block that appears in the Math Operations library. If you select Use external signal for the Time parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

\[ y = \text{amplitude} \times \sin(\text{frequency} \times \text{time} + \text{phase}) + \text{bias}. \]

In time-based mode, the value of the Sample time parameter determines whether the block operates in continuous mode or discrete mode.

- \( \theta \) (the default) causes the block to operate in continuous mode.
- \( >\theta \) causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.

Block Behavior in Continuous Mode

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.
Block Behavior in Discrete Mode

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

\[
\sin(t + \Delta t) = \sin(t)\cos(\Delta t) + \sin(\Delta t)\cos(t)
\]

\[
\cos(t + \Delta t) = \cos(t)\cos(\Delta t) - \sin(t)\sin(\Delta t)
\]

In matrix form, these identities are:

\[
\begin{bmatrix}
\sin(t + \Delta t) \\
\cos(t + \Delta t)
\end{bmatrix} =
\begin{bmatrix}
\cos(\Delta t) & \sin(\Delta t) \\
-\sin(\Delta t) & \cos(\Delta t)
\end{bmatrix}
\begin{bmatrix}
\sin(t) \\
\cos(t)
\end{bmatrix}
\]

Because \( \Delta t \) is constant, the following expression is a constant:

\[
\begin{bmatrix}
\cos(\Delta t) & \sin(\Delta t) \\
-\sin(\Delta t) & \cos(\Delta t)
\end{bmatrix}
\]

Therefore, the problem becomes one of a matrix multiplication of the value of \( \sin(t) \) by a constant matrix to obtain \( \sin(t + \Delta t) \).

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, \((4*\text{eps})\). This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.

**Methods to Handle Round-Off Errors in Discrete Mode**

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.
## Method

<table>
<thead>
<tr>
<th>Method</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert a Saturation block directly downstream of the Sine Wave block.</td>
<td>By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.</td>
</tr>
<tr>
<td>Set up the Sine Wave block to use the ( \sin() ) math library function to calculate block output.</td>
<td>The ( \sin() ) math library function computes block output at each time step independently of output values from other time steps, preventing the accumulation of round-off errors.</td>
</tr>
<tr>
<td>1  On the Sine Wave block dialog box, set <strong>Time</strong> to <strong>Use external signal</strong> so that an input port appears on the block icon.</td>

<td></td>
</tr>
<tr>
<td>3  Set the sample time of the clock signal to the sample time of the Sine Wave block.</td>
<td></td>
</tr>
</tbody>
</table>

---

### Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

\[
y = A \sin(2\pi(k + o)/p) + b
\]

- **A** is the amplitude of the sine wave.
- **p** is the number of time samples per sine wave period.
- **k** is a repeating integer value that ranges from 0 to **p-1**.
- **o** is the offset (phase shift) of the signal.
- **b** is the signal bias.

In this mode, Simulink sets **k** equal to 0 at the first time step and computes the block output, using the formula. At the next time step, Simulink increments **k** and recomputes the output of the block. When **k** reaches **p**, Simulink resets **k** to 0 before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the
accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer \( k \) resets and the block output resets to its initial condition.

### Ports

#### Output

**Port_1 — Sine wave output signal**

*scalar | vector*

Output sine wave signal created based on the block parameter values.

**Data Types:** double

### Parameters

**Sine type — Type of sine wave**

*Time based (default) | Sample based*

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.

**Programmatic Use**

**Block Parameter:** `SineType`

**Type:** character vector

**Values:** `'Time based' | 'Sample based'`

**Default:** `'Time based'`

**Time \((t)\) — Source of time variable**

*Use simulation time (default) | Use external signal*

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source. When you select an external time source, the block is the same as the Sine Wave Function block.
Programmatic Use
Block Parameter: TimeSource
Type: character vector
Values: 'Use simulation time' | 'Use external signal'
Default: 'Use simulation time'

Amplitude — Amplitude of the sine wave
1 (default) | scalar | vector
Specify the amplitude of the output sine wave signal.

Programmatic Use
Block Parameter: Amplitude
Type: character vector
Value: scalar
Default: '1'

Bias — Constant added to sine wave
0 (default) | scalar | vector
Specify the constant value added to the sine to produce the output.

Programmatic Use
Block Parameter: Bias
Type: character vector
Value: scalar
Default: '0'

Frequency (rad/sec) — Frequency of sine wave
1 (default) | scalar | vector
Specify the frequency, in rad/sec.

Dependencies
To enable this parameter, set Sine type to Time based.

Programmatic Use
Block Parameter: Frequence
Type: character vector
Value: scalar
Default: '1'
**Phase (rad) — Phase shift of sine wave**

θ (default) | scalar | vector

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to Use simulation time. For example, if you set **Default parameter behavior** to Tunable or apply a storage class to a Simulink.Parameter object, the Phase parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to Use external signal. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see “Tune Phase Parameter of Sine Wave Block During Code Execution” (Simulink Coder).

**Dependencies**

To enable this parameter, set **Sine type** to Time based.

**Programmatic Use**

**Block Parameter:** Phase  
**Type:** character vector  
**Value:** scalar  
**Default:** '0'

**Samples per period — Samples per period**

θ (default) | integer scalar | integer vector

Specify the number of samples per period.

**Dependencies**

To enable this parameter, set **Sine type** to Sample based.

**Programmatic Use**

**Block Parameter:** Samples  
**Type:** character vector  
**Value:** scalar  
**Default:** '10'

**Number of offset samples — Offset in number of time samples**

θ (default) | integer scalar | integer vector
Specify the offset (discrete phase shift) in number of sample times.

**Dependencies**

To enable this parameter, set **Sine type** to **Sample based**.

**Programmatic Use**

**Block Parameter**: Offset
- **Type**: character vector
- **Value**: scalar
- **Default**: '0'

**Sample time — Sample period**

0 (default) | scalar | vector

Specify the sample period in seconds. The default is 0. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

**Programmatic Use**

**Block Parameter**: SampleTime
- **Type**: character vector
- **Value**: scalar
- **Default**: '0'

**Interpret vector parameters as 1-D — Output dimensions for one-row or one-column matrices**

off (default) | on

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality as the numeric parameters. See “Determining the Output Dimensions of Source Blocks” in the Simulink documentation. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

**Programmatic Use**

**Block Parameter**: VectorParams1D
- **Type**: character vector
- **Values**: 'off' | 'on'
- **Default**: 'on'

Sine Wave Function | Sine, Cosine

Introduced before R2006a
Sine Wave Function

Generate sine wave, using external signal as time source

Library: Simulink / Math Operations

Description

The Sine Wave Function block outputs a sinusoidal waveform. The block can operate in time-based or sample-based mode.

Note This block is the same as the Sine Wave block that appears in the Math Operations library. If you select Use simulation time for the Time parameter in the block dialog box, you get the Sine Wave Function block.

Time-Based Mode

The block calculates the output waveform.

\[ y = amplitude \times \sin(frequency \times time + phase) + bias. \]

In time-based mode, the value of the Sample time parameter determines whether the block operates in continuous mode or discrete mode.

- 0 (the default) causes the block to operate in continuous mode.
- >0 causes the block to operate in discrete mode.

For more information, see “Specify Sample Time”.
Block Behavior in Continuous Mode

When operating in continuous mode, the Sine Wave block can become inaccurate due to loss of precision as time becomes very large.

Block Behavior in Discrete Mode

A **Sample time** parameter value greater than zero causes the block to behave as if it were driving a Zero-Order Hold block whose sample time is set to that value.

This way, you can build models with sine wave sources that are purely discrete, rather than models that are hybrid continuous/discrete systems. Hybrid systems are inherently more complex and as a result take more time to simulate.

In discrete mode, this block uses a differential incremental algorithm instead of one based on absolute time. As a result, the block can be useful in models intended to run for an indefinite length of time, such as in vibration or fatigue testing.

The differential incremental algorithm computes the sine based on the value computed at the previous sample time. This method uses the following trigonometric identities:

\[
\begin{align*}
\sin(t + \Delta t) &= \sin(t) \cos(\Delta t) + \sin(\Delta t) \cos(t) \\
\cos(t + \Delta t) &= \cos(t) \cos(\Delta t) - \sin(t) \sin(\Delta t)
\end{align*}
\]

In matrix form, these identities are:

\[
\begin{bmatrix}
\sin(t + \Delta t) \\
\cos(t + \Delta t)
\end{bmatrix} = 
\begin{bmatrix}
\cos(\Delta t) & \sin(\Delta t) \\
-\sin(\Delta t) & \cos(\Delta t)
\end{bmatrix} 
\begin{bmatrix}
\sin(t) \\
\cos(t)
\end{bmatrix}
\]

Because \(\Delta t\) is constant, the following expression is a constant:

\[
\begin{bmatrix}
\cos(\Delta t) & \sin(\Delta t) \\
-\sin(\Delta t) & \cos(\Delta t)
\end{bmatrix}
\]

Therefore, the problem becomes one of a matrix multiplication of the value of \(\sin(t)\) by a constant matrix to obtain \(\sin(t + \Delta t)\).

Discrete mode reduces but does not eliminate the accumulation of round-off errors, for example, \((4*\text{eps})\). This accumulation can happen because computation of the block output at each time step depends on the value of the output at the previous time step.
Methods to Handle Round-Off Errors in Discrete Mode

To handle round-off errors when the Sine Wave block operates in time-based discrete mode, use one of these methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert a Saturation block directly downstream of the Sine Wave block.</td>
<td>By setting saturation limits on the Sine Wave block output, you can remove overshoot due to accumulation of round-off errors.</td>
</tr>
<tr>
<td>Set up the Sine Wave block to use the sin() math library function to calculate block output.</td>
<td>The sin() math library function computes block output at each time step independently of output values from other time steps, preventing the accumulation of round-off errors.</td>
</tr>
</tbody>
</table>

1. On the Sine Wave block dialog box, set **Time** to **Use external signal** so that an input port appears on the block icon.
2. Connect a clock signal to this input port using a Digital Clock block.
3. Set the sample time of the clock signal to the sample time of the Sine Wave block.

Sample-Based Mode

Sample-based mode uses this formula to compute the output of the Sine Wave block.

\[ y = A \sin(2\pi(k + o)/p) + b \]

- \( A \) is the amplitude of the sine wave.
- \( p \) is the number of time samples per sine wave period.
- \( k \) is a repeating integer value that ranges from 0 to \( p-1 \).
- \( o \) is the offset (phase shift) of the signal.
- \( b \) is the signal bias.

In this mode, Simulink sets \( k \) equal to \( 0 \) at the first time step and computes the block output, using the formula. At the next time step, Simulink increments \( k \) and recomputes
the output of the block. When \( k \) reaches \( p \), Simulink resets \( k \) to 0 before computing the block output. This process continues until the end of the simulation.

The sample-based method of computing block output at a given time step does not depend on the output of the previous time steps. Therefore, this mode avoids the accumulation of round-off errors. Sample-based mode supports reset semantics in subsystems that offer it. For example, if a Sine Wave block is in a resettable subsystem that receives a reset trigger, the repeating integer \( k \) resets and the block output resets to its initial condition.

**Ports**

**Input**

**Port_1 — Time source signal**
scalar

Input signal representing the time source in the sine wave calculation.
Data Types: double

**Output**

**Output 1 — Output sine wave signal**
scalar

Output signal that is the created sine wave.
Data Types: double

**Parameters**

**Sine type — Type of sine wave**
Time based (default) | Sample based

Specify the type of sine wave that this block generates. Some parameters in the dialog box appear depending on whether you select time-based or sample-based.
**Programmatic Use**
**Block Parameter:** SineType
**Type:** character vector
**Values:** 'Time based' | 'Sample based'
**Default:** 'Time based'

**Time (t) — Source of time variable**
*Use external signal (default) | Use simulation time*

Specify whether to use simulation time as the source of values for the time variable, or an external source. If you specify an external time source, the block creates an input port for the time source.

**Programmatic Use**
**Block Parameter:** TimeSource
**Type:** character vector
**Values:** 'Use simulation time' | 'Use external signal'
**Default:** 'Use external signal'

**Amplitude — Amplitude of the sine wave**
1 (default) | scalar

Specify the amplitude of the output sine wave signal.

**Programmatic Use**
**Block Parameter:** Amplitude
**Type:** character vector
**Value:** scalar
**Default:** '1'

**Bias — Constant added to sine wave**
0 (default) | scalar

Specify the constant value added to the sine to produce the output.

**Programmatic Use**
**Block Parameter:** Bias
**Type:** character vector
**Value:** scalar
**Default:** '0'

**Frequency (rad/sec) — Frequency of sine wave**
1 (default) | scalar
Specify the frequency, in radians per second.

**Dependency**

To enable this parameter, set **Sine type** to **Time based**.

**Programmatic Use**

**Block Parameter:** Frequency  
**Type:** character vector  
**Value:** scalar  
**Default:** '1'

**Phase (rad) — Phase shift of sine wave**  
0 (default) | scalar

Specify the phase shift of the sine wave.

You cannot configure this parameter to appear in the generated code as a tunable global variable if you set **Time (t)** to **Use simulation time**. For example, if you set **Default parameter behavior** to **Tunable** or apply a storage class to a Simulink.Parameter object, the **Phase** parameter does not appear in the generated code as a tunable global variable.

To generate code so that you can tune the phase during execution, set **Time (t)** to **Use external signal**. You can provide your own time input signal or use a Digital Clock block to generate the time signal. For an example, see “Tune Phase Parameter of Sine Wave Block During Code Execution” (Simulink Coder).

**Dependencies**

To enable this parameter, set **Sine type** to **Time based**.

**Programmatic Use**

**Block Parameter:** Phase  
**Type:** character vector  
**Value:** scalar  
**Default:** '0'

**Samples per period — Samples per period**  
0 (default) | integer

Specify the number of samples per period.
**Dependencies**

To enable this parameter, set **Sine type** to **Sample based**.

**Programmatic Use**

**Block Parameter**: Samples  
**Type**: character vector  
**Value**: scalar  
**Default**: '10'

**Number of offset samples** — **Offset in number of time samples**

0 (default) | integer

Specify the offset (discrete phase shift) in number of sample times.

**Dependencies**

To enable this parameter, set **Sine type** to **Sample based**.

**Programmatic Use**

**Block Parameter**: Offset  
**Type**: character vector  
**Value**: scalar  
**Default**: '0'

**Sample time** — **Sample period**

0 (default) | scalar

Specify the sample period in seconds. The default is 0. If the sine type is sample-based, the sample time must be greater than 0. See “Specify Sample Time”.

**Programmatic Use**

**Block Parameter**: SampleTime  
**Type**: character vector  
**Value**: scalar  
**Default**: '0'

**Interpret vector parameters as 1-D** — **Output dimensions for one-row or one-column matrices**

off (default) | on

Specify the output dimensions to be a 1-D vector signal when other parameters are one-row and one-column matrices. If you do not select this box, the block outputs a signal of the same dimensionality as the numeric parameters. See “Determining the Output
Dimensions of Source Blocks” in the Simulink documentation. This parameter is not available when an external signal specifies time. In this case, if numeric parameters are column or row matrix values, the output is a 1-D vector.

**Programmatic Use**

**Block Parameter:** VectorParams1D  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'on'

Slider

Tune parameter value with sliding scale

Library: Simulink / Dashboard

Description

The Slider block tunes the value of the connected block parameter during simulation. For example, you can connect the Slider block to a Gain block in your model and adjust its value during simulation. You can modify the range of the Slider block's scale to fit your data. Use the Slider block with other Dashboard blocks to create an interactive dashboard to control your model.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using Ctrl+D.

To enter connect mode, click the Connect button that appears above your unconnected Dashboard block when you pause on it.
In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

**Parameter Logging**

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`.

1-1901
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the **Connection** table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the **Connection** table. For example, a block parameter defined as `engine(1)` using the variable `engine` does not appear in the table.

To access the parameter in the **Connection** table, assign the indexed value to a scalar variable, such as `engine_1`. Then, use the scalar variable to define the block parameter.

- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the **Default parameter behavior** set to **Inlined**, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its **Gain** parameter using the Dashboard blocks, but the **Gain** value used in the simulation does not change.

Parameters

**Connection** — Select a variable or block parameter to connect
variable and parameter connection options

Select the variable or block parameter to control using the **Connection** table. Populate the **Connection** table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click **Apply**. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

**Programmatic Use**

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** Binding  
**Type:** `Simulink.HMI.ParamSourceInfo`  
**Default:** `[]`  

**Scale Type — Type of scale**

**Linear** (default) | **Log**

Type of scale displayed on the control. **Linear** specifies a linear scale, and **Log** specifies a logarithmic scale.

**Programmatic Use**

**Block Parameter:** `ScaleType`  
**Type:** string or character vector  
**Values:** 'Linear' | 'Log'  
**Default:** 'Linear'

**Minimum — Minimum tick mark value**

0 (default) | scalar

Finite, real, double, scalar value specifying the minimum tick mark value for the arc. The minimum must be less than the value entered for the maximum.

**Programmatic Use**

To programmatically set the `Minimum` parameter, use a 1-by-3 vector containing values for the `Minimum`, `Tick Interval`, and `Maximum` parameters, in that order. To use the
auto value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

**Block Parameter:** Limits
**Type:** 1x3 vector
**Default:** [0 -1 100]

**Maximum — Maximum tick mark value**
100 (default) | scalar

Finite, real, double, scalar value specifying the maximum tick mark value for the arc. The maximum must be greater than the value entered for the minimum.

**Programmatic Use**

To programmatically set the Maximum parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the auto value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

**Block Parameter:** Limits
**Type:** 1x3 vector
**Default:** [0 -1 100]

**Tick Interval — Interval between major tick marks**

auto (default) | scalar

Finite, real, positive, integer, scalar value specifying the interval of major tick marks on the arc. When set to auto, the block automatically adjusts the tick interval based on the minimum and maximum values.

**Programmatic Use**

To programmatically set the Tick Interval parameter, use a 1-by-3 vector containing values for the Minimum, Tick Interval, and Maximum parameters, in that order. To use the auto value for the Tick Interval, leave the Tick Interval position in the vector empty or specify -1.

**Block Parameter:** Limits
**Type:** 1x3 vector
**Default:** [0 -1 100]

**Label — Block label position**
Top (default) | Bottom | Hide
Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

**Programmatic Use**

**Block Parameter:** LabelPosition  
**Type:** character vector  
**Values:** 'Top' | 'Bottom' | 'Hide'  
**Default:** 'Top'

Slider Gain

Vary scalar gain using slider

Library: Simulink / Math Operations

Description

The Slider Gain block performs a scalar gain that you can modify during simulation. Modify the gain using the slider parameter.

Ports

Input

Port_1 — Input signal
scalar | vector | matrix

The Slider Gain block accepts real or complex-valued scalar, vector, or matrix input. The block supports fixed-point data types.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

Port_1 — Input multiplied by gain
scalar | vector | matrix

The Slider Gain block outputs the input multiplied by a constant gain value. When the input to the block is real and gain is complex, the output is complex.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Parameters

Slider gain — Gain value
0 (default) | real value

Chose the gain value applied to the input.

Programmatic Use
Block Parameter: gain
Type: character vector
Values: real scalar
Default: '1'

Low — Lower limit of slider range
0 (default) | real value

Specify the lower limit of the slider range.

Programmatic Use
Block Parameter: low
Type: character vector
Values: real scalar
Default: '0'

High — Upper limit of slider range
2 (default) | real value

Specify the upper limit of the slider range.

Programmatic Use
Block Parameter: high
Type: character vector
Values: real scalar
Default: '2'

Introduced before R2006a
Spectrum Analyzer

Display frequency spectrum

**Library:**
- DSP System Toolbox / Sinks
- DSP System Toolbox HDL Support / Sinks

**Description**

The Spectrum Analyzer block, referred to here as the scope, displays the frequency spectra of signals.
You can use the Spectrum Analyzer block in models running in Normal or Accelerator simulation modes. You can also use the Spectrum Analyzer block in models running in Rapid Accelerator or External simulation modes, with some limitations.

You can use the Spectrum Analyzer block inside all subsystems and conditional subsystems. Conditional subsystems include enabled subsystems, triggered subsystems, enabled and triggered subsystems, and function-call subsystems. See “Conditionally Executed Subsystems Overview” for more information.

**Measurements**

- **Cursors (DSP System Toolbox)** — Measure signal values using vertical and horizontal cursors.
- **Peak Finder (DSP System Toolbox)** — Find maxima, showing the x-axis values at which they occur.
- **Channel Measurements (DSP System Toolbox)** — Measure the occupied bandwidth or adjacent channel power ratio (ACPR).
- **Distortion Measurements (DSP System Toolbox)** — Measure harmonic distortion and intermodulation distortion.
- **CCDF Measurements (DSP System Toolbox)** — Measure the complimentary cumulative distribution function. CCDF measurements show the probability of a signal’s instantaneous power being a specified level above the signal’s average power.
- **“Spectral Masks” (DSP System Toolbox)** — Visualize spectrum limits and compare spectrum values to specification values.

**Programmatic Control**

You can configure and display Spectrum Analyzer settings from the command line with the `spbscopes.SpectrumAnalyzerConfiguration` object.

**Ports**

**Input**

**Port_1 — Signals to visualize**

scalar | vector | matrix | array
Connect the signals you want to visualize. You can have up to 96 input ports. Input signals can have these characteristics:

- **Signal Domain** — Frequency or time signals
- **Type** — Discrete (sample-based and frame-based).
- **Data type** — Any data type that Simulink supports. See “Data Types Supported by Simulink”.
- **Dimension** — One dimensional (vector), two dimensional (matrix), or multidimensional (array). Input must have fixed number of channels. See “Signal Dimensions” and “Determine Output Signal Dimensions”.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

## Parameters

### Spectrum Settings

The **Spectrum Settings** pane appears at the right side of the Spectrum Analyzer window. These settings control how the spectrum is calculated. To show the Spectrum Settings, in the Spectrum Analyzer menu, select **View > Spectrum Settings** or use the button in the toolbar.

**Main options**

**Input domain — Domain of the input signal**

**Time** (default) | **Frequency**

The domain of the input signal you want to visualize. If you visualize time-domain signals, the signal is transformed to the frequency spectrum based on the algorithm specified by the **Method** parameter.

**Programmatic Use**

See **InputDomain**.

**Type — Type of spectrum to display**

**Power** (default) | **Power density** | **RMS**
Power — Spectrum Analyzer shows the power spectrum.

Power density — Spectrum Analyzer shows the power spectral density. The power spectral density is the magnitude of the spectrum normalized to a bandwidth of 1 hertz.

RMS — Spectrum Analyzer shows the root mean squared spectrum.

Tunable: Yes

Programmatic Use

See .

View — Spectrum view
Spectrum (default) | Spectrogram | Spectrum and spectrogram

Spectrum — Spectrum Analyzer shows the spectrum.

Spectrogram — Spectrum Analyzer shows the spectrogram, which displays frequency content over time. The most recent spectrogram update is at the bottom of the display, and time scrolls from the bottom to the top of the display.

Spectrum and spectrogram — Spectrum Analyzer shows both the spectrum and spectrogram.

Tunable: Yes

Programmatic Use

See ViewType.

Sample rate — Sample rate of the input signal in hertz
Inherited (default) | positive scalar

Select Inherited to use the same sample rate as the input signal. To specify a sample rate, delete Inherited and enter a sample rate value.

Programmatic Use

See SampleRate.

Method — Spectrum estimation method
Welch (default) | Filter Bank
Select Welch or Filter Bank as the spectrum estimation method. For more details about the two spectrum estimation algorithms, see “Algorithms” (DSP System Toolbox).

**Tunable:** No

**Dependency**

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

**Programmatic Use**

See `Method`.

**Full frequency span — Use entire Nyquist frequency interval**

`on (default) | off`

Select this check box to compute and plot the spectrum over the entire “Nyquist frequency interval” (DSP System Toolbox).

**Tunable:** Yes

**Dependency**

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

**Programmatic Use**

See `FrequencySpan`.

**Span (Hz) — Frequency span in hertz**

`10e3 (default) | real positive scalar`

Specify the frequency span in hertz. Use this parameter with the CF (Hz) parameter to define the frequency span around a center frequency. This parameter defines the range of values shown on the Frequency axis in the Spectrum Analyzer window.

**Tunable:** Yes

**Dependencies**

To use this parameter, you must:

- Set “Input domain” (DSP System Toolbox) to Time.
- Clear the “Full frequency span” (DSP System Toolbox) check box.
• Set the **Span (Hz)/Fstart (Hz)** dropdown to **Span (Hz)**.

**Programmatic Use**

See FrequencySpan and Span.

**CF (Hz) — Center frequency in hertz**

0 (default) | scalar

Specify the center frequency, in hertz. Use this parameter with the “Span (Hz)” (DSP System Toolbox) parameter to define the frequency span around a center frequency. This parameter defines the value shown at the middle point of the Frequency axis on the Spectrum Analyzer window.

**Tunable**: Yes

**Dependencies**

To use this parameter, you must:

• Set “Input domain” (DSP System Toolbox) to **Time**.
• Clear the “Full frequency span” (DSP System Toolbox) check box.
• Set the **Span (Hz)/Fstart (Hz)** dropdown to “Span (Hz)” (DSP System Toolbox).

**Programmatic Use**

See CenterFrequency.

**FStart (Hz) — Start frequency in hertz**

-5e3 (default) | scalar

Specify the start frequency in hertz. Use this parameter with the “FStop (Hz)” (DSP System Toolbox) parameter to define the range of frequency-axis values using start frequency and stop frequency. This parameter defines the value shown at the leftmost side of the Frequency axis on the Spectrum Analyzer window.

**Tunable**: Yes

**Dependencies**

To use this parameter, you must:

• Set “Input domain” (DSP System Toolbox) to **Time**.
• Clear the “Full frequency span” (DSP System Toolbox) check box.
• Set the Span (Hz)/FStart (Hz) dropdown to FStart (Hz).

**Programmatic Use**

See StartFrequency.

**FStop (Hz) — Stop frequency in hertz**

5e3 (default) | scalar

Specify the stop frequency, in hertz. Use this parameter with the “FStart (Hz)” (DSP System Toolbox) parameter to define the range of Frequency axis values. This parameter defines the value shown at the rightmost side of the Frequency axis on the Spectrum Analyzer window.

**Tunable:** Yes

**Dependencies**

To use this parameter, you must:

• Set “Input domain” (DSP System Toolbox) to Time.
• Clear the “Full frequency span” (DSP System Toolbox) check box.
• Set the Span (Hz)/FStart (Hz) dropdown to “FStart (Hz)” (DSP System Toolbox).

**Programmatic Use**

See StopFrequency.

**Frequency (Hz) — Frequency vector**

Auto (default) | Input port | monotonically increasing vector

Set the frequency vector which determines the x-axis of the display.

• Auto — The frequency vector is calculated from the length of the input. See “Frequency Vector” (DSP System Toolbox).
• Input port — When selected, an input port appears on the block for the frequency vector input.
• Custom vector — Enter a custom vector as the frequency vector. The length of the custom vector must be equal to the frame size of the input signal.

**Tunable:** No
Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Frequency.

Programmatic Use

See FrequencyVector.

RBW (Hz) — Resolution bandwidth
Auto (default) | Input port | positive scalar

The resolution bandwidth in hertz. This parameter defines the smallest positive frequency that can be resolved. By default, this parameter is set to Auto. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span.

If you set this parameter to a numeric value, the value must allow at least two RBW intervals over the specified frequency span. In other words, the ratio of the overall frequency span to RBW must be greater than two:

\[
\frac{\text{span}}{\text{RBW}} > 2
\]

For frequency input only, you can use an input port to set the RBW value.

Tunable: Yes

Dependency

To use this parameter, set either:

- “Input domain” (DSP System Toolbox) to Time and the RBW (Hz)/Window length/Number of frequency bands dropdown to RBW (Hz).
- “Input domain” (DSP System Toolbox) to Frequency.

Programmatic Use

See RBW.

Input units — Units of frequency input
Auto (default) | dBm | dBV | dBW | Vrms | Watts
Select the units of the frequency-domain input. This property allows the Spectrum Analyzer to scale frequency data if you choose a different display unit with the “Units” (DSP System Toolbox) property.

**Tunable:** No

**Dependency**

This option is only available when “Input domain” (DSP System Toolbox) is set to Frequency.

**Programmatic Use**

See InputUnits.

**Window length — Length of window in samples**

1024 (default) | integer greater than 2

The length of the window, in samples. The window length used to control the frequency resolution and compute the spectral estimates. The window length must be an integer greater than 2.

**Dependencies**

To use this parameter, set:

- “Method” (DSP System Toolbox) to Welch
- Set the RBW (Hz)/Window length/Number of frequency bands dropdown to Window Length

**Dependency**

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

**Programmatic Use**

See WindowLength.

**Number of frequency bands — FFT length**

Auto (default) | positive integer

Specify the fast Fourier transform (FFT) length to control the number of frequency bands. If the value is Auto, the Spectrum Analyzer uses the entire frame size to estimate the spectrum. If you specify the number of frequency bands, you set the input buffer size.
Dependencies

To use this parameter, set:

• “Method” (DSP System Toolbox) to Filter Bank
• Set the RBW (Hz)/Window length/Number of frequency bands dropdown to Number of frequency bands

Programmatic Use

See FFTLength

Taps per band — Number of filter taps

12 (default) | positive even integer

Specify the number of filter taps or coefficients for each frequency band. This number must be a positive even integer. This value corresponds to the number of filter coefficients per polyphase branch. The total number of filter coefficients is equal to Taps Per Band + FFT Length.

Dependency

To use this parameter, you must set the RBW (Hz)/Window length/Number of frequency bands dropdown to “Number of frequency bands” (DSP System Toolbox).

Programmatic Use

See NumTapsPerBand.

NFFT — Number of FFT points

Auto (default) | positive integer

Specify the length of the FFT that Spectrum Analyzer uses to compute spectral estimates. Acceptable options are Auto or a positive integer.

The NFFT value must be greater than or equal to the value of the Window length parameter. By default, when NFFT is set to Auto, the Spectrum Analyzer sets NFFT equal to the value of Window length. When in RBW mode, the specified RBW value is used to calculate an FFT length that equals the window length.

When this parameter is set to a positive integer, this parameter is equivalent to the n parameter of the fft function.
Dependencies

To use this parameter, you must set the **RBW (Hz)/Window length/Number of frequency bands** dropdown to “Window length” (DSP System Toolbox).

**Programmatic Use**

See FFTLength.

**Samples/update — Required number of input samples**

This property is read-only.

The number of input samples required to compute one spectral update. You cannot modify this parameter; it is shown in the spectrum analyzer for informational purposes only. This parameter is directly related to **RBW (Hz)/Window length/Number of frequency bands**. For more details, see “Algorithms” (DSP System Toolbox).

If the input does not have enough samples to achieve the resolution bandwidth that you specify, Spectrum Analyzer produces a message on the display.

---

**Spectrogram Settings**

**Channel — Spectrogram channel**

Select the signal channel for which the spectrogram settings apply.

**Dependencies**

To use this option, set “View” (DSP System Toolbox) to **Spectrogram** or **Spectrum** and **spectrogram**.

**Programmatic Use**

See SpectrogramChannel.
**Time res. (s) — Time resolution in seconds**
Auto (default) | positive number

Time resolution is the amount of data, in seconds, used to compute a spectrogram line. The minimum attainable resolution is the amount of time it takes to compute a single spectral estimate. The tooltip displays the minimum attainable resolution given the current settings.

The time resolution value is determined based on frequency resolution method, the RBW setting, and the time resolution setting.

</tr>
</tbody>
</table>

**Tunable:** Yes

**Dependency**

To use this option, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

**Programmatic Use**

See TimeResolution.

**Time span — Time span in seconds**

Auto (default) | positive scalar
The time span over which the Spectrum Analyzer displays the spectrogram specified in seconds. The time span is the product of the desired number of spectral lines and the time resolution. The tooltip displays the minimum allowable time span, given the current settings. If the time span is set to Auto, 100 spectral lines are used.

**Tunable:** Yes

**Dependency**

To use this option, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

**Programmatic Use**

See TimeSpan.

**Window Options**

**Overlap (%) — Segment overlap percentage**

0 (default) | scalar between 0 and 100

This parameter defines the amount of overlap between the previous and current buffered data segments. The overlap creates a window segment that is used to compute a spectral estimate. The value must be greater than or equal to zero and less than 100.

**Tunable:** Yes

**Programmatic Use**

See OverlapPercent.

**Window — Windowing method**

Hann (default) | Rectangular | Blackman-Harris | Chebyshev | Flat Top | Hamming | Kaiser | custom window function name

The windowing method to apply to the spectrum. Windowing is used to control the effect of sidelobes in spectral estimation. The window you specify affects the window length required to achieve a resolution bandwidth and the required number of samples per update. For more information about windowing, see “Windows” (Signal Processing Toolbox).

**Tunable:** Yes
**Programmatic Use**

See `Window`.

**Attenuation — Sidelobe attenuation**

60 (default) | scalar greater than or equal to 45

The sidelobe attenuation in decibels (dB). The value must be greater than or equal to 45.

**Dependency**

This parameter applies only when you set the `Window` parameter to Chebyshev or Kaiser.

**Programmatic Use**

See `SidelobeAttenuation`.

**NENBW — Normalized effective noise bandwidth**

scalar

This property is read-only.

The normalized effective noise bandwidth of the window. You cannot modify this parameter; it is shown for informational purposes only. This parameter is a measure of the noise performance of the window. The value is the width of a rectangular filter that accumulates the same noise power with the same peak power gain.

The rectangular window has the smallest NENBW, with a value of 1. All other windows have a larger NENBW value. For example, the Hann window has an NENBW value of approximately 1.5.

**Trace Options**

**Units — Spectrum units**

dBm (default) | dBW | Watts | Vrms | dBV | dBFS

The units of the spectrum. The available values depend on the value of the “Type” (DSP System Toolbox) parameter.

**Tunable:** Yes

**Programmatic Use**

See `SpectrumUnits`.  

1-1924
**Full scale — Full scale for dBFS units**
Auto (default) | positive real scalar

The full scale used for the decibel full scale (dBFS) units. By default, the Spectrum Analyzer uses the entire spectrum scale. Specify a positive real scalar for the dBFS full scale.

**Tunable:** Yes

**Dependencies**

To enable this parameter, set:

- “Input domain” (DSP System Toolbox) to Time
- “Units” on page 1-0 to dBFS

**Programmatic Use**

See FullScale.

**Averaging method — Smoothing method**
Running (default) | Exponential

Specify the smoothing method as:

- **Running** — Running average of the last \( n \) samples. Use the Averages property to specify \( n \).
- **Exponential** — Weighted average of samples. Use the Forgetting factor property to specify the weighted forgetting factor.

For more information about the averaging methods, see “Averaging Method” on page 1-1946.

**Programmatic Use**

See AveragingMethod.

**Averages — Number of spectral averages**
1 (default) | positive integer

Specify the number of spectral averages as a positive integer. The spectrum analyzer computes the current power spectrum estimate by computing a running average of the last \( N \) power spectrum estimates. This parameter defines the number of spectral averages, \( N \).
Dependencies

This parameter applies only when:

• “View” (DSP System Toolbox) is Spectrum or Spectrum and spectrogram.
• Averaging method is Running.

Programmatic Use

See SpectralAverages.

Forgetting factor — Weighting forgetting factor

0.9 (default) | scalar in the range (0,1]

Specify the exponential weighting as a scalar value greater than 0 and less than or equal to 1.

Dependency

This parameter applies only when the Averaging method is Exponential.

Programmatic Use

See ForgettingFactor.

Reference load — Reference load

1 (default) | positive real scalar

The reference load in ohms that the Spectrum Analyzer uses as a reference to compute power values.

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See ReferenceLoad.

Scale — Scale of frequency axis

Linear (default) | Logarithmic

Choose a linear or logarithm scale for the frequency axis. When the frequency span contains negative frequency values, you cannot choose the logarithmic option.
Programmatic Use

See FrequencyScale.

Offset — Constant frequency offset

\[ 0 \text{ (default)} | \text{scalar} \]

The constant frequency offset to apply to the entire spectrum, or a vector of frequencies to apply to each spectrum for multiple inputs. The offset parameter is added to the values on the Frequency axis in the Spectrum Analyzer window. This parameter is not used in any spectral computations. You must take the parameter into consideration when you set the Span (Hz) and CF (Hz) parameters to ensure that the frequency span is within the “Nyquist frequency interval” (DSP System Toolbox).

Dependency

To use this parameter, set “Input domain” (DSP System Toolbox) to Time.

Programmatic Use

See FrequencyOffset.

Normal trace — Normal trace view

\[ \text{on (default)} | \text{off} \]

When this check box is selected, the Spectrum Analyzer calculates and plots the power spectrum or power spectrum density. Spectrum Analyzer performs a smoothing operation by averaging several spectral estimates.

Dependencies

To clear this check box, you must first select either the “Max hold trace” (DSP System Toolbox) or the “Min hold trace” (DSP System Toolbox) parameter. This parameter applies only when “View” (DSP System Toolbox) is Spectrum or Spectrum and spectrogram.

Programmatic Use

See PlotNormalTrace.

Max hold trace — Maximum hold trace view

\[ \text{off (default)} | \text{on} \]

Select this check box to enable Spectrum Analyzer to plot the maximum spectral values of all the estimates obtained.
Dependency

This parameter applies only when “View” (DSP System Toolbox) is Spectrum or Spectrum and spectrogram.

Programmatic Use

See PlotMaxHoldTrace.

Min hold trace — Minimum hold trace view

off (default) | on

Select this check box to enable Spectrum Analyzer to plot the minimum spectral values of all the estimates obtained.

Dependency

This parameter applies only when “View” (DSP System Toolbox) is Spectrum or Spectrum and spectrogram.

Programmatic Use

See PlotMinHoldTrace.

Two-sided spectrum — Enable two-sided spectrum view

off (default) | on

Select this check box to enable a two-sided spectrum view. In this view, both negative and positive frequencies are shown. If you clear this check box, Spectrum Analyzer shows a one-sided spectrum with only positive frequencies. Spectrum Analyzer requires that this parameter is selected when the input signal is complex-valued.

Programmatic Use

See PlotAsTwoSidedSpectrum.

Configuration Properties

The Configuration Properties dialog box controls visual aspects of the Spectrum Analyzer. To open the Configuration Properties, in the Spectrum Analyzer menu, select View > Configuration Properties or select the button in the toolbar dropdown.
**Title — Display title**
character vector | string

Specify the display title. Enter `%<SignalLabel>` to use the signal labels in the Simulink model as the axes titles.

**Tunable:** Yes

**Programmatic Use**

See **Title**.

**Show legend — Display signal legend**
off (default) | on

Show signal legend. The names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. Continuous signals have straight lines before their names and discrete signals have step-shaped lines.

From the legend, you can control which signals are visible. This control is equivalent to changing the visibility in the **Style** parameters. In the scope legend, click a signal name to hide the signal in the scope. To show the signal, click the signal name again. To show only one signal, right-click the signal name, which hides all other signals. To show all signals, press **ESC**.

**Note** The legend only shows the first 20 signals. Any additional signals cannot be viewed or controlled from the legend.

**Dependency**

To enable this parameter, set “View” (DSP System Toolbox) to **Spectrum** or **Spectrum** and **spectrogram**.

**Programmatic Use**

See **ShowLegend**.

**Show grid — Show internal grid lines**
on (default) | off

Show internal grid lines on the Spectrum Analyzer
Programmatic Use

See ShowGrid.

**Y-limits (minimum) — Y-axis minimum**

-80 (default) | scalar

Specify the minimum value of the y-axis.

Programmatic Use

See YLimits.

**Y-limits (maximum) — Y-axis maximum**

20 (default) | scalar

Specify the maximum value of the y-axis.

Programmatic Use

See YLimits.

**Y-label — Y-axis label**

character vector | string

To display signal units, add (%<SignalUnits>) to the label. At the beginning of a simulation, Simulink replaces (%SignalUnits) with the units associated with the signals. For example, if you have a signal for velocity with units of m/s enter

Velocity (%<SignalUnits>)

Programmatic Use

See YLabel.

**Color map — Spectrogram colormap**

jet(256) (default) | hot(256) | bone(256) | cool(256) | copper(256) | gray(256) | parula(256) | 3-column matrix

Select the colormap for the spectrogram, or enter a three-column matrix expression for the colormap. For more information about colormaps, see colormap.

**Tunable:** Yes
Dependency

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Color-limits (minimum) — Spectrogram minimum

-80 (default) | scalar

Specify the signal power for the minimum color value of the spectrogram.

Tunable: Yes

Dependency

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See ColorLimits.

Color-limits (maximum) — Spectrogram maximum

20 (default) | scalar

Specify the signal power for the maximum color value of the spectrogram.

Tunable: Yes

Dependency

To use this parameter, set “View” (DSP System Toolbox) to Spectrogram or Spectrum and spectrogram.

Programmatic Use

See ColorLimits.

Style

The Style dialog box controls how to Spectrum Analyzer appears. To open the Style properties, in the Spectrum Analyzer menu, select View > Style or select the button in the toolbar dropdown.
**Figure color — Window background**  
gray (default) | color picker

Specify the color that you want to apply to the background of the scope figure.

**Plot type — Plot type**  
Line (default) | Stem

Specify whether to display a Line or Stem plot.

**Programmatic Use**

See `PlotType`.

**Axes colors — Axes background color**  
black (default) | color picker

Specify the color that you want to apply to the background of the axes.

**Properties for line — Channel for visual property settings**  
channel names

Specify the channel for which you want to modify the visibility, line properties, and marker properties.

**Visible — Channel visibility**  
on (default) | off

Specify whether the selected channel is visible. If you clear this check box, the line disappears. You can also change signal visibility using the scope legend.

**Line — Line style**  
line, 0.5, yellow (default)

Specify the line style, line width, and line color for the selected channel.

**Marker — Data point markers**  
none (default)

Specify marks for the selected channel to show at its data points. This parameter is similar to the 'Marker' property for plots. You can choose any of the marker symbols from the dropdown.
Axes Scaling

The Axes Scaling dialog box controls the axes limits of the Spectrum Analyzer. To open the Axes Scaling properties, in the Spectrum Analyzer menu, select Tools > Axes Scaling > Axes Scaling Properties.

Axes scaling/Color scaling — Automatic axes scaling
Auto (default) | Manual | After N Updates

Specify when the scope automatically scales the y-axis. If the spectrogram is displayed, specify when the scope automatically scales the color axis. By default, this parameter is set to Auto, and the scope does not shrink the y-axis limits when scaling the axes or color. You can select one of the following options:

• Auto — The scope scales the axes or color as needed, both during and after simulation. Selecting this option shows the Do not allow Y-axis limits to shrink or Do not allow color limits to shrink.
• Manual — When you select this option, the scope does not automatically scale the axes or color. You can manually scale the axes or color in any of the following ways:
  • Select Tools > Scaling Properties.
  • Press one of the Scale Axis Limits toolbar buttons.
  • When the scope figure is the active window, press Ctrl+A.
• After N Updates — Selecting this option causes the scope to scale the axes or color after a specified number of updates. This option is useful, and most efficient, when your frequency signal values quickly reach steady-state after a short period. Selecting this option shows the Number of updates edit box where you can modify the number of updates to wait before scaling.

Tunable: Yes

Programmatic Use

See AxesScaling.

Do not allow Y-axis/color limits to shrink — Axes scaling limits
on (default) | off

When you select this parameter, the y-axis is allowed to grow during axes scaling operations. If the spectrogram is displayed, selecting this parameter allows the color
limits to grow during axis scaling. If you clear this check box, the y-axis or color limits can shrink during axes scaling operations.

**Dependency**

This parameter appears only when you select Auto for the **Axis scaling** or **Color scaling** parameter. When you set the **Axes scaling** or **Color scaling** parameter to Manual or After N Updates, the y-axis or color limits can shrink.

**Number of updates — Number of updates before scaling**

10 (default) | positive number

The number of updates after which the axes scale, specified as a positive integer. If the spectrogram is displayed, this parameter specifies the number of updates after which the color axes scales.

**Tunable:** Yes

**Dependency**

This parameter appears only when you set “Axes scaling/Color scaling” (DSP System Toolbox) to After N Updates.

**Programmatic Use**

See AxesScalingNumUpdates.

**Scale limits at stop — Scale axes at stop**

off (default) | on

Select this check box to scale the axes when the simulation stops. If the spectrogram is displayed, select this check box to scale the color when the simulation stops. The y-axis is always scaled. The x-axis limits are only scaled if you also select the **Scale X-axis limits** check box.

**Data range (%) — Percent of axes**

100 (default) | number in the range [1,100]

Set the percentage of the axis that the scope uses to display the data when scaling the axes. If the spectrogram is displayed, set the percentage of the power values range within the colormap. Valid values are from 1 through 100. For example, if you set this parameter to 100, the scope scales the axis limits such that your data uses the entire axis range. If you then set this parameter to 30, the scope increases the y-axis or color range such that your data uses only 30% of the axis range.
**Tunable:** Yes

**Align — Alignment along axes**  
Center (default) | Bottom | Top | Left | Right

Specify where the scope aligns your data along the axis when it scales the axes. If the spectrogram is displayed, specify where the scope aligns your data along the axis when it scales the color. If you are using CCDF Measurements (DSP System Toolbox), the x axis is also configurable.

**Tunable:** Yes

### Algorithms

**Welch's Method**

When you set the Method property to Welch, the following algorithms apply. The Spectrum Analyzer uses the RBW or the Window Length setting in the Spectrum Settings pane to determine the data window length. Then, it partitions the input signal into a number of windowed data segments. Finally, Spectrum Analyzer uses the modified periodogram method to compute spectral updates, averaging the windowed periodograms for each segment.
Spectrum Analyzer requires that a minimum number of samples to compute a spectral estimate. This number of input samples required to compute one spectral update is shown as **Samples/update** in the **Main options** pane. This value is directly related to resolution bandwidth, **RBW**, by the following equation, or to the window length, by the equation shown in step 2.

$$N_{samples} = \left(1 - \frac{O_p}{100}\right) \times \frac{NENBW \times F_s}{RBW}$$

The normalized effective noise bandwidth, **NENBW**, is a factor that depends on the windowing method. Spectrum Analyzer shows the value of **NENBW** in the **Window Options** pane of the **Spectrum Settings** pane. **Overlap percentage**, **$O_p$**, is the value of the **Overlap %** parameter in the **Window Options** pane of the **Spectrum Settings** pane. **$F_s$** is the sample rate of the input signal. Spectrum Analyzer shows sample rate in the **Main Options** pane of the **Spectrum Settings** pane.

1. When in **RBW (Hz)** mode, the window length required to compute one spectral update, **$N_{window}$**, is directly related to the resolution bandwidth and normalized effective noise bandwidth:

$$N_{window} = \frac{NENBW \times F_s}{RBW}$$

When in **Window Length** mode, the window length is used as specified.

2. The number of input samples required to compute one spectral update, **$N_{samples}$**, is directly related to the window length and the amount of overlap by the following equation.

$$N_{samples} = \left(1 - \frac{O_p}{100}\right)N_{window}$$

When you increase the overlap percentage, fewer new input samples are needed to compute a new spectral update. For example, if the window length is 100, then the number of input samples required to compute one spectral update is given as shown in the following table.

<table>
<thead>
<tr>
<th>$O_p$</th>
<th>$N_{samples}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0%</td>
<td>100</td>
</tr>
</tbody>
</table>
The normalized effective noise bandwidth, \( NENBW \), is a window parameter determined by the window length, \( N_{\text{window}} \), and the type of window used. If \( w(n) \) denotes the vector of \( N_{\text{window}} \) window coefficients, then \( NENBW \) is given by the following equation.

\[
NENBW = N_{\text{window}} \times \frac{\sum_{n=1}^{N_{\text{window}}} w^2(n)}{\left( \sum_{n=1}^{N_{\text{window}}} w(n) \right)^2}
\]

When in RBW (Hz) mode, you can set the resolution bandwidth using the value of the RBW (Hz) parameter on the Main options pane of the Spectrum Settings pane. You must specify a value to ensure that there are at least two RBW intervals over the specified frequency span. The ratio of the overall span to RBW must be greater than two:

\[
\frac{\text{span}}{\text{RBW}} > 2
\]

By default, the RBW (Hz) parameter on the Main options pane is set to Auto. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span. When you set RBW (Hz) to Auto, RBW is calculated as:

\[
\text{RBW}_{\text{auto}} = \frac{\text{span}}{1024}
\]

When in Window Length mode, you specify \( N_{\text{window}} \) and the resulting RBW is:

\[
\frac{NENBW \times F_s}{N_{\text{window}}}
\]

Sometimes, the number of input samples provided are not sufficient to achieve the resolution bandwidth that you specify. When this situation occurs, Spectrum Analyzer displays a message.
Spectrum Analyzer removes this message and displays a spectral estimate when enough data has been input.

**Note** The number of FFT points \( (N_{\text{fft}}) \) is independent of the window length \( (N_{\text{window}}) \). You can set them to different values if \( N_{\text{fft}} \) is greater than or equal to \( N_{\text{window}} \).

**Filter Bank**

When you set the **Method** property to **Filter Bank**, the following algorithms apply. The Spectrum Analyzer uses the **RBW (Hz)** or the **Number of frequency band** property in the **Spectrum Settings** pane to determine the input frame length.

Spectrum Analyzer requires a minimum number of samples to compute a spectral estimate. This number of input samples required to compute one spectral update is shown as **Samples/update** in the **Main options** pane. This value is directly related to resolution bandwidth, \( RBW \), by the following equation.

\[
N_{\text{samples}} = \frac{F_s}{RBW}
\]

\( F_s \) is the sample rate of the input signal. Spectrum Analyzer shows sample rate in the **Main Options** pane of the **Spectrum Settings** pane.

1. When in **RBW (Hz)** mode, you can set the resolution bandwidth using the value of the **RBW (Hz)** parameter on the **Main options** pane of the **Spectrum Settings** pane. You must specify a value to ensure that there are at least two RBW intervals over the specified frequency span. The ratio of the overall span to RBW must be greater than two:
\[ \frac{\text{span}}{\text{RBW}} > 2 \]

By default, the \textbf{RBW} parameter on the \textbf{Main options} pane is set to \textbf{Auto}. In this case, the Spectrum Analyzer determines the appropriate value to ensure that there are 1024 RBW intervals over the specified frequency span. Thus, when you set \textbf{RBW} to \textbf{Auto}, it is calculated by the following equation.

\[ \text{RBW}_{\text{auto}} = \frac{\text{span}}{1024} \]

2. When in \textbf{Number of frequency bands} mode, you specify the input frame size. When the number of frequency bands is \textbf{Auto}, the resulting RBW is:

\[ \text{RBW} = \frac{F_s}{\text{Input Frame Size}} \]

When the number of frequency bands is manually specified, the resulting RBW is:

\[ \text{RBW} = \frac{F_s}{\text{FFTLength}} \]

For more information about the filter bank algorithm, see “Polyphase Implementation” (DSP System Toolbox).

Sometimes, the number of input samples provided are not sufficient to achieve the resolution bandwidth that you specify. When this situation occurs, Spectrum Analyzer displays a message:

![The Spectrum Analyzer requires 75 samples to update the display. It will update once the required number of samples have been input.]

Spectrum Analyzer removes this message and displays a spectral estimate when enough data has been input.
Nyquist frequency interval

When the PlotAsTwoSidedSpectrum property is set to true, the interval is \( \left[ -\frac{\text{SampleRate}}{2}, \frac{\text{SampleRate}}{2} \right] + \text{FrequencyOffset} \) hertz.

When the PlotAsTwoSidedSpectrum property is set to false, the interval is \( \left[ 0, \frac{\text{SampleRate}}{2} \right] + \text{FrequencyOffset} \) hertz.

Periodogram and Spectrogram

Spectrum Analyzer calculates and plots the power spectrum, power spectrum density, and RMS computed by the modified Periodogram estimator. For more information about the Periodogram method, see periodogram.

Power Spectral Density — The power spectral density (PSD) is given by the following equation.

\[
\text{PSD}(f) = \frac{1}{P} \sum_{p=1}^{P} \left( \sum_{n=1}^{N_{\text{FFT}}} x_p[n] e^{-j2\pi f(n-1)T} \right)^2 \\
F_s \times \sum_{n=1}^{N_{\text{window}}} w[n]
\]

In this equation, \( x[n] \) is the discrete input signal. On every input signal frame, Spectrum Analyzer generates as many overlapping windows as possible, with each window denoted as \( x^{(p)}[n] \), and computes their periodograms. Spectrum Analyzer displays a running average of the \( P \) most current periodograms.

Power Spectrum — The power spectrum is the product of the power spectral density and the resolution bandwidth, as given by the following equation.
\[ P_{\text{spectrum}}(f) = \text{PSD}(f) \times RBW = \text{PSD}(f) \times \frac{F_s \times NENBW}{N_{\text{window}}} \]

\[
= \frac{1}{P} \sum_{p=1}^{P} \left| \sum_{n=1}^{N_{\text{FFT}}} x^p[n] e^{-j2\pi f(n-1)T} \right|^2 \left( \sum_{n=1}^{N_{\text{window}}} w[n] \right)^2
\]

**Frequency Vector**

When set to \textit{Auto}, the frequency vector for frequency-domain input is calculated by the software.

When the \textit{PlotAsTwoSidedSpectrum} property is set to true, the frequency vector is:

\[
\left[ -\frac{\text{SampleRate}}{2}, \frac{\text{SampleRate}}{2} \right]
\]

When the \textit{PlotAsTwoSidedSpectrum} property is set to false, the frequency vector is:

\[
\left[ 0, \frac{\text{SampleRate}}{2} \right]
\]

**Occupied BW**

The \textit{Occupied BW} is calculated as follows.

1. Calculate the total power in the measured frequency range.
2. Determine the lower frequency value. Starting at the lowest frequency in the range and moving upward, the power distributed in each frequency is summed until this result is

\[
100 - \frac{\text{OccupiedBW}}{2}
\]

of the total power.
3 Determine the upper frequency value. Starting at the highest frequency in the range and moving downward, the power distributed in each frequency is summed until the result reaches

\[
100 - \frac{\text{OccupiedBW\%}}{2}
\]

of the total power.

4 The bandwidth between the lower and upper power frequency values is the occupied bandwidth.

5 The frequency halfway between the lower and upper frequency values is the center frequency.

**Distortion Measurements**

The *Distortion Measurements* are computed as follows.

1 Spectral content is estimated by finding peaks in the spectrum. When the algorithm detects a peak, it records the width of the peak and clears all monotonically decreasing values. That is, the algorithm treats all these values as if they belong to the peak. Using this method, all spectral content centered at DC (0 Hz) is removed from the spectrum and the amount of bandwidth cleared \((W_0)\) is recorded.

2 The fundamental power \((P_1)\) is determined from the remaining maximum value of the displayed spectrum. A local estimate \((F_e_1)\) of the fundamental frequency is made by computing the central moment of the power near the peak. The bandwidth of the fundamental power content \((W_1)\) is recorded. Then, the power from the fundamental is removed as in step 1.

3 The power and width of the higher-order harmonics \((P_2, W_2, P_3, W_3, \text{etc.})\) are determined in succession by examining the frequencies closest to the appropriate multiple of the local estimate \((F_e_1)\). Any spectral content that decreases monotonically about the harmonic frequency is removed from the spectrum first before proceeding to the next harmonic.

4 Once the DC, fundamental, and harmonic content is removed from the spectrum, the power of the remaining spectrum is examined for its sum \((P_{\text{remaining}})\), peak value \((P_{\text{maxspur}})\), and median value \((P_{\text{esnoise}})\).

5 The sum of all the removed bandwidth is computed as \(W_{\text{sum}} = W_0 + W_1 + W_2 + \ldots + W_n\).
The sum of powers of the second and higher-order harmonics are computed as:
\[ P_{\text{harmonic}} = P_2 + P_3 + P_4 + \ldots + P_n. \]

6 The sum of the noise power is estimated as:
\[ P_{\text{noise}} = (P_{\text{remaining}} \cdot dF + P_{\text{est. noise}} \cdot W_{\text{sum}})/RBW \]
Where \( dF \) is the absolute difference between frequency bins, and \( RBW \) is the resolution bandwidth of the window.

7 The metrics for SNR, THD, SINAD, and SFDR are then computed from the estimates.

\[
THD = 10 \cdot \log_{10}\left(\frac{P_{\text{harmonic}}}{P_1}\right)
\]
\[
SINAD = 10 \cdot \log_{10}\left(\frac{P_1}{P_{\text{harmonic}} + P_{\text{noise}}}\right)
\]
\[
SNR = 10 \cdot \log_{10}\left(\frac{P_1}{P_{\text{noise}}}\right)
\]
\[
SFDR = 10 \cdot \log_{10}\left(\frac{P_1}{\max(P_{\text{maxspur}}, \max(P_2, P_3, \ldots, P_n))}\right)
\]

Harmonic Measurements

1 The harmonic distortion measurements use the spectrum trace shown in the display as the input to the measurements. The default Hann window setting of the Spectrum Analyzer may exhibit leakage that can completely mask the noise floor of the measured signal.
The harmonic measurements attempt to correct for leakage by ignoring all frequency content that decreases monotonically away from the maximum of harmonic peaks. If the window leakage covers more than 70% of the frequency bandwidth in your spectrum, you may see a blank reading (–) reported for **SNR** and **SINAD**. If your application can tolerate the increased equivalent noise bandwidth (ENBW), consider using a Kaiser window with a high attenuation (up to 330 dB) to minimize spectral leakage.
The DC component is ignored.

After windowing, the width of each harmonic component masks the noise power in the neighborhood of the fundamental frequency and harmonics. To estimate the noise power in each region, Spectrum Analyzer computes the median noise level in the nonharmonic areas of the spectrum. It then extrapolates that value into each region.

$N^{th}$ order intermodulation products occur at $A*F1 + B*F2$, where $F1$ and $F2$ are the sinusoid input frequencies and $|A| + |B| = N$. $A$ and $B$ are integer values.

For intermodulation measurements, the third-order intercept (TOI) point is computed as follows, where $P$ is power in decibels of the measured power referenced to 1 milliwatt (dBm):
\[ TOI_{\text{lower}} = P_{F1} + (P_{F2} - P_{(2F1,F2)})/2 \]
\[ TOI_{\text{upper}} = P_{F2} + (P_{F1} - P_{(2F2,F1)})/2 \]
\[ TOI = + (TOI_{\text{lower}} + TOI_{\text{upper}})/2 \]

**Averaging Method**

The moving averaging is done by using one of two methods:

- **Running** — For each frame of input, average the last \( N \) scaled \( Z \) vectors that are computed by the algorithm. The variable \( N \) is the value you specify for the number of spectral averages. If the algorithm does not have enough \( Z \) vectors, the algorithm uses zeros to fill the empty elements.

- **Exponential** — The moving average using the exponential weighting method is computed over the current \( Z \) vector and the previous \( Z \) vector. For details on the computation, see “Exponential Weighting Method” (DSP System Toolbox) in the \texttt{dsp.MovingAverage} object.

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

This block can be used for simulation visibility in systems that generate code, but is not included in the generated code.

**HDL Code Generation**

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

**PLC Code Generation**

Generate Structured Text code using Simulink® PLC Coder™.
This block can be used for simulation visibility in systems that generate PLC code, but is not included in the generated code.

**Fixed-Point Conversion**
Design and simulate fixed-point systems using Fixed-Point Designer™.

This block accepts fixed-point input, but converts it to double for display.

Slider Switch

Toggle parameter between two values
Library: Simulink / Dashboard

Description

The Slider Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Slider Switch block to a Switch block in your model and change its state during simulation. Use the Slider Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Slider Switch block does not open its dialog box during simulation and when the block is selected. To edit the block’s parameters, you can use the Property Inspector, or you can right-click the block and select Block Parameters from the context menu.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.

Note Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using Ctrl+D.
To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.

In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

**Parameter Logging**

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`. 
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the Connection table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the Connection table. For example, a block parameter defined as engine(1) using the variable engine does not appear in the table.

To access the parameter in the Connection table, assign the indexed value to a scalar variable, such as engine_1. Then, use the scalar variable to define the block parameter.
- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the Default parameter behavior set to Inlined, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its Gain parameter using the Dashboard blocks, but the Gain value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect
variable and parameter connection options

Select the variable or block parameter to control using the Connection table. Populate the Connection table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click **Apply**. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

### Programmatic Use

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** **Binding**  
**Type:** `Simulink.HMI.ParamSourceInfo`  
**Default:** `[]`

**States — Pair values and labels**  
Scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Left** and **Right** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

**States**

<table>
<thead>
<tr>
<th>Position</th>
<th>State Value</th>
<th>State Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left</td>
<td>0</td>
<td>on</td>
</tr>
<tr>
<td>Right</td>
<td>1</td>
<td>off</td>
</tr>
</tbody>
</table>
Programmatic Use

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array containing two elements with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

```matlab
leftState.Value = 0;
leftState.Label = 'Off';
rightState.Value = 1;
rightState.Label = 'On';
switchStates = [leftState rightState];
```

**Block Parameter:** States  
**Type:** two element array of structures

**Label — Block label position**  
**Top** (default) | **Bottom** | **Hide**

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

Programmatic Use

**Block Parameter:** LabelPosition  
**Type:** character vector  
**Values:** 'Top' | 'Bottom' | 'Hide'  
**Default:** 'Top'

Sqrt

Calculate square root, signed square root, or reciprocal of square root

Library:  Simulink / Math Operations
         HDL Coder / HDL Floating Point Operations
         HDL Coder / Math Operations

Description

The Sqrt block calculates the square root, signed square root, or reciprocal of square root on the input signal. Select one of the following functions from the Function parameter list.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Mathematical Expression</th>
<th>MATLAB Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqrt</td>
<td>Square root of the input</td>
<td>$u^{0.5}$</td>
<td>sqrt</td>
</tr>
<tr>
<td>signedSqrt</td>
<td>Square root of the absolute value of the input, multiplied by the sign of the input</td>
<td>$\text{sign}(u)\times</td>
<td>u</td>
</tr>
<tr>
<td>rSqrt</td>
<td>Reciprocal of the square root of the input</td>
<td>$u^{-0.5}$</td>
<td>—</td>
</tr>
</tbody>
</table>

The block icon changes to match the function.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix
Input signal to the block to calculate the square root, signed square root, or reciprocal of square root. The sqrt function accepts real or complex inputs, except for complex fixed-point signals. signedSqrt and rSqrt do not accept complex inputs. For the signedSqrt function, the input signal must be a floating point number.

If the input is negative, set the **Output signal** to complex for all functions except signedSqrt.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Output**

**Port_1 — Output signal**

```
scalar | vector | matrix
```

Output signal that is the square root, signed square root, or reciprocal of square root of the input signal. When the input is an integer or fixed-point type, the output must be floating point.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Parameters**

**Main**

**Function — Function the block performs**

```
sqrt (default) | signedSqrt | rSqrt
```

Specify the mathematical function that the block calculates. The block icon changes to match the function you select.

<table>
<thead>
<tr>
<th>Function</th>
<th>Block Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqrt</td>
<td><img src="image" alt="sqrt Icon" /></td>
</tr>
<tr>

<td>------------</td>
</tr>
<tr>
<td>signedSqrt</td>
<td>![signedSqrt Icon]</td>
</tr>
<tr>
<td>rSqrt</td>
<td>![rSqrt Icon]</td>
</tr>
</tbody>
</table>

**Dependency**

When this parameter is set to `signedSqrt`, the Intermediate results data type parameter is disabled.

**Programmatic Use**

Block Parameter: Operator  
Type: character vector  
Values: 'sqrt' | 'signedSqrt' | 'rSqrt'  
Default: 'sqrt'

**Output signal type — Output signal type**

auto (default) | real | complex

Specify the output signal type of the block.

<table>
<thead>
<tr>
<th>Function</th>
<th>Input Signal Type</th>
<th>Output Signal Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Auto</td>
<td>Real</td>
</tr>
<tr>
<td>sqrt</td>

</tr>
<tr>
<td>rSqrt</td>
<td>real</td>
<td>real</td>
</tr>
<tr>
<td></td>
<td>complex</td>
<td>error</td>
</tr>
</tbody>
</table>
**Programmatic Use**

**Block Parameter:** OutputSignalType  
**Type:** character vector  
**Values:** 'auto' | 'real' | 'complex'  
**Default:** 'auto'

**Sample time — Specify sample time as a value other than -1**

-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

**Programmatic Use**

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar or vector  
**Default:** ' -1'

**Algorithm**

**Method — Method to compute reciprocal of square root**

Exact (default) | Newton-Raphson

Specify the method for computing the reciprocal of a square root. This parameter is only valid for the rSqrt function.

<table>
<thead>
<tr>
<th>Method</th>
<th>Data Types Supported</th>
<th>When to Use This Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exact</td>
<td>Floating point</td>
<td>You do not want an approximation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> The input or output must be floating point.</td>
</tr>
<tr>
<td>Newton-Raphson</td>
<td>Floating-point, fixed-point, and built-in integer types</td>
<td>You want a fast, approximate calculation.</td>
</tr>
</tbody>
</table>

The Exact method provides results that are consistent with MATLAB computations.
The algorithms for sqrt and signedSqrt are always of Exact type, no matter what selection appears on the block dialog box.

Programmatic Use
Block Parameter: AlgorithmType
Type: character vector
Values: 'Exact' | 'Newton-Raphson'
Default: 'Exact'

Number of iterations — Number of iterations used for Newton Raphson algorithm
3 (default) | integer

Specify the number of iterations to perform the Newton-Raphson algorithm. This parameter is valid with the rSqrt function and the Newton-Raphson value for Method.

Note If you enter 0, the block output is the initial guess of the Newton-Raphson algorithm.

Programmatic Use
Block Parameter: Iterations
Type: character vector
Values: integer
Default: '3'

Data Types

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Intermediate results data type — Data type of intermediate results
Inherit:Inherit via internal rule (default) | Inherit: Inherit from input | Inherit: Inherit from output | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16,,0) | fixdt(1,16,2^0,0) | <data type expression>
Specify the data type for intermediate results when you set Function to \texttt{sqrt} or \texttt{rSqrt} on the \texttt{Main} pane.

The type can be inherited, specified directly, or expressed as a data type object such as \texttt{Simulink.NumericType}.

Follow these guidelines on setting an intermediate data type explicitly for the square root function, \texttt{sqrt}:

<table>
<thead>
<tr>
<th>Input and Output Data Types</th>
<th>Intermediate Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input or output is double.</td>
<td>Use double.</td>
</tr>
<tr>
<td>Input or output is single, and any non-single data type is \textit{not} double.</td>
<td>Use single or double.</td>
</tr>
<tr>
<td>Input and output are fixed point.</td>
<td>Use fixed point.</td>
</tr>
</tbody>
</table>

Follow these guidelines on setting an intermediate data type explicitly for the reciprocal square root function, \texttt{rSqrt}:

<table>
<thead>
<tr>
<th>Input and Output Data Types</th>
<th>Intermediate Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input is double and output is not single.</td>
<td>Use double.</td>
</tr>
<tr>
<td>Input is not single and output is double.</td>
<td>Use double.</td>
</tr>
<tr>
<td>Input and output are fixed point.</td>
<td>Use fixed point.</td>
</tr>
</tbody>
</table>

\textbf{Caution} Do not set \textit{Intermediate results data type} to \texttt{Inherit:Inherit from output} when:

- You select \texttt{Newton-Raphson} to compute the reciprocal of a square root.
- The input data type is floating point.
- The output data type is fixed point.

Under these conditions, selecting \texttt{Inherit:Inherit from output} yields suboptimal performance and produces an error.

To avoid this error, convert the input signal from a floating-point to fixed-point data type. For example, insert a Data Type Conversion block in front of the Sqrt block to perform the conversion.
Dependency

This parameter is disabled when the Function parameter is set to signedSqrt.

Programmatic Use

**Block Parameter:** IntermediateResultsDataTypeStr  
**Type:** character vector  
**Values:**  
- 'Inherit: Inherit via internal rule'  
- 'Inherit: Inherit from input'  
- 'Inherit: Inherit from output'  
- 'double'  
- 'single'  
- 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), '<data type expression>'  
**Default:** 'Inherit: Inherit via internal rule'

Output — Output data type

**Inherit:**  
- Same as first input (default)  
- Inherit via internal rule  
- Inherit via back propagation  
- double  
- single  
- int8  
- int16  
- uint8  
- uint16  
- int32  
- uint32  
- int64  
- uint64  
- fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0), '<data type expression>'  
**Default:** 'Inherit: Inherit via internal rule'

Specify the output data type. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr  
**Type:** character vector  
**Values:**  
- 'Inherit: Inherit via internal rule'  
- 'Inherit: Inherit via back propagation'  
- 'Inherit: Same as first input'  
- 'double'  
- 'single'  
- 'int8', 'uint8', 'int16', 'uint16', 'int32', 'uint32', 'int64', 'uint64', fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0), '<data type expression>'  
**Default:** 'Inherit: Same as first input'

Minimum — Minimum output value for range checking

**[]** (default) | **scalar**

Specify the lower value of the output range that Simulink checks as a finite, real, double, scalar value.

**Note**  
If you specify a bus object as the data type for this block, do not set the minimum value for bus data on the block. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum parameter for a bus element, see Simulink.BusElement.
Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** `OutMin`  
**Type:** character vector  
**Values:** scalar  
**Default:** `'[ ]'`

**Maximum — Maximum output value for range checking**  
`[]` (default) | scalar

Specify the upper value of the output range that Simulink checks as a finite, real, double, scalar value.

**Note** If you specify a bus object as the data type for this block, do not set the maximum value for bus data on the block. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum parameter for a bus element, see `Simulink.BusElement`.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
• Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**
**Block Parameter:** OutMax
**Type:** character vector
**Values:** scalar
**Default:** ['[ ]']

**Integer rounding mode — Rounding mode for fixed-point operations**
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

**Programmatic Use**
**Block Parameter:** RndMeth
**Type:** character vector
**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
**Default:** 'Floor'

**Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types**
off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).
**Programmatic Use**

**Block Parameter:** LockScale  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Saturate on integer overflow — Choose the behavior when integer overflow occurs**  
on (default) | boolean

<table>
<thead>
<tr>
<th>Action</th>
<th>Reasons for Taking This Action</th>
<th>What Happens for Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box.</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Action</td>
<td>Reasons for Taking This Action</td>
<td>What Happens for Overflows</td>
<td>Example</td>
</tr>
<tr>
<td>--------</td>
<td>--------------------------------</td>
<td>-----------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Do not select this check box.</td>
<td>You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

**Programmatic Use**

**Block Parameter:** SaturateOnIntegerOverflow  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'on'

</tr>
</tbody>
</table>
General

| UseMultiplier | Select algorithm for SqrtBitset implementation. The default is off. |

Note The Sqrt block does not support HDL code generation with double data types in the Native Floating Point mode.

Native Floating Point

| HandleDenormals | Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is inherit. See also “HandleDenormals” (HDL Coder). |
| LatencyStrategy | Specify whether to map the blocks in your design to inherit, Max, Min, Zero, or Custom for the floating-point operator. The default is inherit. See also “LatencyStrategy” (HDL Coder). |
| NFPCustomLatency | To specify a value, set LatencyStrategy to Custom. HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder). |

Restrictions

- Input must be an unsigned scalar value.
- Output is a fixed-point scalar value.

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced in R2010a
Squeeze

Remove singleton dimensions from multidimensional signal

Library: Simulink / Math Operations

Description

The Squeeze block removes singleton dimensions from its multidimensional input signal. A singleton dimension is any dimension whose size is one. The Squeeze block operates only on signals whose number of dimensions is greater than two. Scalar, vector, and matrix signals pass through the Squeeze block unchanged.

Ports

Input

Port_1 — Multidimensional input signal
multidimensional signal

Input signal that has any singleton dimensions removed in the output.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal with no singleton dimensions
multidimensional signal

Output signal with no singleton dimensions. For example, a multidimensional array of size 3-by-1-by-2 changes into a 3-by-2 signal. If there are no singleton dimensions in the input, then the input signal is passed through unchanged to the output.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Library: Simulink / Signal Routing

Description

The State Reader block reads the current state of a supported state owner block. When creating a library block with a State Reader block also include the state owner block.

Add a State Reader block to your model from the Simulink Library Browser.

State Reader blocks can read state from these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Conditional subsystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem.
- S-Function with multiple discrete states.

To configure an S-Function block as a state owner block, exactly one data type work vector must be declared as discrete state vector using ssSetDWorkUsedAsDState and named using ssSetDWorkName or ssSetDWorkRTWIdentifier in mdlInitializeSizes.
Ports

Output

**Out** — State value

scalar | vector

State value read from a state owner block.

The dimension of the output is the dimension of the full state vector. Refer to the **Initial conditions** parameter for specific blocks. For example, for a Delay block with a **Delay length** of \(N\), the State Reader block returns a state vector of length \([1 \times N]\).

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

**State owner block** — Show the state owner block

none (default)

Show the state owner block whose state this block is reading. To change the state owner block, select a block from the **State Owner Selector Tree**.

**Programmatic Use**

**Block Parameter:** StateOwnerBlock

**Type:** character vector

**Value:** '' | '<model path/block name>'

**Default:** ''

State Writer

Write to a block state

Library: Simulink / Signal Routing

Description

The State Writer block sets the state of a supported state owner block. When creating a library block with a State Writer block also include the state owner block.

Add a State Writer block to your model from the Simulink Library Browser.

State Writer blocks can write state to these state owner blocks:

- Discrete State-Space
- Discrete-Time Integrator
- Delay
- Unit Delay
- Discrete Transfer Fcn
- Discrete Filter
- Discrete FIR Filter
- Integrator
- Second-Order Integrator
- Conditional subsystem blocks such as Enabled Subsystem, Triggered Subsystem, and Function-Call Subsystem.
- S-Function with multiple discrete states.

To configure an S-Function block as a state owner block, exactly one data type work vector must be declared as discrete state vector using ssSetDWorkUsedAsDState and named using ssSetDWorkName or ssSetDWorkRTWIdentifier in mdlInitializeSizes.
Ports

Input

In — State value
scalar | vector

State value written to a state owner block.

When writing to a state owner block with an input scalar, the scalar value is expanded to match the dimension of the state. All elements of the state are set to the same value.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

State owner block — Show the state owner block
none (default)

Show the state owner block whose state this block is writing. To change the state owner block, select a block from the State Owner Selector Tree.

Programmatic Use
Block Parameter: StateOwnerBlock
Type: character vector
Value: '' | '<model path/block name>'
Default: ''

State-Space

Implement linear state-space system
Library: Simulink / Continuous

Description

The State-Space block implements a system whose behavior you define as

\[
\begin{align*}
\dot{x} &= Ax + Bu \\
y &= Cx + Du \\
x|_{t=t_0} &= x_0,
\end{align*}
\]

where \( x \) is the state vector, \( u \) is the input vector, \( y \) is the output vector, and \( x_0 \) is the initial condition of the state vector. The matrix coefficients must have these characteristics:

- \( A \) must be an \( n \)-by-\( n \) matrix, where \( n \) is the number of states.
- \( B \) must be an \( n \)-by-\( m \) matrix, where \( m \) is the number of inputs.
- \( C \) must be an \( r \)-by-\( n \) matrix, where \( r \) is the number of outputs.
- \( D \) must be an \( r \)-by-\( m \) matrix.

In general, the block has one input port and one output port. The number of rows in \( C \) or \( D \) matrix is the same as the width of the output port. The number of columns in the \( B \) or \( D \) matrix are the same as the width of the input port. If you want to model an autonomous linear system with no inputs, set the \( B \) and \( D \) matrices to empty. In this case, the block acts as a source block with no input port and one output port, and implements the following system:

\[
\begin{align*}
\dot{x} &= Ax \\
y &= Cx \\
x|_{t=t_0} &= x_0.
\end{align*}
\]
Simulink software converts a matrix containing zeros to a sparse matrix for efficient multiplication.

**Ports**

**Input**

Port_1 — Input signal
scalar | vector

Real-valued input vector of type double, where the width equals the number of columns in the B and D matrices. For more information, see “Description” on page 1-1979.

Data Types: double

**Output**

Port_1 — Output vector
scalar | vector

Real-valued output vector of data type double, with width equal to the number of rows in the C and D matrices. For more information, see “Description” on page 1-1979.

Data Types: double

**Parameters**

A — Matrix coefficient, A
1 (default) | scalar | vector | matrix

Specify the matrix coefficient A, as a real-valued n-by-n matrix, where n is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1979.

**Programmatic Use**

Block Parameter: A
Type: character vector, string
Values: scalar | vector | matrix
Default: '1'
**B — Matrix coefficient, B**

1 (default) | scalar | vector | matrix

Specify the matrix coefficient $B$, as a real-valued $n$-by-$m$ matrix, where $n$ is the number of states and $m$ is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1979.

**Programmatic Use**

**Block Parameter:** $B$

Type: character vector, string

Values: scalar | vector | matrix

Default: '1'

**C — Matrix coefficient, C**

1 (default) | scalar | vector | matrix

Specify the matrix coefficient $C$ as a real-valued $r$-by-$n$ matrix, where $r$ is the number of outputs and $n$ is the number of states. For more information on the matrix coefficients, see “Description” on page 1-1979.

**Programmatic Use**

**Block Parameter:** $C$

Type: character vector, string

Values: scalar | vector | matrix

Default: '1'

**D — Matrix coefficient, D**

1 (default) | scalar | vector | matrix

Specify the matrix coefficient $D$ as a real-valued $r$-by-$m$ matrix, where $r$ is the number of outputs and $m$ is the number of inputs. For more information on the matrix coefficients, see “Description” on page 1-1979.

**Programmatic Use**

**Block Parameter:** $D$

Type: character vector, string

Values: scalar | vector | matrix

Default: '1'

**Initial conditions — Initial state vector**

0 (default) | scalar | vector

Specify the initial state vector.
Limitations

The initial conditions of this block cannot be \texttt{inf} or \texttt{NaN}.

Programmatic Use
Block Parameter: \texttt{X0}
Type: character vector, string
Values: scalar | vector
Default: '0'

Absolute tolerance — Absolute tolerance for computing block states
auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify auto or -1.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter auto or -1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use
Block Parameter: \texttt{AbsoluteTolerance}
Type: character vector, string
Values: 'auto' | '-1' | any positive real-valued scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Assign unique name to each state
' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, { 'a', 'b', 'c'}. Each name must be unique.
To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

**Limitations**

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

**Programmatic Use**

**Block Parameter:** ContinuousStateAttributes  
**Type:** character vector, string  
**Values:** ' ' | user-defined  
**Default:** ' '

**Block Characteristics**

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Topics
“State”

Introduced before R2006a
Step

Generate step function

Library: Simulink / Sources

Description

The Step block provides a step between two definable levels at a specified time. If the simulation time is less than the Step time parameter value, the block's output is the Initial value parameter value. For simulation time greater than or equal to the Step time, the output is the Final value parameter value.

The numeric block parameters must be of the same dimensions after scalar expansion. If the Interpret vector parameters as 1-D option is off, the block outputs a signal of the same dimensions and dimensionality as the parameters. If the Interpret vector parameters as 1-D option is on and the numeric parameters are row or column vectors (that is, single-row or column 2-D arrays), the block outputs a vector (1-D array) signal. Otherwise, the block outputs a signal of the same dimensionality and dimensions as the parameters.

Ports

Output

Port_1 — Output step signal
scalar | vector

Output step function signal defined by the parameters Step time, Initial value, and Final value.

Data Types: double
Parameters

Step time — Time when step occurs
1 (default) | scalar

Specify the time, in seconds, when the output jumps from the Initial value parameter to the Final value parameter.

Programmatic Use
Block Parameter: Time
Type: character vector
Values: '1' | real- or complex-valued scalar, vector, or matrix
Default: '1'

Initial value — Output value before step
0 (default) | scalar

Specify the block output until the simulation time reaches the Step time parameter.

Programmatic Use
Block Parameter: Before
Type: character vector
Values: '1' | real- or complex-valued scalar, vector, or matrix
Default: '0'

Final value — Output value after step
1 (default) | scalar

Specify the block output when the simulation time reaches and exceeds the Step time parameter.

Programmatic Use
Block Parameter: After
Type: character vector
Values: '1' | real- or complex-valued scalar, vector, or matrix
Default: '1'

Sample time — Sample rate
0 (default) | scalar

Specify the sample rate of step. See “Specify Sample Time” for more information.
Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar
Default: '0'

Interpret vector parameters as 1-D — Treat vectors as 1-D
on (default) | off

Select this check box to output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.

• When you select this check box, the block outputs a vector of length N if the Constant value parameter evaluates to an N-element row or column vector. For example, the block outputs a matrix of dimension 1-by-N or N-by-1.

• When you clear this check box, the block does not output a vector of length N if the Constant value parameter evaluates to an N-element row or column vector.

Programmatic Use
Block Parameter: VectorParams1D
Type: character vector
Values: 'on' | 'off'
Default: 'on'

Enable zero-crossing detection — Enable zero-crossing detection
on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector, string
Values: 'off' | 'on'
Default: 'on'

Stop Simulation

Stop simulation when input is nonzero

Library: Simulink / Sinks
HDL Coder / Sinks

Description

The Stop Simulation block stops the simulation when the input is nonzero. The simulation completes the current time step before terminating. If the block input is a vector, any nonzero vector element causes the simulation to stop.

When you use the Stop Simulation block in a For Iterator subsystem, the stop action occurs after execution of all iterations in the subsystem during a time step. The stop action does not interrupt execution until the start of the next time step.

You cannot use the Stop Simulation block to pause the simulation. To create a block that pauses the simulation, see “Pause Simulation Using Assertion Blocks”.

Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Stop simulation when input signal is nonzero. This port accepts real signals of double or Boolean data types.

Data Types: double | Boolean
Block Characteristics

String Compare

Compare two input strings
Library: Simulink / String

Description

String Compare compares two strings. To see if two strings are identical, use this block. You can specify if the match is case sensitive and how much of the string to compare.

Ports

Input

Port_1 — First string to compare
scalar

First string to compare, specified as a scalar.
Data Types: string

Port_2 — Second string to compare
scalar

Second string to compare, specified as a scalar.
Data Types: string

Output

Port_1 — True or false result
scalar

True or false result, specified as a scalar:
• 1 — Match.
• 0 — No match.

Data Types: Boolean

Parameters

Case sensitive — Case sensitivity for string comparison
on (default) | off

Case sensitivity for string comparison:

✓ on
  Consider string case when comparing strings.

☐ off
  Do not consider string case when comparing strings.

Compare Option — Amount of characters to compare
Entire string (default) | First N characters

Amount of string to compare:

• Entire string — Compare both entire strings.
• First N characters — Compare the first N characters of both strings.

Dependencies

Setting this parameter to First N characters enables the Number of characters parameter.

Number of characters — Number of characters to compare
1 (default) | scalar

Number of characters to compare

Dependencies

This parameter is enabled when the Compare Option parameter is set to First N characters.
Data Types: double

String Concatenate

Concatenate input strings to form one output string

**Library:** Simulink / String

Description

The String Concatenate block concatenates multiple input strings, in order of their input, to form one output string. Use this block if you want to combine multiple strings into a single string.

Ports

**Input**

*Port_1 — First input string*

scalar

First input string, specified as a scalar.

*Data Types: string*

*Port_2 — Second input string*

scalar

Second input string, specified as a scalar.

*Data Types: string*

**Output**

*Port_1 — Concatenated string*

scalar
Concatenated string, specified as a scalar.

Data Types: string

Parameters

Number of Inputs — Number of input strings
scalar

Number of input strings to concatenate, specified as a scalar. You can specify from 2 to 512 input ports.

Output data type — Output data type
string (default) | scalar

Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify stringtype(N). For example, stringtype(128) creates a string data type with a maximum length of 128 characters.

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the Simulink User's Guide for more information.

Mode — Category of data
stringtype(128) (default) | scalar

Use the stringtype function, for example, stringtype(128).

Dependency

Clicking the Show data type assistant button enables this parameter.

**String Constant**

Output specified string  
**Library:** Simulink / String

**Description**

The String Constant block outputs a string specified by the `String` parameter. Use this block when you want a constant whose type is string.

**Ports**

**Output**

*Port_1 — Output string*

*scalar*

Output string, specified as a scalar.  
Data Types: `string`

**Parameters**

*String — Input string*

"Hello!" (default) | scalar

Input string, specified as a scalar.

*Output data type — Output data type*

string (default) | scalar
Output data type, specified using the string data type to specify a string with no maximum length.

To specify a string data type with a maximum length, specify `stringtype(N)`. For example, `stringtype(31)` creates a string data type with a maximum length of 31 characters.

Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the Simulink User's Guide for more information.

String Find

Return index of first occurrence of pattern string

Library: Simulink / String

Description

The String Find block returns the index of the first occurrence of the pattern string `sub` in the text string `str`.

Ports

Input

`str` — String in which to find pattern

scalar

String in which to find pattern (`sub`), specified as a scalar.

Data Types: `string`

`sub` — Pattern

scalar

Pattern to be found in string (`str`), specified as a scalar.

Data Types: `string`

Output

`idx` — Position index of found pattern

scalar

Position index of the found pattern, specified as a positive integer scalar.
• If the block does not find the pattern, it returns -1.
• If the \texttt{sub} parameter is empty (""), the block returns 1, indicating that it matched the beginning of the searched string.

Data Types: int32

String Length

Output number of characters in input string

Library: Simulink / String

Description

The String Length block outputs the number of characters in the input string. For example, you can use the String Length block to move focus of attention to a particular location in a string.

Ports

Input

Port_1 — Input string
scalar

Input string, specified as a scalar.
Data Types: string

Output

Port_1 — Number of characters
scalar

Number of characters in the input string, specified as a scalar.
Data Types: uint16 | uint32

String to ASCII

Convert string signal to uint8 vector

Library: Simulink / String

Description

The String To ASCII block converts a string signal to a uint8 vector. The block converts each character in the string to its corresponding ASCII value. For example, the block converts the input string "Hello" to [72 101 108 108 111].

Ports

Input

Port_1 — Input string signal
scalar

Input string signal, specified as a scalar.
Data Types: string

Output

Port_1 — Converted uint8 vector signal
vector

Converted uint8 vector signal of ASCII characters from input string signal, specified as a vector. The block converts each element in the string into its ASCII character equivalent and outputs the ASCII equivalents as a vector. If there are fewer characters than the maximum length, the block fills the remaining space with zeros at simulation. At code generation, the block fills the remaining space with null characters.
Data Types: uint8
Parameters

**Output vector size — Size of output vector**
31 (default) | scalar

Size of output string vector, specified as a scalar.

Block Characteristics

String to Double

Convert string signal to double signal

Library: Simulink / String

Description

Scan String scans an input string and converts it to signals per the format specified by the Format parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the Format parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the Configuration Parameters > Code Generation > Interface > Support non-finite numbers check box.

Ports

Input

Port_1 — Input string

scalar

Input string, specified as a scalar.

Data Types: string
Output

d — Output data whose format matches %d format
scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in Format, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

f — Output data whose format matches %f format
scalar

Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port N — Output data whose format matches N format
scalar

Output data whose format matches N format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Format — Format operator for input
"%lf" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the sscanf function return, which is an empty matrix if the function cannot match the input with the specified format.
- For the String to Double block, this parameter has a default value of `%lf`.
- For the String to Single block, this parameter has a default value of `%f`.

For more information about acceptable format operators, see the Algorithms section.

### Block Characteristics

<td></td>
</tr>
</tbody>
</table>

### Algorithms

The Scan String block uses this format specifier prototype:

```
%[width][length]specifier
```

### Numeric Fields

This table lists available conversion specifiers to convert text to numeric outputs. The block converts values to their decimal (base 10) representation.

<table>
<thead>
<tr>
<th>Output Port Data Type</th>
<th>ConversionSpecifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer, signed</td>
<td><code>%d</code></td>
<td>Base 10</td>
</tr>
<tr>
<td>Integer, unsigned</td>
<td><code>%u</code></td>
<td>Base 10</td>
</tr>
<tr>
<td>Output Port Data Type</td>
<td>Conversion Specifier</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Floating-point number</td>
<td>%f, %e, or %g</td>
<td>Floating-point values. Input fields can contain NaN (case sensitive). Input fields that represents floating-point numbers can include leading + or - symbols and exponential notation using e or E. The conversion specifiers %f, %e, and %g all treat input fields the same way.</td>
</tr>
</tbody>
</table>

**Character Fields**

This table lists available conversion specifiers to convert text so that the output is a character array.

<table>
<thead>
<tr>
<th>Character Field Type</th>
<th>Conversion Specifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String scalar</td>
<td>%s</td>
<td>Read the text until the block encounters whitespace.</td>
</tr>
<tr>
<td></td>
<td>%c</td>
<td>Read any single character, including whitespace. To read multiple characters at a time, specify field width. For example, %10c reads 10 characters at a time.</td>
</tr>
<tr>
<td>Pattern-matching</td>
<td>%[...]</td>
<td>Read only characters in the brackets up to the first nonmatching character or whitespace.</td>
</tr>
<tr>
<td></td>
<td>%[^...]</td>
<td>Read any characters not in the brackets up to the first matching character or whitespace.</td>
</tr>
<tr>
<td></td>
<td>Example: %[mus] reads 'summer' as 'summ'.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: %[^m] reads 'summer' as 'su'.</td>
<td></td>
</tr>
</tbody>
</table>
Optional Operators

- **Field Width** — To specify the maximum number of digits or text characters to read at a time, insert a number after the percent character. For example, `%10s` reads up to 10 characters at a time, including whitespace. `%4f` reads up to four digits at a time, including the decimal point.

- **Literal Text to Ignore** — This block must match the specified text immediately before or after the conversion specifier.

  Example: `Hello%s` reads "Hello!" as "o!".

Length Specifiers

The Scan String block supports the `h` and `l` length subspecifiers. These specifiers can change according to the **Configuration Parameters > Hardware Implementation > Number of bits** settings.

<table>
<thead>
<tr>
<th>Length</th>
<th>i</th>
<th>u</th>
<th>f e g</th>
<th>s c</th>
</tr>
</thead>
<tbody>
<tr>
<td>No length specifier</td>
<td>int</td>
<td>unsigned int</td>
<td>single</td>
<td>string</td>
</tr>
<tr>
<td>h</td>
<td>short</td>
<td>unsigned short</td>
<td>—</td>
<td>—</td>
</tr>
<tr>
<td>l</td>
<td>long</td>
<td>unsigned long</td>
<td>double</td>
<td>—</td>
</tr>
</tbody>
</table>

Notes for Specifiers that Specify Integer Data Types (`d, u`)

- Target `int`, `long`, `short` type sizes are controlled by settings in the **Configuration Parameters > Hardware Implementation** pane. For example, if the target `int` is 32 bits and the specifier is `%u`, then the expected input type will be `uint32`. For this example, the Scan String block requires that the output type be exactly `int32`. It cannot be any other data type.

String to Enum

Input string signal to enumerated signal

Library: Simulink / String

Description

The String To Enum block converts the input string signal to an enumerated signal. To use this block, create an enumeration class in the current folder and use that class name in the Output data type parameter.

Ports

Input

Port_1 — Input string signal
scalar

Input string signal, specified as a scalar.
Data Types: string

Output

Output 1 — Enumerated number
scalar

Enumerated number associated with the input string, specified as a scalar.
Data Types: enumerated
Parameters

Output data type — Output data type
SlDemoSign (default)|<data type expression>

Use a data type object, for example, Simulink.IntEnumType.

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. See “Specify Data Types Using Data Type Assistant” in the Simulink User's Guide for more information.

Mode — Category of data
Enumerated (default)|<data type expression>

Use a data type object, for example, Simulink.IntEnumType.

• Enumerated — Enumerated data class object.
• <data type expression> — Expressions that evaluate to data types. Selecting Expression enables a second menu/text box to the right, where you can enter the expression.

Dependency

Clicking the Show data type assistant button enables this parameter.

**Introduced in R2018a**
String to Single

Convert string signal to single signal

Library: Simulink / String

Description

Scan String scans an input string and converts it to signals per the format specified by the **Format** parameter. The block converts values to their decimal (base 10) representation and outputs the results as numeric or string signals. For example, if the **Format** parameter is set to "%s is %f.", the block outputs two parts, a string signal and a single signal. If the input is the string "Pi is 3.14", the two outputs are "Pi" and "3.14".

The Scan String, String to Double, and String to Single blocks are identical blocks. When configured for String to Double, the block converts the input string signal to a double numerical output. When configured for String to Single, the block converts the input string signal to a single numerical output.

For code generation, configure models that contain this block for non-finite number support by selecting the **Configuration Parameters > Code Generation > Interface > Support non-finite numbers** check box.

Ports

Input

**Port_1 — Input string**

scalar

Input string, specified as a scalar.

Data Types: string
Output

d — Output data whose format matches %d format
scalar

Output data whose format matches specified format, defined as a scalar. Total maximum number of outputs is 128.

If the block cannot match an input string to a format operator specified in Format, it returns a warning and outputs an appropriate value (0 or "") for each unmatched format operator.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

f — Output data whose format matches %f format
scalar

Output data whose format matches the %f format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port_N — Output data whose format matches N format
scalar

Output data whose format matches $N$ format, specified as a scalar. Total maximum number of outputs is 128.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Format — Format operator for input
"%f" (default) | scalar

Format operator for input, specified as a scalar. If the block cannot match the input string with the specified format, it returns 0. The return of 0 differs from the sscanf function return, which is an empty matrix if the function cannot match the input with the specified format.
For the String to Double block, this parameter has a default value of `%lf`.
For the String to Single block, this parameter has a default value of `%f`.

For more information about acceptable format operators, see the Algorithms section.

Introduced in R2018a
Substring

Extract substring from input string signal

**Library:** Simulink / String

**Description**

The Substring block extracts a substring from the input string signal. The block extracts the substring starting from the letter corresponding to `idx` and includes a `len` number of characters starting at `idx`. For example, if the input string is "hello 123", input `idx` is 1, and input `len` is 5, the output is "hello". The block extracts a substring starting at 1 and the next 4 characters for a total of 5 characters (hello).

**Ports**

**Input**

- **str** — Input string signal
  
scalar
  
Input string signal, specified as a string.
  
Data Types: `string`

- **idx** — Start of string to extract
  
scalar
  
Start of string to extract, specified as a positive scalar integer.
  
Data Types: `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32`

- **len** — Length of string to extract
  
scalar
Length of string to extract, specified as a scalar. If \textbf{len} causes the substring to extend beyond the end of the string, the output signal contains fewer than \textbf{len} characters.

Data Types: \texttt{uint8} | \texttt{uint16} | \texttt{uint32}

\textbf{Output}

\textit{sub — Extracted string}

\texttt{scalar}

Extracted string, specified as a scalar.

Data Types: \texttt{string}

\textbf{Parameters}

\texttt{Inherit maximum length from input — Use same maximum length as input string}

on (default) | off

Use same maximum length as the input string source block.

\checkmark on

Use same maximum length. The substring includes the characters starting from the character at \texttt{idx} to the end of the string.

\square off

Do not use same maximum length.

\texttt{Output string from 'idx' to end — Extract string from idx to end}

off (default) | on

Extract string from \texttt{idx} to end of input string.

\checkmark on

Extract string from \texttt{idx} to end of input string.

\square off

Do not extract string from \texttt{idx} to end of input string.
Dependencies

Selecting this parameter removes the third input port.

Introduced in R2018a
**Subsystem, Atomic Subsystem, CodeReuse Subsystem**

Group blocks to create model hierarchy

**Library:** Simulink / Ports & Subsystems

---

**Description**

A Subsystem block contains a subset of blocks within a model or system. The Subsystem block can represent a virtual subsystem or a nonvirtual subsystem.

- **Nonvirtual subsystem** – Control when the contents of the subsystem are evaluated as a single unit (atomic execution). Create conditionally executed subsystems that run only when an event occurs on a triggering, function-call, action, or enabling input (see “Conditionally Executed Subsystems and Models”).

- **Virtual subsystem** – Subsystem is neither conditionally nor atomically executed. Virtual subsystems do not have checksums. To determine if a subsystem is virtual, use the `get_param` function for the Boolean block parameter `IsSubsystemVirtual`.

An atomic subsystem is a Subsystem block with the block parameter `Treat as atomic unit` selected.

A codereuse subsystem is a Subsystem block with the parameter `Treat as atomic unit` selected and the parameter `Function packaging` set to `Reusable function`, specifying the function code generation format for the subsystem.

A referenced subsystem saves the content of a subsystem in a separate file and reference it using a Subsystem Reference block. To reuse that subsystem, add multiple Subsystem Reference blocks that reference that same subsystem file. A referenced subsystem behaves identical to a regular subsystem during run-time.

To create a subsystem, do one of the following:

- Copy a Subsystem block from the Ports & Subsystems library into your model. Then add blocks to the subsystem by opening the Subsystem block and copying blocks into it.
• Select all blocks and lines that make up the subsystem, and then in the Multiple tab, click Create Subsystem. Simulink replaces the blocks with a Subsystem block, along with the necessary Inport and Outport blocks to reflect signals entering and leaving the subsystem.

The number of input ports drawn on the Subsystem block icon corresponds to the number of Inport blocks in the subsystem. Similarly, the number of output ports drawn on the block corresponds to the number of Outport blocks in the subsystem.

The Subsystem block supports signal label propagation through subsystem Inport and Outport blocks.

### Ports

#### Input

**In — Signal input to a subsystem block**

| scalar | vector | matrix |

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

#### Output

**Out — Signal output from a subsystem**

| scalar | vector | matrix |

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus
Parameters

Parameters on the Code Generation tab require a Simulink Coder or Embedded Coder license.

**Content Preview — Display representation of block contents on the block**

'off' (default) | 'on'

Display a representation of block contents on the block. For more information, see “Preview Content of Model Components”.

**Programmatic Use**

**Parameter**: ContentPreviewEnabled

**Type**: character vector

**Value**: 'on' | 'off'

**Default**: 'on'

Main

**Show port labels — Select how to display port labels**

FromPortIcon (default) | FromPortBlockName | SignalName

Select how to display port labels on the Subsystem block icon.

none

Do not display port labels.

FromPortIcon

If the corresponding port icon displays a signal name, display the signal name on the Subsystem block. Otherwise, display the port block name.

FromPortBlockName

Display the name of the corresponding port block on the Subsystem block.

SignalName

If a signal name exists, display the name of the signal connected to the port on the Subsystem block. Otherwise, display the name of the corresponding port block.

**Programmatic Use**

**Parameter**: ShowPortLabels

**Type**: character vector
Value: 'FromPortIcon' | 'FromPortBlockName' | 'SignalName'
Default: 'FromPortIcon'

**Read/Write permissions — Select access to contents of subsystem**
ReadWrite (default) | ReadOnly | NoReadOrWrite

Control user access to the contents of the subsystem.

**ReadWrite**
Enable opening and modification of subsystem contents.

**ReadOnly**
Enable opening but not modification of the subsystem. If the subsystem resides in a block library, you can create and open links to the subsystem and can make and modify local copies of the subsystem but cannot change the permissions or modify the contents of the original library instance.

**NoReadOrWrite**
Disable opening or modification of subsystem. If the subsystem resides in a library, you can create links to the subsystem in a model but cannot open, modify, change permissions, or create local copies of the subsystem.

**Programmatic Use**
**Parameter:** Permissions
**Type:** character vector
**Value:** 'ReadWrite' | 'ReadOnly' | 'NoReadOrWrite'
**Default:** 'ReadWrite'

**Name of error callback function — Specify name of function**
' ' (default) | function name

Enter name of a function to be called if an error occurs while Simulink is executing the subsystem.

Simulink passes two arguments to the function: the handle of the subsystem and a character vector that specifies the error type. If no function is specified, Simulink displays a generic error message if executing the subsystem causes an error.

**Programmatic Use**
**Parameter:** ErrorFcn
**Type:** character vector
**Value:** '' | '<function name>'
Default: ''

Permit hierarchical resolution — Select how to resolve workspace variable names
All (default) | ExplicitOnly | None

Select whether to resolve names of workspace variables referenced by this subsystem.

All
- Resolve all names of workspace variables used by this subsystem, including those used to specify block parameter values and Simulink data objects (for example, Simulink.Signal objects).

ExplicitOnly
- Resolve only names of workspace variables used to specify block parameter values, data store memory (where no block exists), signals, and states marked as “must resolve”.

None
- Do not resolve any workspace variable names.

Programmatic Use
Parameter: PermitHierarchicalResolution
Type: character vector
Value: 'All' | 'ExplicitOnly' | 'None'
Default: 'All'

Treat as atomic unit — Control execution of a subsystem as one unit
off (default) | on

Causes Simulink to treat the subsystem as a unit when determining the execution order of block methods.

\[ \text{\square} \text{ off} \]

- Treat all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem when determining block method execution order. This can cause execution of methods of blocks in the subsystem to be interleaved with execution of methods of blocks outside the subsystem.
on

Treat the subsystem as a unit when determining the execution order of block methods. For example, when it needs to compute the output of the subsystem, Simulink invokes the output methods of all the blocks in the subsystem before invoking the output methods of other blocks at the same level as the subsystem block.

**Dependency**

Selecting this parameter enables the **Minimize algebraic loop occurrences**, **Sample time**, **Schedule As** and **Function packaging** parameters. Using **Function packaging** requires a Simulink Coder license.

**Programmatic Use**

- **Parameter**: TreatAsAtomicUnit
- **Type**: character vector
- **Value**: 'off' | 'on'
- **Default**: 'off'

**Minimize algebraic loop occurrences — Control elimination of algebraic loops**

- **off** (default) | **on**

Try to eliminate any artificial algebraic loops that include the atomic subsystem.

- **off**

Do not try to eliminate any artificial algebraic loops that include the atomic subsystem.

- **on**

Try to eliminate any artificial algebraic loops that include the atomic subsystem.

**Dependency**

To enable this parameter, select the **Treat as atomic unit** parameter.

**Programmatic Use**

- **Parameter**: MinAlgLoopOccurrences
- **Type**: character vector
- **Value**: 'off' | 'on'
- **Default**: 'off'
**Schedule As — Specify type of scheduling**

Sample Time (default) | Periodic Partition | Aperiodic Partition

Specify how to schedule the subsystem.

**Sample time**

Specify whether all blocks in this subsystem must run at the same rate or can run at different rates.

**Periodic Partition**

Schedule the subsystem as a periodic partition. Specify a partition name and a sample time corresponding to the rate at which the partition runs.

**Aperiodic Partition**

Schedule the subsystem as an aperiodic partition. Specify a partition name.

**Dependency**

To enable this parameter, select the **Treat as atomic unit** parameter.

**Programmatic Use**

**Parameter:** ScheduleAs  
**Type:** character vector  
**Value:** 'SampleTime' | 'DiscretePartition' | 'UnconstrainedPartition'  
**Default:** 'SampleTime'

**Partition Name — Specify name of the partition**

**Character Vector**

Specify name of the partition for the subsystem.

**Dependency**

To enable this parameter, select the **Treat as atomic unit** parameter, and **Schedule As** to be Discrete Partition or Unconstrained partition.

**Programmatic Use**

**Parameter:** PartitionName  
**Type:** character vector  
**Value:** character vector  
**Default:** character vector

**Sample time — Specify time interval**

-1 (default) | [Ts 0]
Specify whether all blocks in this subsystem must run at the same rate or can run at different rates.

- If the blocks in the subsystem can run at different rates, specify the subsystem's sample time as inherited (-1).
- If all blocks must run at the same rate, specify the sample time corresponding to this rate as the value of the Sample time parameter.
- If any of the blocks in the subsystem specify a different sample time (other than -1 or inf), Simulink displays an error message when you update or simulate the model. For example, suppose all the blocks in the subsystem must run 5 times a second. To ensure this, specify the sample time of the subsystem as 0.2. In this example, if any of the blocks in the subsystem specify a sample time other than 0.2, -1, or inf, Simulink displays an error when you update or simulate the model.

-1
   Specify inherited sample time. Use this sample time if the blocks in the subsystem can run at different rates.

[Ts 0]
   Specify periodic sample time.

**Dependency**

To enable this parameter, select the Treat as atomic unit parameter.

**Programmatic Use**

Parameter: SystemSampleTime
Type: character vector
Value: '-1' | '[Ts 0]'
Default: '-1'

**Propagate execution context across subsystem boundary — Control execution across block boundary**

off (default) | on

Enable execution context propagation across the boundary of this subsystem.

off

Do not enable execution context propagation across this subsystem's boundary.
on

Enable execution context propagation across this subsystem's boundary.

**Dependency**

Enable this parameter by adding an Enable port or Trigger port block to the Subsystem block.

**Programmatic Use**

**Parameter:** PropExecContextOutsideSubsystem  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'off'

**Variant control — Specify variant control (condition) expression**

Variant (default) | logical expression

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to true.

See also `Simulink.Variant`

**Variant**

Default name for a logical (Boolean) expression.

**logical expression**

A logical (Boolean) expression or a `Simulink.Variant` object representing a logical expression.

The function is activated when the expression evaluates to true.

If you want to generate code for your model, define the variables in the expression as `Simulink.Parameter` objects.

**Dependency**

Enable this parameter by adding a Subsystem block inside a Variant Subsystem block.

**Programmatic Use**

**Block parameter:** VariantControl  
**Type:** character vector  
**Value:** 'Variant' | '<logical expression>'
Default: 'Variant'

**Treat as grouped when propagating variant conditions — Control treating subsystem as unit**

*on* (default) | *off*

Causes Simulink to treat the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks.

- **on**
  - Simulink treats the subsystem as a unit when propagating variant conditions from Variant Source blocks or to Variant Sink blocks. For example, when Simulink computes the variant condition of the subsystem, it propagates that condition to all the blocks in the subsystem.

- **off**
  - Simulink treats all blocks in the subsystem as being at the same level in the model hierarchy as the subsystem itself when determining their variant condition.

**Programmatic Use**

**Parameter:** TreatAsGroupedWhenPropagatingVariantConditions

**Type:** character vector  
**Value:** 'on' | 'off'

**Default:** 'on'

**Code Generation**

**Function packaging — Select code format**

*Auto* (default) | *Inline* | *Nonreusable function* | *Reusable function*

Select the code format to be generated for an atomic (nonvirtual) subsystem.

- **Auto**
  - Simulink Coder and Embedded Coder choose the optimal format for you based on the type and number of instances of the subsystem that exist in the model.

- **Inline**
  - Simulink Coder and Embedded Coder inline the subsystem unconditionally.

- **Nonreusable function**
  - If **Filename options** is set to *Auto*, Simulink Coder and Embedded Coder package separate functions in the model file. If **File name options** is set to **Use subsystem**
name, Use function name, or User specified using different file names, Simulink Coder and Embedded Coder package separate functions in separate files.

Subsystems with this setting generate functions that might have arguments depending on the “Function interface” on page 1-0 parameter setting. You can name the generated function and file using parameters “Function name” on page 1-0 and “File name (no extension)” on page 1-0. These functions are not reentrant.

Reusable function

Simulink Coder and Embedded Coder generate a function with arguments that allows reuse of subsystem code when a model includes multiple instances of the subsystem.

This option also generates a function with arguments that allows subsystem code to be reused in the generated code of a model reference hierarchy that includes multiple instances of a subsystem across referenced models. In this case, the subsystem must be in a library.

**Tips**

- When you want multiple instances of a subsystem to be represented as one reusable function, you can designate each one of them as Auto or as Reusable function. It is best to use one or the other, as using both creates two reusable functions, one for each designation. The outcomes of these choices differ only when reuse is not possible. Selecting Auto does not allow control of the function or file name for the subsystem code.

- The Reusable function and Auto options both try to determine if multiple instances of a subsystem exist and if the code can be reused. The difference between the options' behavior is that when reuse is not possible:
  
  - Auto yields inlined code, or if circumstances prohibit inlining, separate functions for each subsystem instance.
  - Reusable function yields a separate function with arguments for each subsystem instance in the model.

- If you select Reusable function while your generated code is under source control, set **File name options** to **Use subsystem name**, **Use function name**, or **User specified**. Otherwise, the names of your code files change whenever you modify your model, which prevents source control on your files.
Dependency

- This parameter requires Simulink Coder for code generation.
- To enable this parameter, select **Treat as atomic unit**.
- Setting this parameter to **Nonreusable function** or **Reusable function** enables the following parameters:
  - **Function name options**
  - **File name options**
  - Memory section for initialize/terminate functions (requires a license for Embedded Coder and an ERT-based system target file)
  - Memory section for execution functions (requires a license for Embedded Coder and an ERT-based system target file)
- Setting this parameter to **Nonreusable function** enables **Function with separate data** (requires a license for Embedded Coder and an ERT-based system target file).

Programmatic Use

**Parameter:** RTWSystemCode  
**Type:** character vector  
**Value:** 'Auto' | 'Inline' | 'Nonreusable function' | 'Reusable function'  
**Default:** 'Auto'

**Function name options — Select how to name generated function**

Auto (default) | Use subsystem name | User specified

Select how Simulink Coder names the function it generates for the subsystem.
If you have an Embedded Coder license, you can control function names with options on the Configuration Parameter **Code Generation > Identifiers** pane.

**Auto**

Assign a unique function name using the default naming convention, `model_subsystem()`, where `model` is the name of the model and `subsystem` is the name of the subsystem (or that of an identical one when code is being reused).

If you select **Reusable function** for the **Function packaging** parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, **Function name options** must be set to **Auto**.

**Use subsystem name**

Use the subsystem name as the function name. By default, the function name uses the naming convention `model_subsystem`.

**Note** When a subsystem is in a library block and the subsystem parameter “Function packaging” on page 1-0 is set to **Reusable function**, if you set the **Use subsystem name** option, the code generator uses the name of the library block for the subsystem's function name and file name.

**User specified**

Enable the **Function name** field. Enter any legal C or C++ function name, which must be unique.

**Dependency**

- This parameter requires a Simulink Coder license.
- Setting Code generation function packaging to **Nonreusable function** or **Reusable function** enables this parameter.
- Setting this parameter to **User specified** enables the Code generation function name parameter.

**Programmatic Use**

**Parameter:** RTWFcnNameOpts  
**Type:** character vector  
**Value:** 'Auto' | 'Use subsystem name' | 'User specified'  
**Default:** 'Auto'
See also

For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

**Function name — Specify function name**

```
'' (default) | function name
```

Specify a unique, valid C or C++ function name for subsystem code.

Use this parameter if you want to give the function a specific name instead of allowing the Simulink Coder code generator to assign its own autogenerated name or use the subsystem name. For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

**Dependency**

- This parameter requires a Simulink Coder license.
- To enable this parameter, set the **Function name options** parameter to **User specified**.

**Programmatic Use**

Parameter: RTWFcnName  
Type: character vector  
Value: '' | '<function name>'  
Default: ''

**File name options — Specify how to name generated file**

Auto (default) | Use subsystem name | Use function name | User specified

Select how Simulink Coder names the separate file for the function it generates for the subsystem.

See “Block-Specific Parameters” on page 6-132 for the command-line information.

**Auto**

Depending on the configuration of the subsystem and how many instances are in the model, **Auto** yields different results:

- If the code generator does not generate a separate file for the subsystem, the subsystem code is generated within the code module generated from the subsystem's parent system. If the subsystem's parent is the model itself, the subsystem code is generated within *model.c* or *model.cpp*. 
• If you select Reusable function for the Function packaging parameter and your generated code is under source control, consider specifying a File name options value other than Auto. This prevents the generated file name from changing due to unrelated model modifications, which is problematic for using source control to manage configurations.

• If you select Reusable function for the Function packaging parameter and there are multiple instances of the reusable subsystem in a model reference hierarchy, in order to generate reusable code for the subsystem, File name options must be set to Auto.

Use subsystem name
The code generator generates a separate file, using the subsystem (or library block) name as the file name.

Note When File name options is set to Use subsystem name, the subsystem file name is mangled if the model contains Model blocks, or if a model reference target is being generated for the model. In these situations, the file name for the subsystem consists of the subsystem name prefixed by the model name.

Use function name
The code generator uses the function name specified by Function name options as the file name.

User specified
This option enables the File name (no extension) text entry field. The code generator uses the name you enter as the file name. Enter any file name, but do not include the .c or .cpp (or any other) extension. This file name need not be unique.

Note While a subsystem source file name need not be unique, you must avoid giving nonunique names that result in cyclic dependencies (for example, sys_a.h includes sys_b.h, sys_b.h includes sys_c.h, and sys_c.h includes sys_a.h).

Dependency
• This parameter requires a Simulink Coder license.
• To enable this parameter, set Function packaging to Nonreusable function or Reusable function.
• Setting this parameter to User specified enables the File name (no extension) parameter.

**Programmatic Use**
**Parameter:** RTWFileNameOpts  
**Type:** character vector  
**Value:** 'Auto' | 'Use subsystem name' | 'Use function name' | 'User specified'  
**Default:** 'Auto'

**File name (no extension) — Specify file name**
' ' (default) | file name

The file name that you specify does not have to be unique. However, avoid giving non-unique names that result in cyclic dependencies (for example, `sys_a.h` includes `sys_b.h`, `sys_b.h` includes `sys_c.h`, and `sys_c.h` includes `sys_a.h`).

For more information, see “Control Generation of Functions for Subsystems” (Simulink Coder).

**Dependency**

• This parameter requires a Simulink Coder license.
• To enable this parameter, set File name options to User specified.

**Programmatic Use**
**Parameter:** RTWFileName  
**Type:** character vector  
**Value:** ' ' | '<file name>'  
**Default:** '

**Function with separate data — Control code generation for subsystem**
off (default) | on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.

on

Do not generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem.
on

Generate subsystem function code in which the internal data for an atomic subsystem is separated from its parent model and is owned by the subsystem. The subsystem data structure is declared independently from the parent model data structures. A subsystem with separate data has its own block I/O and DWork data structure. As a result, the generated code for the subsystem is easier to trace and test. The data separation also tends to reduce the maximum size of global data structures throughout the model, because they are split into multiple data structures.

Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set Function packaging to Nonreusable function.
- Selecting this parameter enables these parameters:
  - Memory section for constants
  - Memory section for internal data
  - Memory section for parameters

Programmatic Use

Parameter: FunctionWithSeparateData
Type: character vector
Value: 'off' | 'on'
Default: 'off'

See also

- See the Subsystem block reference page for more information.
- For details on how to generate modular function code for an atomic subsystem, see “Generate Modular Function Code for Nonvirtual Subsystems” (Embedded Coder).
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Function interface — Select to use arguments with generate function

void_void (default) | Allow arguments

Select to use arguments with generated function.
Generate a function without arguments and pass data as global variables. For example:

```c
void subsystem_function(void)
```

**Allow arguments**

Generate a function that uses arguments instead of passing data as global variables. This specification reduces global RAM. It might reduce code size and improve execution speed, and allow the code generator to apply additional optimizations. For example:

```c
void subsystem_function(real_T rtu_In1, real_T rtu_In2, real_T *rty_Out1)
```

**Dependency**

- This parameter requires an Embedded Coder license and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to **Nonreusable function**.

**Programmatic Use**

**Parameter:** FunctionInterfaceSpec  
**Type:** character vector  
**Value:** 'void_void' | 'Allow arguments'  
**Default:** 'void_void'

**See also**

- “Reduce Global Variables in Nonreusable Subsystem Functions” (Embedded Coder)  
- “Generate Modular Function Code for Nonvirtual Subsystems” (Embedded Coder)

**Memory section for initialize/terminate functions — Select how to apply memory sections**

**Inherit from model (default)**  
**Default**  
**The memory section of interest**

Select how Embedded Coder applies memory sections to the subsystem initialization and termination functions.

**Inherit from model**

- Apply the root model's memory sections to the subsystem's function code
Default
Do not apply memory sections to the subsystem's system code, overriding any model-level specification

The memory section of interest
Apply one of the model's memory sections to the subsystem

Tips
• The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).
• If you have not configured the model with a package, Inherit from model is the only value that appears. Otherwise, the list includes Default and all memory sections the model's package contains.
• These options can be useful for overriding the model's memory section settings for the given subsystem.

Dependency
• This parameter requires a license for Embedded Coder software and an ERT-based system target file.
• To enable this parameter, set Function packaging to Nonreusable function or Reusable function.

Programmatic Use
Parameter: RTWMemSecFuncInitTerm
Type: character vector
Value: 'Inherit from model' | 'Default' | 'The memory section of interest'
Default: 'Inherit from model'

See also
• See the Subsystem block reference page for more information.
• For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Memory section for execution functions — Select how to apply memory sections
Inherit from model (default) | Default | The memory section of interest
Select how Embedded Coder applies memory sections to the subsystem's execution functions.

**Inherit from model**
- Apply the root model's memory sections to the subsystem's function code

**Default**
- Do not apply memory sections to the subsystem system code, overriding any model-level specification

**The memory section of interest**
- Apply one of the model's memory sections to the subsystem

**Tips**
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder) and “Model Configuration Parameters: Code Generation” (Simulink Coder).
- If you have not configured the model with a package, Inherit from model is the only value that appears. Otherwise, the list includes Default and all memory sections the model's package contains.
- These options can be useful for overriding the model's memory section settings for the given subsystem.

**Dependency**
- This parameter requires a license for Embedded Coder software and an ERT-based system target file.
- To enable this parameter, set **Function packaging** to Nonreusable function or Reusable function.

**Programmatic Use**
- **Parameter**: RTWMemSecFuncExecute
- **Type**: character vector
- **Value**: 'Inherit from model' | 'Default' | 'The memory section of interest'
- **Default**: 'Inherit from model'

**See also**
- See the Subsystem block reference page for more information.
For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

**Memory section for constants — Select how to apply memory sections**

- Inherit from model (default)
- Default
- The memory section of interest

Select how Embedded Coder applies memory sections to the subsystem constants.

**Inherit from model**

- Apply the root model's memory sections to the subsystem's data

**Default**

- Not apply memory sections to the subsystem's data, overriding any model-level specification

**The memory section of interest**

- Apply one of the model's memory sections to the subsystem

**Tips**

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, Inherit from model is the only value that appears. Otherwise, the list includes Default and all memory sections the model's package contains.

**Dependency**

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set Function packaging to Nonreusable function and select the Function with separate data parameter
**Programmatic Use**

**Parameter:** RTWMemSecDataConstants  
**Type:** character vector  
**Value:** 'Inherit from model' | 'Default' | 'The memory section of interest'  
**Default:** 'Inherit from model'

**See also**

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

**Memory section for internal data — Select how to apply memory sections**

Select how Embedded Coder applies memory sections to the subsystem internal data.

- **Inherit from model**  
  Apply the root model's memory sections to the subsystem's data

- **Default**  
  Not apply memory sections to the subsystem's data, overriding any model-level specification

- **The memory section of interest**  
  Apply one of the model's memory sections to the subsystem

**Tips**

- The memory section that you specify applies to the corresponding global data structures in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
- The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).
- If you have not configured the model with a package, Inherit from model is the only value that appears. Otherwise, the list includes Default and all memory sections the model's package contains.
Dependency

- This parameter requires a license for Embedded Coder and an ERT-based system target file.
- To enable this parameter, set Function packaging to Nonreusable function and select the Function with separate data parameter.

Programmatic Use
Parameter: RTWMemSecDataInternal
Type: character vector
Value: 'Inherit from model' | 'Default' | 'The memory section of interest'
Default: 'Inherit from model'

See also

- See the Subsystem block reference page for more information.
- For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Memory section for parameters — Select how to apply memory sections

Inherit from model (default) | Default | The memory section of interest

Select how Embedded Coder applies memory sections to the subsystem parameters.

Inherit from model
- Apply the root model's memory sections to the subsystem's function code

Default
- Not apply memory sections to the subsystem's system code, overriding any model-level specification

The memory section of interest
- Apply one of the model's memory sections to the subsystem

Tips

- The memory section that you specify applies to the corresponding global data structure in the generated code. For basic information about the global data structures generated for atomic subsystems, see “Standard Data Structures in the Generated Code” (Simulink Coder).
- Can be useful for overriding the model's memory section settings for the given subsystem.
• The possible values vary depending on what (if any) package of memory sections you have set for the model's configuration. See “Control Data and Function Placement in Memory by Inserting Pragmas” (Embedded Coder).

• If you have not configured the model with a package, Inherit from model is the only value that appears. Otherwise, the list includes Default and all memory sections the model's package contains.

Dependency

• This parameter requires a license for Embedded Coder and an ERT-based system target file.

• To enable this parameter, set Function packaging to Nonreusable function and select the Function with separate data parameter.

Programmatic Use
Parameter: RTWMemSecDataParameters
Type: character vector
Value: 'Inherit from model' | 'Default' | 'The memory section of interest'
Default: 'Inherit from model'

• See the Subsystem block reference page for more information.

• For details on how to apply memory sections to atomic subsystems, see “Override Default Memory Placement for Subsystem Functions and Data” (Embedded Coder).

Subsystem Reference

Convert to Subsystem Reference — Save a subsystem in a separate file
string | character vector

The Referenced subsystem parameter helps you to convert a Subsystem block to a referenced subsystem.

For more information on how to convert a subsystem to a referenced subsystem, see “Convert an Existing Subsystem to a Referenced Subsystem”.

</tr>
</tbody>
</table>
Architecture | Description
--- | ---
BlackBox | Generate a black box interface. The generated HDL code includes only the input/output port definitions for the subsystem. Therefore, you can use a subsystem in your model to generate an interface to existing, manually written HDL code.

The black-box interface generation for subsystems is similar to the Model block interface generation without the clock signals.

No HDL | Remove the subsystem from the generated code. You can use the subsystem in simulation, however, treat it as a “no-op” in the HDL code.

**Black Box Interface Customization**

For the BlackBox architecture, you can customize port names and set attributes of the external component interface. See “Customize Black Box or HDL Cosimulation Interface” (HDL Coder).

If this block is not the DUT, the block property settings in the Target Specification tab are ignored. In the HDL Workflow Advisor, if you use the IP Core Generation workflow, these target specification block property values are saved with the model. If you specify these target specification block property values using hdlset_param, when you open HDL Workflow Advisor, the fields are populated with the corresponding values.

### Target Specification

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **GenerateDefaultAXI4Slave** | To save this block property on the model, specify whether you want to disable generation of default AXI4 slave interfaces in the Generate RTL Code and IP Core task of the IP Core Generation workflow.  
Values: 'on' (default) | 'off'                                                                                                                                         |
| **IPCoreAdditionalFiles**  | Verilog or VHDL files for black boxes in your design. Specify the full path to each file, and separate file names with a semicolon (;).  
You can set this property in the HDL Workflow Advisor, in the Additional source files field.  
Values: ' ' (default) | character vector                                                                                                                              |
| **IPCoreName**             | IP core name, specified as a character vector.  
You can set this property in the HDL Workflow Advisor, in the IP core name field. If this property is set to the default value, the HDL Workflow Advisor constructs the IP core name based on the name of the DUT.  
Values: ' ' (default) | character vector                                                                                                                              |
| **IPCoreVersion**          | IP core version number, specified as a character vector.  
You can set this property in the HDL Workflow Advisor, in the IP core version field. If this property is set to the default value, the HDL Workflow Advisor sets the IP core version.  
Values: ' ' (default) | character vector                                                                                                                              |

**Example:**

- 'C:\myprojfiles\led_blinking_file1.vhd;C:\myprojfiles\led_blinking_file2.vhd;'
Restrictions

If your DUT is a masked subsystem, you can generate code only if it is at the top level of the model.

For more information, see:

- “External Component Interfaces” (HDL Coder)
- “Generate Black Box Interface for Subsystem” (HDL Coder)

PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Introduced in R2007a
Add, Subtract, Sum of Elements, Sum

Add or subtract inputs

Library:
- Simulink / Math Operations
- HDL Coder / HDL Floating Point Operations
- HDL Coder / Math Operations

Description

The Sum block performs addition or subtraction on its inputs. The Add, Subtract, Sum of Elements, and Sum blocks are identical blocks. This block can add or subtract scalar, vector, or matrix inputs. It can also collapse the elements of a signal and perform a summation.

You specify the operations of the block with the List of signs parameter with plus (+), minus (-), and spacer (|).

- The number of + and - characters equals the number of inputs. For example, +++ requires three inputs. The block subtracts the second (middle) input from the first (top) input, and then adds the third (bottom) input.
- A spacer character creates extra space between ports on the block icon.
- If performing only addition, you can use a numerical value equal to the number of inputs.
- If only there is only one input port, a single + or - adds or subtracts the elements over all dimensions or in the specified dimension.

The Sum block first converts the input data type to its accumulator data type, then performs the specified operations. The block converts the result to its output data type using the specified rounding and overflow modes.

Calculation of Block Output

Output calculation for the Sum block depends on the number of block inputs and the sign of input ports:
If the Sum block has...

<table>
<thead>
<tr>
<th>And...</th>
<th>The formula for output calculation is...</th>
<th>Where...</th>
</tr>
</thead>
<tbody>
<tr>
<td>One input port</td>
<td>The input port sign is +</td>
<td>( y = e[0] + e[1] + e[2] \ldots + e[m] )</td>
</tr>
<tr>
<td></td>
<td>The input port sign is -</td>
<td>( y = 0.0 - e[0] - e[1] - e[2] \ldots - e[m] )</td>
</tr>
<tr>
<td>Two or more input ports</td>
<td>All input port signs are -</td>
<td>( y = 0.0 - u[0] - u[1] - u[2] \ldots - u[n] )</td>
</tr>
<tr>
<td></td>
<td>The ( k^{th} ) input port is the first port where the sign is +</td>
<td>( y = u[k] - u[0] - u[1] - u[2] - u[k-1] (+/-) u[k+1] \ldots (+/-) u[n] )</td>
</tr>
</tbody>
</table>

### Ports

### Inputs

The inputs can be of different data types, unless you select the **Require all inputs to have the same data type** parameter.

**Port_1 — First input operand signal**

**scalar | vector | matrix**

Input signal to the addition or subtraction operation. If there is only one input signal, then addition or subtraction is performed on the elements over all dimensions or the specified dimension.

Data Types: **single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point**

**Port_n — nth input operand signal**

**scalar | vector | matrix**

nth input signal to the operations. The number of inputs matches the number of signs in the **List of signs** parameter. The block applies the operations to the inputs in the order...
listed. You can also use a numerical value equal to the number of input ports as the **List of signs** parameter. The block creates the input ports and applies addition to all inputs. For example, if you assign 5 for the **List of signs** parameter, the block creates 5 input ports and adds them together to produce the output.

All nonscalar inputs must have the same dimensions. Scalar inputs are expanded to have the same dimensions as other inputs.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**Port_1 — Output signal**

scalar | vector | matrix

Output signal resulting from addition and/or subtraction operations. The output signal has the same dimension as the input signals.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Parameters**

**Main**

**Icon shape — Block icon shape**

rectangular (default) | round

Designate the icon shape of the block as rectangular or round.

For a rectangular block, the first input port is the top port. For a round Sum block, the first input port is the port closest to the 12 o'clock position going in a counterclockwise direction around the block. Similarly, other input ports appear in counterclockwise order around the block.

**Programmatic Use**

**Block Parameter:** IconShape

**Type:** character vector

**Values:** 'rectangular' | 'round'
**List of signs — Operations performed on inputs**

Enter addition and subtraction operations performed on the inputs. An input port is created for each operation. A spacer (|) creates extra space between the input ports on the block icon. Addition is the default operation. If you only want to add the inputs, enter the number of input ports. The operations are performed in the order listed.

When you enter only one element, the block enables the **Sum over** parameter. For a single vector input, + or - adds or subtracts the elements over all dimensions or in the specified dimension.

**Tips**

You can manipulate the positions of the input ports on the block by inserting spacers (|) between the signs in the **List of signs** parameter. For example, “++|--” creates an extra space between the second and third input ports.

**Programmatic Use**

**Block Parameter:** Inputs

**Type:** character vector

**Values:** '+ | - | | | integer

**Default:** '++'

**Sum over — Dimensions for operations on a single vector input**

**All dimensions** (default) | **Specified dimension**

Select the dimension over which the block performs the sum-over operation.

For **All dimensions**, all input elements are summed. When you select configuration parameter **Use algorithms optimized for row-major array layout**, Simulink enables row-major algorithms for simulation. To generate row-major code, set configuration parameter **Array layout** (Simulink Coder) to **Row-major** in addition to selecting **Use algorithms optimized for row-major array layout**. The column-major and row-major algorithms differ only in the summation order. In some cases, due to different operation order on the same data set, you might experience minor numeric differences in the outputs of column-major and row-major algorithms.

When you select **Specified dimensions**, another parameter **Dimension** appears. Choose the specific dimension for summing the vector input.
Dependency

Enabled when you list only one sign in the List of signs parameter.

Programmatic Use

Block Parameter: CollapseMode
Type: character vector
Values: 'All dimensions' | 'Specified dimension'
Default: 'All dimensions'

Dimension — Dimension for summation on vector input
1 (default) | integer

When you choose Specified dimension for the Sum over parameter, specify the dimension over which to perform the operation.

The block follows the same summation rules as the MATLAB sum function.

Suppose that you have a 2-by-3 matrix $U$.

• Setting Dimension to 1 results in the output $Y$ being computed as:

$$ Y = \sum_{i=1}^{2} U(i, j) $$

• Setting Dimension to 2 results in the output $Y$ being computed as:

$$ Y = \sum_{j=1}^{3} U(i, j) $$

If the specified dimension is greater than the dimension of the input, an error message appears.

Dependency

Enabled when you choose Specified dimension for the Sum over parameter.

Programmatic Use

Block Parameter: CollapseDim
Type: character vector
Value: integer
Default: '1'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar | vector
Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

**Programmatic Use**

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar or vector  
**Default:** '-1'

**Signal Attributes**

Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Require all inputs to have the same data type — Require that all inputs have the same data type**

off (default) | on

Specify if input signals must all have the same data type. If you enable this parameter, then an error occurs during simulation if the input signal types are different.

**Programmatic Use**

**Block Parameter:** InputSameDT  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Accumulator data type — Data type of the accumulator**

Inherit: Inherit via internal rule (default) | Inherit: Same as first input | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type of the accumulator. The type can be inherited, specified directly, or expressed as a data type object such as `Simulink.NumericType`. When you choose
Inherit: Inherit via internal rule, Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.

**Programmatic Use**
**Block Parameter:** AccumDataTypeStr  
**Type:** character vector  
**Values:** 'Inherit: Inherit via internal rule'| 'Inherit: Same as first input' | 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'  
**Default:** 'Inherit: Inherit via internal rule'

**Output minimum — Minimum output value for range checking**
[] (default) | scalar  

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**
**Block Parameter:** OutMin  
**Type:** character vector  
**Values:** '[]' | scalar  
**Default:** '[]'
**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMax

**Type:** character vector

**Values:** '[]' | scalar

**Default:** '[]'

**Output data type — Specify the output data type**

Inherit: Inherit via internal rule (default) | Inherit: Keep MSB | Inherit: Keep LSB | Inherit: Inherit via back propagation | Inherit: Same as first input | Inherit: Same as accumulator | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | <data type expression>

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

When you select an inherited option, the block behaves as follows:
• **Inherit: Inherit via internal rule**—Simulink chooses a data type to balance numerical accuracy, performance, and generated code size, while taking into account the properties of the embedded target hardware.

**Note** The accumulator internal rule favors greater numerical accuracy, possibly at the cost of less efficient generated code. To get the same accuracy for the output, set the output data type to **Inherit: Inherit same as accumulator**.

• **Inherit: Keep MSB**—Simulink chooses a data type that maintains the full range of the operation, then reduces the precision of the output to a size appropriate for the embedded target hardware.

**Tip** For more efficient generated code, set the **Accumulator data type** to **Inherit: Inherit via internal rule**, and deselect the **Saturate on integer overflow** parameter.

This rule never produces overflows.

• **Inherit: Keep LSB**—Simulink chooses a data type that maintains the precision of the operation, but reduces the range if the full type does not fit on the embedded target hardware.

**Tip** For more efficient generated code, set the **Accumulator data type** to **Inherit: Inherit via internal rule**, and deselect the **Saturate on integer overflow** parameter.

This rule can produce overflows.

If you change the embedded target settings, the data type selected by these internal rules might change. It is not always possible for the software to optimize code efficiency and numerical accuracy at the same time. If the rules do not meet your specific needs for numerical accuracy or performance, use one of the following options:

• Specify the output data type explicitly.
• Use the simple choice of **Inherit: Same as first input**.
• Explicitly specify a default data type such as `fixpt(1,32,16)` and then use the Fixed-Point Tool to propose data types for your model. For more information, see `fxptdlg`.

• To specify your own inheritance rule, use `Inherit: Inherit via back propagation` and then use a Data Type Propagation block. Examples of how to use this block are available in the Signal Attributes library Data Type Propagation Examples block.

• `Inherit: Inherit via back propagation` — Use data type of the driving block.

• `Inherit: Same as first input` — Use data type of the first input signal.

• `Inherit: Inherit same as accumulator` — Use data type of the accumulator.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr
**Type:** character vector

**Values:**
- `'Inherit: Inherit via internal rule'`
- `'Inherit: Keep MSB'`
- `'Inherit: Keep LSB'`
- `'Inherit: Inherit via back propagation'`
- `'Inherit: Same as first input'`
- `'Inherit: Same as accumulator'`
- `'double'`
- `'single'`
- `'int8'`
- `'uint8'`
- `'int16'`
- `'uint16'`
- `'int32'`
- `'uint32'`
- `'int64'`
- `'uint64'`
- `'fixpt(1,16)'`
- `'fixpt(1,16,2^0,0)'`
- `<data type expression>`

**Default:** `'Inherit: Inherit via internal rule'`

**Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types**

**off** (default) | **on**

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

**Programmatic Use**

**Block Parameter:** LockScale

**Values:**
- `'off'`
- `'on'`

**Default:** `'off'`

**Integer rounding mode — Rounding mode for fixed-point operations**

**Floor** (default) | **Ceiling** | **Convergent** | **Nearest** | **Round** | **Simplest** | **Zero**

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).
Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

**Programmatic Use**

**Block Parameter:** RndMeth

**Type:** character vector

**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'

**Default:** 'Floor'

**Saturate on integer overflow — Method of overflow action**

off (default) | on

Specify whether overflows saturate or wrap.

<table>
<thead>
<tr>
<th>Action</th>
<th>Rationale</th>
<th>Impact on Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box (on).</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Action</td>
<td>Rationale</td>
<td>Impact on Overflows</td>
<td>Example</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Do not select this check box</td>
<td>You want to optimize efficiency of your generated code.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
<tr>
<td>(off)</td>
<td>You want to avoid overspecifying how a block handles out-of-range signals.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

**Programmatic Use**

**Block Parameter:** SaturateOnIntegerOverflow  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Block Characteristics**

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

### HDL Code Generation

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

#### HDL Architecture of Sum, Add, and Subtract Blocks

The default Linear architecture generates a chain of N operations (adders) for N inputs.

#### HDL Architecture of Sum of Elements Block

For the Sum of Elements block, HDL Coder supports Tree and Cascade architectures for Sum of Elements blocks that have a single vector input with multiple elements.

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Additional cycles of latency</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>0</td>
<td>Generates a linear chain of adders to compute the sum of products.</td>

<tr>
<td><strong>OutputPipeline</strong></td>
<td>Number of output pipeline stages to insert in the generated code. Distributed pipelining and constrained output pipelining can move these registers. The default is 0. For more details, see “OutputPipeline” (HDL Coder).</td>
</tr>
</tbody>
</table>

**Note** The Sum of Elements block does not support HDL code generation with double data types in the Native Floating Point mode.

1-2071
### Native Floating Point

<table>
<thead>
<tr>
<th>LatencyStrategy</th>
<th>Specify whether to map the blocks in your design to inherit, Max, Min, Zero, or Custom for the floating-point operator. The default is inherit. See also “LatencyStrategy” (HDL Coder).</th>
</tr>
</thead>
<tbody>
<tr>
<td>NFPCustomLatency</td>
<td>To specify a value, set LatencyStrategy to Custom. HDL Coder adds latency equal to the value that you specify for the NFPCustomLatency setting. See also “NFPCustomLatency” (HDL Coder).</td>
</tr>
</tbody>
</table>

### Complex Data Support

The default Linear implementation supports complex data.

The Tree implementation supports complex data with + for the List of signs block parameter. With native floating point support, the Tree implementation supports complex data with both + and - for List of signs.

### PLC Code Generation

Generate Structured Text code using Simulink® PLC Coder™.

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

Bias | Divide | Gain

### Topics

“Control Signal Data Types”

### Introduced before R2006a
Switch

Combine multiple signals into single signal

Library:
- Simulink / Commonly Used Blocks
- Simulink / Signal Routing
- HDL Coder / Commonly Used Blocks
- HDL Coder / Signal Routing

Description

The Switch block passes through the first input or the third input signal based on the value of the second input. The first and third inputs are data input. The second input is a control input. Specify the condition under which the block passes the first input by using the Criteria for passing first input and Threshold parameters.

Bus Support

The Switch block is a bus-capable block. The data inputs can be virtual or nonvirtual bus signals subject to the following restrictions:

- All the buses must be equivalent (same hierarchy with identical names and attributes for all elements).
- All signals in a nonvirtual bus input to a Switch block must have the same sample time. The requirement holds even if the elements of the associated bus object specify inherited sample times.

You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Specify Bus Signal Sample Times” and Bus-Capable Blocks for more information.

You can use an array of buses as an input signal to a Switch block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”. When using an array of buses, set the Threshold parameter to a scalar value.
Limitations

- If the data inputs to the Switch block are buses, the element names of both buses must be the same. Using the same element names ensures that the output bus has the same element names no matter which input bus the block selects. To ensure that your model meets this requirement, use a bus object to define the buses and set the **Element name mismatch** diagnostic to **error**. See “Connectivity Diagnostics Overview” for more information.

Ports

Input

**Port_1 — First data input signal**

scalar | vector

First of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the condition for the control input to pass the first input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Port_2 — Control input signal**

scalar | vector

Control signal the block uses to determine whether to pass the first or second data input to the output. If the control input meets the condition set in the **Criteria for passing first input** parameter, then the block passes the first data input. Otherwise, the block passes the second data input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Port_3 — Second data input signal**

scalar | vector

Second of two data inputs. The block propagates either the first or second data input to the output. The block selects which input to pass based on the control input. Specify the
condition for the control input to pass the first or second input using the **Criteria for passing first input** and **Threshold** parameters.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Output**

**Port_1 — Output signal**

scalar | vector

Output signal propagated from either the first or second input signal, based on the control signal value.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Parameters**

**Main**

**Criteria for passing first input — Selection criteria to pass first data input**

u2 >= Threshold (default) | u2 > Threshold | u2 ~= 0

Select the condition under which the block passes the first data input. If the control input meets the condition set in the **Criteria for passing first input** parameter, the block passes the first input. Otherwise, the block passes the second data input signal from input Port_3.

u2 >= Threshold

Checks whether the control input is greater than or equal to the threshold value.

u2 > Threshold

Checks whether the control input is greater than the threshold value.

u2 ~=0

Checks whether the control input is nonzero.

**Note** The Switch block does not support u2 ~=0 mode for enumerated data types.
Tip

When the control input is a Boolean signal, use one of these combinations of condition and threshold value:

• \( u_2 \geq \text{Threshold} \), where the threshold value equals 1
• \( u_2 > \text{Threshold} \), where the threshold value equals 0
• \( u_2 \neq 0 \)

Otherwise, the Switch block ignores threshold values and uses the Boolean value for signal routing. For a value of 1, the block passes the first input, and for a value of 0, the block passes the third input. A warning message that describes this behavior also appears in the MATLAB Command Window.

Programmatic Use

Block Parameter: Criteria
Type: character vector
Value: 'u2 >= Threshold' | 'u2 > Threshold' | 'u2 ~=0'
Default: 'u2 >= Threshold'

Threshold — Threshold used in criteria
\( \theta \) (default) | scalar

Assign the threshold used in the Criteria for passing first input that determines which input the block passes to the output. \( \text{Threshold} \) must be greater than Output minimum and less than Output maximum.

To specify a nonscalar threshold, use brackets. For example, the following entries are valid:

• \([1\ 4\ 8\ 12]\)
• \([\text{MyColors.Red}, \text{MyColors.Blue}]\)

Dependencies

Setting Criteria for passing first input to \( u_2 \neq 0 \) disables this parameter.

Programmatic Use

Block Parameter: Threshold
Type: character vector
Value: 'off' | 'on'
Default: 'off'
Enable zero-crossing detection — Enable zero-crossing detection
on (default) | Boolean

Select to enable zero-crossing detection. For more information, see “Zero-Crossing Detection” in the Simulink documentation.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector, string
Values: 'off' | 'on'
Default: 'on'

Signal Attributes

Click the Show data type assistant button to display the Data Type Assistant, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

Require all data port inputs to have the same data type — Require data ports to have the same data type
off (default) | on

Require all data inputs to have the same data type.

Programmatic Use
Block Parameter: InputSameDT
Type: character vector
Value: 
Default: '0'

Output minimum — Minimum output value for range checking
[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output minimum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**
**Block Parameter:** OutMin  
**Type:** character vector  
**Values:** ' [] ' | scalar  
**Default:** ' [] '

**Output maximum — Maximum output value for range checking**

[] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

• Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
• Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
• Automatic scaling of fixed-point data types.
• Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.
**Programmatic Use**

**Block Parameter**: OutMax  
**Type**: character vector  
**Values**: '\[ \]' | scalar  
**Default**: '\[ \]'  

**Output data type** — **Output data type**  
Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | double | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^0,0) | Enum:  
<class name> | <data type expression>  
Specify the output data type.  
Inherit: Inherit via internal rule  
Uses the following rules to determine the output data type.

<table>
<thead>
<tr>
<th>Data Type of First Input Port</th>
<th>Output Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Has a larger positive range than the third input port</td>
<td>Inherited from the first input port</td>
</tr>
<tr>
<td>Has the same positive range as the third input port</td>
<td>Inherited from the third input port</td>
</tr>
<tr>
<td>Has a smaller positive range than the third input port</td>
<td></td>
</tr>
</tbody>
</table>

Inherit: Inherit via back propagation  
Uses data type of the driving block.  

double  
Specifies output data type is double.  
single  
Specifies output data type is single.  
int8  
Specifies output data type is int8.  
uint8  
Specifies output data type is uint8.
int16
Specifies output data type is int16.

uint16
Specifies output data type is uint16.

int32
Specifies output data type is int32.

uint32
Specifies output data type is uint32.

int64
Specifies output data type is int64.

uint64
Specifies output data type is uint64.

fixdt(1,16,0)
Specifies output data type is fixed point fixdt(1,16,0).

fixdt(1,16,2^0,0)
Specifies output data type is fixed point fixdt(1,16,2^0,0).

Enum: <class name>
Uses an enumerated data type, for example, Enum: BasicColors.

<data type expression>
Uses a data type object, for example, Simulink.NumericType.

Tip
When the output is of enumerated type, both data inputs should use the same enumerated type as the output.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: 'Inherit: Inherit via internal rule'|'Inherit: Inherit via back propagation'|'double'|'single'|'int8'|'uint8'|'int16'|'uint16'|'int32'|'uint32'|'int64'|'uint64'|'fixdt(1,16)'|'fixdt(1,16,0)'|'fixdt(1,16,2^0,0)'|Enum: <class name> | '<data type expression>'
**Default:** 'Inherit: Inherit via internal rule'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types

off (default) | on

Select this parameter to prevent the fixed-point tools from overriding the data types you specify on this block. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

**Programmatic Use**

**Block Parameter:** LockScale  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Integer rounding mode — Specify the rounding mode for fixed-point operations**

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

**Ceiling**

Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB ceil function.

**Convergent**

Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer convergent function.

**Floor**

Rounds both positive and negative numbers toward negative infinity. Equivalent to the MATLAB floor function.

**Nearest**

Rounds number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer nearest function.

**Round**

Rounds number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer round function.
Simplest
Automatically chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero
Rounds number toward zero. Equivalent to the MATLAB fix function.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

See Also
For more information, see “Rounding” (Fixed-Point Designer).

Saturate on integer overflow — Method of overflow action
off (default) | on

Specify whether overflows saturate or wrap.

• off — Overflows wrap to the appropriate value that the data type can represent.

    For example, the number 130 does not fit in a signed 8-bit integer and wraps to -126.

• on — Overflows saturate to either the minimum or maximum value that the data type can represent.

    For example, an overflow associated with a signed 8-bit integer can saturate to -128 or 127.

Tip
• Consider selecting this check box when your model has a possible overflow and you want explicit saturation protection in the generated code.

• Consider clearing this check box when you want to optimize efficiency of your generated code.

    Clearing this check box also helps you to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.

1-2082
- When you select this check box, saturation applies to every internal operation on the block, not just the output or result.
- In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

**Programmatic Use**  
**Block Parameter:** SaturateOnIntegerOverflow  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

Allow different data input sizes — Allow different data input sizes

off (default) | on

Select this check box to allow input signals with different sizes. The block propagates the input signal size to the output signal. If the two data inputs are variable-size signals, the maximum size of the signals can be equal or different.

**Programmatic Use**  
**Block Parameter:** AllowDiffInputSizes  
**Type:** character vector  
**Value:** 'on' | 'off'  
**Default:** 'off'

Manual Switch | Multiport Switch

Introduced before R2006a
Switch Case

Select subsystem execution using logic similar to a switch statement.

**Library:** Simulink / Ports & Subsystems

**Description**

The Switch Case block with Switch Case Action Subsystem blocks containing Action Port blocks, implements switch logic to control subsystem execution.

A Switch Case block has a single input. To select a case, define the input value using the **Case conditions** parameter. The cases are evaluated top down starting with the first case.

Each case is associated with an output port that is attached to a Switch Case Action Subsystem block. When a case is selected, the associated output port sends an action signal to execute the subsystem.
A default case is selected after all of the other case conditions evaluate to false. Providing a default case is optional, even if the other case conditions do not exhaust every possible input value.

Cases for the Switch Case block contain an implied break after a Switch Case Action Subsystem block is executed. Therefore, there is no fall through behavior for the Simulink Switch Case block as found in standard C switch statements.

Ports

Input

u1 (logical operator) — Value for case selection
scalar

Input to the port labeled u1 of a Switch Case block can be:

- A scalar value with a built-in data type that Simulink supports. However, the Switch Case block does not support Boolean or fixed-point data types, and it truncates numeric inputs to 32-bit signed integers.
- A scalar value of any enumerated data type.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | enumerated

Output

case — Action signal for a Switch Case Action Subsystem block
scalar

Output from the Case and default ports are action signals connected to Switch Case Action Subsystem blocks.

Parameters

Case conditions — Specify case values
{1} (default) | list of cases
Specify the cases values using MATLAB cell notation.

{1}

Specify the output port labeled case[1] outputs an action signal when the input port value is 1.

List of ports with case assignments

Specify multiple cases and ports using MATLAB cell notation. For example, entering {1, [7, 9, 4]} specifies that output port case[1] is run when the input value is 1, and output port case [7 9 4] is run when the input value is 7, 9, or 4.

You can use colon notation to specify a range of integer case conditions. For example, entering {[1:5]} specifies that output port case[1 2 3 4 5] is run when the input value is 1, 2, 3, 4, or 5.

Depending on block size, cases from a long list of case conditions are displayed in shortened form on the face of the Switch Case block, using a terminating ellipsis (...).

You can use the enumeration function to specify case conditions that include a case for every value in an enumerated type.

**Programmatic Use**

**Block Parameter:** CaseConditions  
**Type:** character vector  
**Values:** '{1}' | '<list of cases>'  
**Default:** '{1}'

**Show default case — Control display of default output port**

*off (default) | on*

Control display of default output port.

*off*

Hide default output port.

*on*

Display default output port as the last case on the Switch Case block. This allows you to specify a default case that executes when the input value does not match any of the other case values.

**Programmatic Use**

**Block Parameter:** ShowDefaultCase
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Enable zero-crossing detection — Control zero-crossing detection
on (default) | off

Control zero-crossing detection.

✅ on
   Detect zero crossings.

☐ off
   Do not detect zero crossings.

Programmatic Use
Block Parameter: ZeroCross
Type: character vector
Values: 'on' | 'off'
Default: 'on'

Select Subsystem Execution

Introduced before R2006a
Switch Case Action Subsystem

Subsystem whose execution is enabled by a Switch Case block

Library: Simulink / Ports & Subsystems

Description

The Switch Case Action Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem whose execution is controlled by a Switch Case block. The input port to a Switch Case block selects a case defined using the **Case conditions** parameter. Depending on input value and case selected, an action signal is sent to execute a Switch Case Action Subsystem block.

All blocks in a Switch Case Action Subsystem block must run at the same rate as the driving Switch Case block. You can achieve this requirement by setting each block sample time parameter to be either inherited (-1) or the same value as the Switch Case block sample time.

**Merge signals from Switch Case Subsystem blocks**

This example shows how to create a one signal from multiple subsystem output signals. The Switch Case block selects the execution of one If Action Subsystem block from a set of subsystems. Regardless of which subsystem the Switch Case block selects, you can create a one resulting signal with a Merge block.
**Ports**

**Input**

**In1 — Signal input to a subsystem block**

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Action — Control signal input to a subsystem block**

scalar | vector | matrix

Placing an Action Port block in a subsystem block adds an external input port to the block and changes the block to a Switch Case Action Subsystem block.

Dot-dash lines from a Switch Case block to an Switch Case Action Subsystem block represent action signals. An action signal is a control signal connected to the action port of an Switch Case Action Subsystem block. A message on the action signal initiates execution of the subsystem.

Data Types: action
Output

Out1 — Signal output from a subsystem
scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Tapped Delay

Delay scalar signal multiple sample periods and output all delayed versions

Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Tapped Delay block delays an input by the specified number of sample periods and provides an output signal for each delay. For example, when you specify 4 for **Number of delays** and **Order output starting with** is **Oldest**, the block provides four outputs — the first delayed by four sample periods, the second delayed by three, and so on. Use this block to discretize a signal in time or resample a signal at a different rate.

The block accepts one scalar input and generates an output vector that contains data for each incremental delay. Specify the order of the delayed signals in the output vector with the **Order output vector starting with** parameter:

- **Oldest** orders the output vector starting with the oldest delay version and ending with the newest delay version.
- **Newest** orders the output vector starting with the newest delay version and ending with the oldest delay version.

Specify the output vector for the first sampling period with the **Initial condition** parameter. Careful selection of this parameter can mitigate unwanted output behavior.

Specify the time between samples with the **Sample time** parameter. Specify the number of delays with the **Number of delays** parameter. A value of -1 instructs the block to inherit the number of delays by backpropagation. Each delay is equivalent to the $z^{-1}$ discrete-time operator, which the Unit Delay block represents.
Ports

Input
Port_1 — Input signal
scalar

Input signal to delay.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output
Port_1 — Delayed versions of input signal
scalar | vector

All versions of the delayed input signal. Use the Order output vector starting with parameter to specify the order of delayed signals in the output vector.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Parameters

Initial condition — Initial output
0.0 (default) | scalar

Specify the initial output of the simulation. The Initial condition parameter is converted from a double to the input data type offline using round-to-nearest and saturation.

Limitations

The initial condition of this block cannot be inf or NaN.

Programmatic Use
Block Parameter: vinit
Type: character vector
Values: scalar
Default: '0.0'
Sample time — Time between samples
-1 (default) | scalar | vector

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. For more information, see “Specify Sample Time”.

Programmatic Use
Block Parameter: samptime
Type: character vector
Values: scalar | vector
Default: '-1'

Number of delays — Number of discrete-time operators
4 (default) | positive scalar | -1 (for inherited)

Specify the number of discrete-time operators as a positive scalar, or -1 for inherited.

Programmatic Use
Block Parameter: NumDelays
Type: character vector
Values: positive scalar | -1 (inherited)
Default: '4'

Order output vector starting with — Order of output
Oldest (default) | Newest

Specify whether to output the oldest delay version first, or the newest delay version first.

Programmatic Use
Block Parameter: DelayOrder
Type: character vector
Values: 'Oldest' | 'Newest'
Default: 'Oldest'

Include current input in output vector — Include current input in output vector
off (default) | on

Select this check box to include the current input in the output vector.

Programmatic Use
Block Parameter: includeCurrent
Type: character vector
Values: 'off' | 'on'
Default: 'off'

**Terminate Function**

Execute contents on a model terminate event  
**Library:** Simulink / User-Defined Functions

**Description**

The Terminate Function block is a pre-configured subsystem block that executes on a model terminate event. By default, the Terminate Function block includes an Event Listener block with **Event** set to **Terminate**, a Terminator block, and a State Reader block.

Replace the Terminator block with blocks to save the state value from the State Reader block.

Conditionally executed subsystem blocks with output ports fully supported within Terminate Function blocks

For a list of unsupported blocks and features, see “Initialize, Reset, and Terminate Function Limitations”.

The input and output ports of a component containing Initialize Function and Terminate Function blocks must connect to input and output port blocks.
The code generated from this block is part of the `model_terminate` function that is called once at the end of model execution.

Terminator

Terminate unconnected output port

**Library:**
- Simulink / Commonly Used Blocks
- Simulink / Sinks
- HDL Coder / Sinks

**Description**

Use the Terminator block to cap blocks whose output ports do not connect to other blocks. If you run a simulation with blocks having unconnected output ports, Simulink issues warning messages. Using Terminator blocks to cap those blocks helps prevent warning messages.

**Ports**

**Input**

**Port_1 — Input signal**

- scalar | vector | matrix | n-D array | bus

Use this port to direct signals from output ports that are otherwise unconnected during a simulation. The port accepts real or complex signals of all data types.

Timed-Based Linearization

Generate linear models in base workspace at specific times

Library: Simulink / Model-Wide Utilities

Description

This block calls linmod or dlinmod to create a linear model for the system when the simulation clock reaches the time specified by the Linearization time parameter. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- BufferReuse = 'off'
- RTWInlineParameters = 'on'
- BlockReductionOpt = 'off'

The name of the structure used to save the snapshots is the name of the model appended by _Timed_Based Linearization, for example, vdp_Timed_Based Linearization. The structure has the following fields:

<table>
<thead>
<tr>

</table>

**Tip** To generate models conditionally, use the Trigger-Based Linearization block.

**Parameters**

**Linearization time — Time at which to generate a linear model**

1 (default) | scalar | vector

Time at which you want the block to generate a linear model. Enter a vector of times if you want the block to generate linear models at more than one time step.

Programmatic Use

Block Parameter: LinearizationTime

Type: character vector

Values: scalar | vector

Default: '1'

**Sample time (of linearized model) — Sample time**

0 (default) | scalar | vector

Specify a sample time for the linear model. To create a continuous-time model using linmod, specify a sample time of 0. Otherwise, to create a discrete-time model using dlinmod, specify a positive sample time (see “Discrete-Time System Linearization” on page 2-58).

Programmatic Use

Block Parameter: SampleTime

Type: character vector

Values: scalar | vector

Default: '0'

Introduced in R2010a
To File

Write data to file
Library: Simulink / Sinks
        HDL Coder / Sinks

Description

The To File block writes input signal data into a MAT-file. The block writes to the output file incrementally, with minimal memory overhead during simulation. If the output file exists when the simulation starts, the block overwrites the file. The file automatically closes when you pause the simulation or the simulation completes. If simulation terminates abnormally, the To File block saves the data it has logged up until the point of the abnormal termination.

The To File block icon shows the name of the output file.

Control Amount of Data Saved

If you specify data logging intervals with the Configuration Parameters > Data Import/Export > Logging intervals parameter, the To File block logs only data inside of the intervals. For example, the block logs no data if the intervals are empty ([ ]). The block stores the logged data in the file associated with the block instead of in the variable that you specify for the Single simulation output parameter.

For variable-step solvers, to control the amount of data available to the To File block, use the Configuration Parameters > Data Import/Export > Additional parameters > Output options parameter. For example, to write data at identical time points over multiple simulations, select the Produce specified output only option.

Block parameters also control the amount of data saved. See “Decimation” on page 1-0 and “Sample time” on page 1-0.

Pause Simulation

After pausing a simulation, do not alter any file that a To File block logs into. For example, do not save such a file with the MATLAB save command. Altering the file can cause an
error when you resume the simulation. If you want to alter the file after pausing, copy the file and work with the copy of the file.

If you pause using the Simulation Stepper, the To File block captures the simulation data up to the point of the pause. When you step back, the To File data file no longer contains any simulation data past the new reduced time of the last output.

**Limitations**

When a To File block is in a referenced model, that model must be a single-instance model. Only one instance of such a model can exist in a model hierarchy. See “Model Reuse” for more information.

**Ports**

**Input**

**Port 1 — Input signal**

Scalar | Vector | Matrix | N-D Array

Signal to store in file. Each sample consists of a timestamp and an associated data value. The data can be in array format or MATLAB timeseries format. The To File block accepts real or complex signal data of any data type that Simulink software supports, except fixed-point data with a word length greater than 32 bits.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Parameters**

**File name — Path or file name**

Untitled.mat (default) | MAT-file path or name

Specify the path or file name of the MAT-file in which to store the output. On UNIX systems, the path name can start with a tilde (~) character signifying your home folder. If you specify a file name without path information, Simulink software stores the file in the
MATLAB working folder. (To determine the working folder, at the MATLAB command line, enter `pwd`.) If the file exists, Simulink software overwrites it.

**Programmatic Use**

**Block Parameter:** FileName  
**Type:** character vector  
**Values:** MAT-file path or name  
**Default:** 'untitled.mat'

**Variable name — Matrix name**

*ans (default)* | character vector

Specify the name of the matrix contained in the file.

**Programmatic Use**

**Block Parameter:** MatrixName  
**Type:** character vector  
**Values:** character vector  
**Default:** 'ans'

**Save format — Data format**

*Timeseries (default)* | Array

Specify the data format that the To File block uses for writing data.

Use the *Array* format only for vector, double, noncomplex signals.

For the *Timeseries* format, the To File block:

- Writes data in a MATLAB timeseries object.
- Supports writing multidimensional, real, or complex output values.
- Supports writing output values that have any built-in data type, including Boolean, enumerated (enum), and fixed-point data with a word length of up to 32 bits.
- For virtual and nonvirtual bus input signals, creates a MATLAB structure that matches the bus hierarchy. Each leaf of the structure is a MATLAB timeseries object.

For the *Array* format, the To File block:

- Writes data into a matrix containing two or more rows. The matrix has the following form:
Simulink software writes one column to the matrix for each data sample. The first element of the column contains the timestamp. The remainder of the column contains data for the corresponding output values.

- Supports writing data that is one-dimensional, double, and noncomplex.

The From File block can use data written by a To File block in any format (*Timeseries* or *Array*) without any modifications to the data or other special provisions.

The From Workspace block can read data that is in the *Array* format and is the transposition of the data written by the To File block. To provide the required format, use MATLAB commands to load and transpose the data from the MAT-file.

The following table shows how simulation mode support depends on the **Save format** value.

</tr>
</tbody>
</table>

**Programmatic Use**

**Block Parameter:** SaveFormat  
**Type:** character vector
**Decimation** — Decimation factor that determines when data writes
1 (default) | scalar | vector

Specify the decimation factor, \( n \), that writes data at every \( n \)th time that the block executes. The default value has this block writing data at every time step.

**Programmatic Use**
**Block Parameter:** Decimation
**Type:** character vector
**Values:** scalar | vector
**Default:** '1'

**Sample time** — Sample period and offset
-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See “Specify Sample Time”.

**Programmatic Use**
**Block Parameter:** SampleTime
**Type:** character vector
**Values:** scalar | vector
**Default:** '-1'

Variable-Size Signals | no
---|---
Zero-Crossing Detection | no

a. Supports up to 32-bit fixed-point data types.

**Tips**

- If MATLAB encounters memory issues when you log many signals in a long simulation that has many time steps, consider logging to persistent storage. When you log to persistent storage, the `Dataset` format logging data is stored in a MAT-file. Compared to logging to persistent storage, connecting a To File block to signals:
  - Is a per-signal approach that can clutter a model with several To File blocks attached to individual signals.
  - Creates a separate MAT-file for each To File block, compared to the one MAT-file that logging to persistent storage uses.

For details, see “Log Data to Persistent Storage”.

- To avoid the overhead of compressing data in real time, the To File block writes an uncompressed Version 7.3 MAT-file. To compress the data within the MAT-file, load and save the file in MATLAB. The resaved file is smaller than the original MAT-file that the To File block created, because the `Save` command compresses the data in the MAT-file.

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Not recommended for production code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. Generated code can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot
support such code. Usually, blocks evolve toward being suitable for production code. Thus, blocks suitable for production code remain suitable.

Code generation for RSim target provides identical support as Simulink; all other code generation targets support only double, one-dimensional, real signals in array with time format.

To generate code for a To File block, on the Code Generation > Interface pane, select the configuration parameter “MAT-file logging” (Simulink Coder).

**HDL Code Generation**
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for writing simulation results to a file when used with subsystems that generate HDL code, but is not included in the hardware implementation

**PLC Code Generation**
Generate Structured Text code using Simulink® PLC Coder™.

**Fixed-Point Conversion**
Design and simulate fixed-point systems using Fixed-Point Designer™.

Supports up to 32-bit fixed-point data types.

*Introduced before R2006a*
To Workspace

Write data to workspace

**Library:**
- Simulink / Sinks
- HDL Coder / Sinks

**Description**

The To Workspace block writes input signal data to a workspace. During simulation, the block writes data to an internal buffer. When you pause the simulation or the simulation completes, that data is written to the workspace. Data is not available until the simulation pauses or stops.

The To Workspace block typically writes data to the MATLAB base workspace. For a `sim` command in a MATLAB function, the To Workspace block sends data to the workspace of the calling function, not to the MATLAB base workspace. To send the logged data to the base workspace, use an `assignin` command in the function.

```matlab
function myfunc
    a = sim('mTest','SimulationMode','normal');
    b = a.get('simout')
    assignin('base','b',b);
end
```

The To Workspace block icon shows the name of the variable to which the data is written.

**Control Amount of Data Saved**

If you specify data logging intervals with the **Configuration Parameters > Data Import/Export > Logging intervals** parameter, the To Workspace block does not log data outside of the intervals. For example, the block logs no data if the intervals are empty (`[]`). The block stores the logged data in the variable that you specify for the **Single simulation output** parameter.

For variable-step solvers, to control the amount of data available to the To Workspace block, use the **Configuration Parameters > Data Import/Export > Additional parameters > Output options** parameter. For example, to write data at identical time points over multiple simulations, select the **Produce specified output only** option.
Block parameters also control the amount of data saved. See “Limit data points to last” on page 1-0, “Decimation” on page 1-0, and “Sample time” on page 1-0.

**Log to MAT-File**

When you enable the **MAT-file logging** parameter in **Configuration Parameters**, the To Workspace block logs its data to a MAT-file. For information about this parameter, see “MAT-file logging” (Simulink Coder).

**Ports**

**Input**

**Port_1 — Input signal**

scalar | vector | matrix | N-D array

Workspace data created from input signal. The To Workspace block can save real or complex inputs of any data type that Simulink supports, including fixed-point and enumerated data types, and bus objects.

By default, the To Workspace block treats input signals as sample-based. To have the To Workspace block treat input signals as frame-based, set:

1. **Save format** to either Array or Structure
2. **Save 2-D signals as** to 2-D array (concatenate along first dimension)

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Parameters**

**Variable name — Name of variable for saved data**

simout (default) | character vector

Specify the name of the variable for the saved data.
Programmatic Use
Block Parameter: VariableName
Type: character vector
Values: character vector
Default: 'simout'

Limit data points to last — Maximum number of input samples to save
inf (default) | scalar | vector

Specify the maximum number of input samples to save. If the simulation generates more data points than the specified maximum, the simulation saves only the most recently generated samples. The default value causes the block to write all data.

Programmatic Use
Block Parameter: MaxDataPoints
Type: character vector
Values: scalar | vector
Default: 'inf'

Decimation — Decimation factor that determines when data writes
1 (default) | scalar | vector

Specify the decimation factor, n, which writes data at every nth time that the block executes. The default value causes the block to write data at every time step.

Programmatic Use
Block Parameter: Decimation
Type: character vector
Values: scalar | vector
Default: '1'

Save format — Format for saving simulation output
Timeseries (default) | Structure With Time | Structure | Array

Specify the format for saving simulation output to the workspace.

The default Timeseries format saves nonbus signals as a MATLAB timeseries object and bus signals as a structure of MATLAB timeseries objects.

The Array format saves the input as an N-dimensional array where N is one more than the number of dimensions of the input signal. For example, if the input signal is a vector, the resulting workspace array is two-dimensional. If the input signal is a matrix, then the
array is three-dimensional. How Simulink stores samples in the array depends on whether
the input signal is a scalar, vector, or matrix.

• If the input signal is a scalar or a vector, each input sample is output as a row of the
array. Suppose that the name of the output array is simout. Then, simout(1,:) corresponds to the first sample, simout(2,:) corresponds to the second sample, and so on.

• If the input signal is a matrix, time corresponds to the third dimension. Suppose again
that simout is the name of the resulting workspace array. Then, simout(:,1) is the input signal value at the first sample point, simout(:,2) is the input signal value at the second sample point, and so on.

The Structure format consists of a structure with three fields:

• time — Empty field for this format.

• signals — Structure with three fields: values, dimensions, and label. The
   values field contains the array of signal values. The dimensions field specifies the
   dimensions of the corresponding signals. The label field contains the label of the
   input line.

• blockName — Name of the To Workspace block.

The Structure With Time format is the same as Structure, except that the time field
contains a vector of simulation time hits.

If you select Array or Structure, the Save 2-D signals as parameter appears.

To read the To Workspace block output directly with a From Workspace block, use either
the Timeseries or Structure with Time format. The From Workspace block can read
sample-based data from a To Workspace block that was saved in a previous simulation.
For details, see “Comparison of Signal Loading Techniques”.

The following table shows how simulation mode support depends on the Save format
value.

<table>
<thead>
<tr>
<th>Simulation Mode</th>
<th>Timeseries</th>
<th>Array, Structure, or Structure With Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>

</tr>
</tbody>
</table>

Programmatic Use

**Block Parameter:** SaveFormat

**Type:** character vector

**Values:** 'Timeseries' | 'Structure with Time' | 'Structure' | 'Array'

**Default:** 'Timeseries'

Save 2-D signal as — Format for saving 2-D signals

3-D array (concatenate along third dimension) (default) | 2-D array (concatenate along first dimension)

Specify one of these formats for saving 2-D signals to the workspace:

- **3-D array (concatenate along third dimension) (Default)**

  This setting is well-suited for sample-based signals. Data is concatenated along the third dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 2-by-4-by-10 array.

- **2-D array (concatenate along first dimension)**

  This setting is well-suited for frame-based signals. Data is concatenated along the first dimension. For example, 2-by-4 matrix input for 10 samples is stored as a 20-by-4 array.
When the **Save format** is set to **Array** or **Structure**, the dimensions of the output depend on the input dimensions and the setting of the **Save 2-D signals as** parameter. The following table summarizes the output dimensions under various conditions. In the table, $K$ represents the value of the **Limit data points to last** parameter.

<table>
<thead>
<tr>
<th>Input Signal Dimensions</th>
<th>Save 2-D Signals As ...</th>
<th>Signal to Workspace Output Dimension</th>
</tr>
</thead>
<tbody>
<tr>
<td>$M$-by-$N$ matrix</td>
<td>2-D array (concatenate along first dimension)</td>
<td>$K$-by-$N$ matrix. If you set the <strong>Limit data points to last</strong> parameter to <code>inf</code>, $K$ represents the total number of samples acquired in each column by the end of simulation. This setting is equivalent to multiplying the input frame size ($M$) by the total number of $M$-by-$N$ inputs acquired by the block.</td>
</tr>
<tr>
<td>$M$-by-$N$ matrix</td>
<td>3-D array (concatenate along third dimension)</td>
<td>$M$-by-$N$-by-$K$ array. If you set the <strong>Limit data points to last</strong> parameter to <code>inf</code>, $K$ represents the total number of $M$-by-$N$ inputs acquired by the end of the simulation.</td>
</tr>
<tr>
<td>Length-$N$ unoriented vector</td>
<td>Any setting</td>
<td>$K$-by-$N$ matrix</td>
</tr>
<tr>
<td>$N$-dimensional array where $N &gt; 2$</td>
<td>Any setting</td>
<td>Array with $N + 1$ dimensions, where the size of the last dimension is equal to $K$. If you set the <strong>Limit data points to last</strong> parameter to <code>inf</code>, $K$ represents the total number of $M$-by-$N$ inputs acquired by the end of simulation</td>
</tr>
</tbody>
</table>
Dependencies

To enable the **Save 2-D signals as** parameter, set the **Save format** to **Array** or **Structure**.

**Programmatic Use**

**Block Parameter:** Save2DSignal  
**Type:** character vector  
**Values:** '2-D array (concatenate along first dimension)' | '3-D array (concatenate along third dimension)'  
**Default:** '3-D array (concatenate along third dimension)'

**Log fixed-point data as a fi object — Log fixed-point data as a fi object or double**

**off** (default) | on

By default, the To Workspace block logs fixed-point data to the MATLAB workspace as a Fixed-Point Designer fi object. If you clear this parameter, Simulink software logs fixed-point data to the workspace as double.

**Programmatic Use**

**Block Parameter:** FixptAsFi  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Sample time — Sample period and offset**

-1 (default) | scalar | vector

Specifies the sample period and offset at which to collect data points. This parameter is useful when you are using a variable-step solver where the interval between time steps is not constant. The default value causes the block to inherit the sample time from the driving block. See “Specify Sample Time”.

**Programmatic Use**

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar | vector  
**Default:** '-1'

Tips

To make post-processing easier, you can convert data saved by this block to Dataset format. This conversion is useful when post processing this data with other logged data that can use Dataset format (for example, logged states). See “Convert Logged Data to Dataset Format”. You can also use signal logging with a variable-size signal exception.

Extended Capabilities

**HDL Code Generation**

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

This block can be used for simulation visibility in subsystems that generate HDL code, but is not included in the hardware implementation.

**PLC Code Generation**

Generate Structured Text code using Simulink® PLC Coder™.
Fixed-Point Conversion
Design and simulate fixed-point systems using Fixed-Point Designer™.

“Limit Amount of Exported Data”
“Convert Logged Data to Dataset Format”

Introduced before R2006a
Toggle Switch

Toggle parameter between two values
Library: Simulink / Dashboard

Description

The Toggle Switch block toggles the value of the connected block parameter between two values during simulation. For example, you can connect the Toggle Switch block to a Switch block in your model and change its state during simulation. Use the Toggle Switch block with other Dashboard blocks to create an interactive dashboard for your model.

Double-clicking the Toggle Switch block does not open its dialog box during simulation and when the block is selected. To edit the block's parameters, you can use the Property Inspector, or you can right-click the block and select Block Parameters from the context menu.

Connecting Dashboard Blocks

Dashboard blocks do not use ports to make connections. To connect Dashboard blocks to variables and block parameters in your model, use connect mode. Connect mode facilitates the process of connecting Dashboard blocks in your model, especially when you want to connect multiple blocks at once. If you only want to connect a single Dashboard block, you can also use the Connection table in the block dialog box to make the connection.

Tip To facilitate understanding and debugging your model, you can modify Dashboard block connections in your model during normal and accelerator mode simulations.
**Note** Dashboard blocks cannot connect to variables until you update your model diagram. To connect Dashboard blocks to variables or modify variable values between opening your model and running a simulation, update your model diagram using **Ctrl+D**.

To enter connect mode, click the **Connect** button that appears above your unconnected Dashboard block when you pause on it.

In connect mode, when you select one or more signals or blocks, a list of parameters and signals available for connection appears. Select a signal or parameter from the list to connect the selected Dashboard block. To connect another Dashboard block, pause on the block and click the **Connect** button above it. Then, make a selection of signals and blocks in your model, and choose a signal or parameter to connect.
When you finish connecting the Dashboard blocks in your model, click the **Exit** button in the upper-right of the canvas to exit connect mode.

**Tip** You can hide the message shown on unconnected blocks using the `set_param` function with the `ShowInitialText` block parameter.

**Parameter Logging**

Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector, where you can view parameter values along with logged signal data. You can access logged parameter data in the MATLAB workspace by exporting the parameter data from the Simulation Data Inspector UI or by using the `Simulink.sdi.exportRun` function. For more information about exporting data with the Simulation Data Inspector UI, see “Export Data from the Simulation Data Inspector”. The parameter data is stored in a `Simulink.SimulationData.Parameter` object, accessible as an element in the exported `Simulink.SimulationData.Dataset`. 

1-2128
Limitations

- Dashboard blocks can only connect to real scalar signals.
- You cannot use the Connection table to connect a Dashboard block to a block that is commented out. When you connect a Dashboard block to a commented block using connect mode, the Dashboard block does not display the connected value until the you uncomment the block.
- Dashboard blocks cannot connect to signals inside referenced models.
- When you simulate a model hierarchy, Dashboard blocks inside referenced models do not update.
- Dashboard blocks do not support rapid accelerator simulation.
- Some signals are not available during accelerator mode simulations. To view such signals on a Dashboard block, mark the signal for logging.
- Parameters specified by indexing a variable array do not appear in the Connection table. For example, a block parameter defined as engine(1) using the variable engine does not appear in the table.

To access the parameter in the Connection table, assign the indexed value to a scalar variable, such as engine_1. Then, use the scalar variable to define the block parameter.

- When you connect a Dashboard block to a variable or parameter during simulation, the data for that variable or parameter does not get logged to the Simulation Data Inspector. To log variable and parameter data to the Simulation Data Inspector, connect the Dashboard block to the variable or parameter prior to simulation.
- When you simulate a model in external mode with the Default parameter behavior set to Inlined, Dashboard blocks can appear to change parameter and variable values. However, the change does not propagate to the simulation. For example, the Gain block displays changes made to its Gain parameter using the Dashboard blocks, but the Gain value used in the simulation does not change.

Parameters

Connection — Select a variable or block parameter to connect
variable and parameter connection options

Select the variable or block parameter to control using the Connection table. Populate the Connection table by selecting one or more blocks in your model. Select the radio
button next to the variable or parameter you want to control, and click **Apply**. To facilitate understanding and debugging your model, you can connect Dashboard blocks to variables and parameters in your model during simulation.

**Note** To see workspace variables in the connection table, update the model diagram using **Ctrl+D**.

**Programmatic Use**

To programmatically connect a Dashboard block to a tunable parameter or a variable, use a `Simulink.HMI.ParamSourceInfo` object. The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply to connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

**Block Parameter:** Binding  
**Type:** `Simulink.HMI.ParamSourceInfo`  
**Default:** `[ ]`

**States — Pair values and labels**

Scalar and character vector

Pairs of values to assign to the connected variable or parameter and text to display on the block. Switches have two states — **Top** and **Bottom** — one corresponding to each switch position. Each state contains a **Value** and a **Label**.

- **Value** — Value to assign to the connected variable or parameter when the switch is in the corresponding position.
- **Label** — Text to display on the block for the corresponding position.

This table describes the default configuration for the block.

**States**

<table>
<thead>
<tr>
<th>Position</th>
<th>State Value</th>
<th>State Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top</td>
<td>0</td>
<td>on</td>
</tr>
<tr>
<td>Bottom</td>
<td>1</td>
<td>off</td>
</tr>
</tbody>
</table>
**Programmatic Use**

To configure the **States** for the block programmatically, specify the value of the **States** parameter as a structure array containing two elements with fields:

- **Value** — Scalar double value for the state.
- **Label** — String or character array to use as the label for the switch position.

```matlab
topState.Value = 0;
topState.Label = 'Off';
bottomState.Value = 1;
bottomState.Label = 'On';
switchStates = [topState bottomState];
```

**Block Parameter:** States  
**Type:** two element array of structures

**Label — Block label position**  
**Top** (default) | **Bottom** | **Hide**

Position of the block label. When the block is connected to an element in the model, the label is the name of the connected element.

**Programmatic Use**  
**Block Parameter:** LabelPosition  
**Type:** character vector  
**Values:** 'Top' | 'Bottom' | 'Hide'  
**Default:** 'Top'

**Block Characteristics**

To String

Convert input signal to string signal

Library: Simulink / String

Description

The To String block creates a string signal from an input signal. For example, consider using this signal to convert a logical value 1 or 0 to its string equivalent "false" or "true".

When a MinGW compiler compiles code generated from the block, running the compiled code may produce nonstandard results for floating-point inputs. For example, a numeric input of 501.987 returns the string "5.019870e+002" instead of the expected string "5.019870e+02".

Ports

Input

Port_1 — Input signal
scalar

Input signal, specified as a scalar.

Output

Port_1 — Output string
scalar

Output string, specified as a scalar. This block returns the output as a string, surrounded by double quotes.
• If the input is a Boolean, the output is a logical value (1 or 0) and the block returns its textual equivalent (true or false).

• If the input is a numeric data type, such as an integer, single, double, or fixed point, the block returns the number as a string. For example, an input of 1 converts to "1" and an input of 0 converts to "0".

**Note** The output string might not contain all the digits of the numeric value from the input port.

Data Types: string

Transfer Fcn

Model linear system by transfer function
Library: Simulink / Continuous

Description

The Transfer Fcn block models a linear system by a transfer function of the Laplace-domain variable \( s \). The block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Transfer Fcn block assumes the following conditions:

- The transfer function has the form

\[
H(s) = \frac{y(s)}{u(s)} = \frac{\text{num}(s)}{\text{den}(s)} = \frac{\text{num}(1)s^{nn-1} + \text{num}(2)s^{nn-2} + \ldots + \text{num}(nn)}{\text{den}(1)s^{nd-1} + \text{den}(2)s^{nd-2} + \ldots + \text{den}(nd)},
\]

where \( u \) and \( y \) are the system input and outputs, respectively, \( nn \) and \( nd \) are the number of numerator and denominator coefficients, respectively. \( \text{num}(s) \) and \( \text{den}(s) \) contain the coefficients of the numerator and denominator in descending powers of \( s \).

- The order of the denominator must be greater than or equal to the order of the numerator.
- For a multiple-output system, all transfer functions have the same denominator and all numerators have the same order.

Modeling a Single-Output System

For a single-output system, the input and output of the block are scalar time-domain signals. To model this system:

1. Enter a vector for the numerator coefficients of the transfer function in the Numerator coefficients field.
2 Enter a vector for the denominator coefficients of the transfer function in the **Denominator coefficients** field.

### Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1 Enter a matrix in the **Numerator coefficients** field.

   Each row of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

2 Enter a vector of the denominator coefficients common to all transfer functions of the system in the **Denominator coefficients** field.

### Specifying Initial Conditions

A transfer function describes the relationship between input and output in Laplace (frequency) domain. Specifically, it is defined as the Laplace transform of the response (output) of a system with zero initial conditions to an impulse input.

Operations like multiplication and division of transfer functions rely on zero initial state. For example, you can decompose a single complicated transfer function into a series of simpler transfer functions. Apply them sequentially to get a response equivalent to that of the original transfer function. This will not be correct if one of the transfer functions assumes a non-zero initial state. Furthermore, a transfer function has infinitely many time domain realizations, most of whose states do not have any physical meaning.

For these reasons, Simulink presets the initial conditions of the Transfer Fcn block to zero. To specify initial conditions for a given transfer function, convert the transfer function to its controllable, canonical state-space realization using `tf2ss`. Then, use the State-Space block. The `tf2ss` utility provides the A, B, C, and D matrices for the system.

For more information, type `help tf2ss` or see the Control System Toolbox™ documentation.

### Transfer Function Display on the Block

The Transfer Fcn block displays the transfer function depending on how you specify the numerator and denominator parameters.
• If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified coefficients and powers of \( s \). If you specify a variable in parentheses, the block evaluates the variable.

For example, if you specify **Numerator coefficients** as \([3, 2, 1]\) and **Denominator coefficients** as \((\text{den})\), where \(\text{den}\) is \([7, 5, 3, 1]\), the block looks like this:

\[
\frac{3s^2+2s+1}{7s^3+5s^2+3s+1}
\]

• If you specify each parameter as a variable, the block shows the variable name followed by \((s)\).

For example, if you specify **Numerator coefficients** as \(\text{num}\) and **Denominator coefficients** as \(\text{den}\), the block looks like this:

\[
\frac{\text{num}(s)}{\text{den}(s)}
\]

### Ports

#### Input

**Port 1 — Input signal**

**scalar**

Input signal, specified as a scalar with data type **double**.

Data Types: **double**
Output

Port_1 — Output signal
scalar | vector

Output signal, provided as a scalar or vector with data type double.

• For a single-output system, the input and output of the block are scalar time-domain signals.
• For a multiple-output system, the input is a scalar, and the output is a vector, where each element is an output of the system.

Data Types: double

Parameters

Numerator coefficients — Vector or matrix of numerator coefficients
[1] (default) | vector | matrix

Define the numerator coefficients of the transfer function.

• For a single-output system, enter a vector for the numerator coefficients of the transfer function.
• For a multiple-output system, enter a matrix. Each row of this matrix contains the numerator coefficients of a transfer function that determines one of the block outputs.

Programmatic Use
Block Parameter: Numerator
Type: character vector, string
Values: vector | matrix
Default: ' [1]'

Denominator coefficients — Row vector of denominator coefficients
[1 1] (default) | vector

Define the row vector of denominator coefficients.

• For a single-output system, enter a vector for the denominator coefficients of the transfer function.
• For a multiple-output system, enter a vector containing the denominator coefficients common to all transfer functions of the system.

**Programmatic Use**

**Block Parameter:** Denominator  
**Type:** character vector, string  
**Values:** vector  
**Default:** '[1 1]'

**Absolute tolerance — Absolute tolerance for computing block states**  
*auto* (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify auto or -1.

• If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.

• If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.

• If you enter auto or -1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

**Programmatic Use**

**Block Parameter:** AbsoluteTolerance  
**Type:** character vector, string  
**Values:** 'auto' | '-1' | any positive real-valued scalar or vector  
**Default:** 'auto'

**State Name (e.g., 'position') — Assign unique name to each state**  
' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

• To assign a name to a single state, enter the name between quotes, for example, 'position'.

• To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
• To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

**Limitations**

• The state names apply only to the selected block.
• The number of states must divide evenly among the number of state names.
• You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

**Programmatic Use**

**Block Parameter:** ContinuousStateAttributes

**Type:** character vector; string

**Values:** ' ' | user-defined

**Default:** ' '

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Transfer Fcn Direct Form II

Implement Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional
Discrete

Description

The Transfer Fcn Direct Form II block implements a Direct Form II realization of the transfer function that the Numerator coefficients and Denominator coefficients excluding lead parameters specify. The block supports only single input-single output (SISO) transfer functions.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal, specified as a scalar or vector.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Port_1 — Output signal
scalar | vector

Output signal, specified as a scalar or vector.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

Numerator coefficients — Numerator coefficients
[0.2 0.3 0.2] (default) | vector

Specify the numerator coefficients as a vector.

Programmatic Use
Block Parameter: NumCoefVec
Type: character vector
Values: vector
Default: '

Denominator coefficients excluding lead — Denominator coefficient
[-0.9 0.6] (default) | vector

Specify the denominator coefficients, excluding the leading coefficient, which must be 1.0.

Programmatic Use
Block Parameter: DenCoeffVec
Type: character vector
Values: vector
Default: '

Initial condition — Initial condition
0.0 (default) | scalar

Specify the initial condition as a scalar.

Programmatic Use
Block Parameter: vinit
Type: character vector
Values: scalar
Default: '0.0'

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero
Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

Saturate to max or min when overflows occur — Method of overflow action
off (default) | on

When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

Programmatic Use
Block Parameter: DoSatur
Type: character vector
Values: 'off' | 'on'
Default: 'off'

**Introduced before R2006a**
Transfer Fcn Direct Form II Time Varying

Implement time varying Direct Form II realization of transfer function

Library: Simulink / Additional Math & Discrete / Additional
         Discrete

Description

The Transfer Fcn Direct Form II Time Varying block implements a Direct Form II realization of the specified transfer function. The block supports only single input-single output (SISO) transfer functions.

The input signal labeled Den No Lead contains the denominator coefficients of the transfer function. The full denominator has a leading coefficient of one, but it is excluded from the input signal. For example, to use a denominator of \([1 \ -1.7 \ 0.72]\), specify a signal with the value \([-1.7 \ 0.72]\). The input signal labeled Num contains the numerator coefficients. The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

The block automatically selects the data types and scalings of the output, the coefficients, and any temporary variables.

Ports

Input

\(u\) — Input signal
scalar | vector

Input signal, specified as a scalar or vector.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

1-2147
**Num — Numerator coefficients**

Scalar | Vector

Numerator coefficients of the transfer function, specified as a scalar or vector.

**Dependencies**

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same. Pad the numerator vector with zeros, if needed.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Den No Lead — Denominator coefficients**

Scalar | Vector

Denominator coefficients of the transfer function, specified as a scalar or vector, without the leading coefficient of one. The full denominator has a leading coefficient of one, but it is excluded from the input signal.

Example: For a denominator coefficient of \([1 \ -1.7 \ 0.72]\), specify a signal with value \([-1.7 \ 0.72]\).

**Dependencies**

The data types of the numerator and denominator coefficients can be different, but the length of the numerator vector and the full denominator vector must be the same.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**y — Output signal**

Scalar | Vector

Output signal, specified as a scalar or vector.

The block automatically selects the data types and scalings of the output and any temporary variables.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus
Parameters

**Initial condition — Initial condition**
0.0 (default) | scalar

Specify the initial condition as a scalar.

**Programmatic Use**

Transfer Fcn First Order

Implement discrete-time first order transfer function
Library: Simulink / Discrete

Description

The Transfer Fcn First Order block implements a discrete-time first order transfer function of the input. The transfer function has a unity DC gain.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal to the first order transfer function algorithm.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

Port_1 — Transfer function output signal
scalar | vector

Output signal that is the discrete-time first order transfer function of the input with a unity DC gain.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point
Parameters

Pole (in Z plane) — Pole
0.95 (default) | scalar

Specify the pole.

Programmatic Use
Block Parameter: PoleZ
Type: character vector
Value: real scalar
Default: ’0.95’

Initial condition for previous output — Initial condition for previous output
0.0 (default) | scalar

Specify the initial condition for the previous output.

Programmatic Use
Block Parameter: ICPrevOutput
Type: character vector
Value: real scalar
Default: ’0.0’

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: ’Ceiling’ | ’Convergent’ | ’Floor’ | ’Nearest’ | ’Round’ | ’Simplest’ | ’Zero’
Default: ’Floor’

Transfer Fcn | Transfer Fcn Lead or Lag

Introduced before R2006a
Transfer Fcn Lead or Lag

Implement discrete-time lead or lag compensator

Library: Simulink / Discrete

Description

The Transfer Fcn Lead or Lag block implements a discrete-time lead or lag compensator of the input. The instantaneous gain of the compensator is 1, and the DC gain is equal to \((1 - z)/(1 - p)\), where \(z\) is the zero and \(p\) is the pole of the compensator.

The block implements a lead compensator when \(0 < z < p < 1\), and implements a lag compensator when \(0 < p < z < 1\).

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block applies the discrete-time lead or lag compensation to.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Port_1 — Output signal
scalar | vector

Output signal that is discrete-time lead or lag compensation of the input signal.
Parameters

Pole of compensator (in Z plane) — Pole

Specify the pole of the compensator.

Programmatic Use

Block Parameter: PoleZ

Type: character vector

Value: real scalar

Default: '0.95'

Zero of compensator (in Z plane) — Zero of compensator

Specify the zero of compensator in the Z plane.

Programmatic Use

Block Parameter: ZeroZ

Type: character vector

Value: real scalar

Default: '0.75'

Initial condition for previous output — Initial condition for previous output

Specify the initial condition for the previous output.

Programmatic Use

Block Parameter: ICPrevOutput

Type: character vector

Value: real scalar

Default: '0.0'

Initial condition for previous input — Initial condition for previous input

Specify the initial condition for the previous input.

Programmatic Use

Block Parameter: ICPrevInput

Type: character vector

Value: real scalar

Default: '0.0'
Specify the initial condition for the previous input.

**Programmatic Use**
**Block Parameter**: ICPrevInput
**Type**: character vector
**Value**: real scalar
**Default**: '0.0'

**Initial condition for previous output** — Initial condition for previous output
0.0 (default) | scalar

Port_1 — Output signal
scalar | vector

Output signal that is the discrete-time transfer function with a real zero and effectively no pole of the input signal.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
Parameters

Zero (in Z plane) — Zero
0.75 (default) | scalar

Specify the zero in the Z plane.

Programmatic Use

Block Parameter: ZeroZ
Type: character vector
Value: real scalar
Default: '0.75'

Initial condition for previous input — Initial condition for previous input
0.0 (default) | scalar

Specify the initial condition for the previous input.

Programmatic Use

Block Parameter: ICPrevInput
Type: character vector
Value: real scalar
Default: '0.0'

Input processing — Specify sample- or frame-based processing
Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- Columns as channels (frame based) — Treat each column of the input as a separate channel (frame-based processing).

Note Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- Elements as channels (sample based) — Treat each element of the input as a separate channel (sample-based processing).
Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input \( u \). All other input signals must be sample-based.

<table>
<thead>
<tr>
<th>Input Signal ( u )</th>
<th>Input Processing Mode</th>
<th>Block Works?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample based</td>
<td>Sample based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>No, produces an error</td>
</tr>
<tr>
<td>Sample based</td>
<td>Frame based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

**Programmatic Use**

**Block Parameter:** InputProcessing  
**Type:** character vector  
**Values:** 'Columns as channels (frame based)' | 'Elements as channels (sample based)'  
**Default:** 'Elements as channels (sample based)'

**Integer rounding mode — Rounding mode for fixed-point operations**

Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

**Programmatic Use**

**Block Parameter:** RndMeth  
**Type:** character vector  
**Values:** 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'  
**Default:** 'Floor'

**Saturate to max or min when overflows occur — Method of overflow action**

off (default) | on
When you select this check box, overflows saturate to the maximum or minimum value that the data type can represent. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

**Programmatic Use**

**Block Parameter:** `DoSatur`

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

Transport Delay

Delay input by given amount of time
Library: Simulink / Continuous

Description

The Transport Delay block delays the input by a specified amount of time. You can use this block to simulate a time delay. The input to this block should be a continuous signal.

At the start of simulation, the block outputs the Initial output parameter until the simulation time exceeds the Time delay parameter. Then, the block begins generating the delayed input. During simulation, the block stores input points and simulation times in a buffer. You specify this size with the Initial buffer size parameter.

When you want output at a time that does not correspond to times of the stored input values, the block interpolates linearly between points. When the delay is smaller than the step size, the block extrapolates from the last output point, which can produce inaccurate results. Because the block does not have direct feedthrough, it cannot use the current input to calculate an output value. For example, consider a fixed-step simulation with a step size of 1 and the current time at t = 5. If the delay is 0.5, the block must generate a point at t = 4.5. Because the most recent stored time value is at t = 4, the block performs forward extrapolation.

The Transport Delay block does not interpolate discrete signals. Instead, the block returns the discrete value at the required time.

This block differs from the Unit Delay block, which delays and holds the output on sample hits only.

Tip Avoid using linmod to linearize a model that contains a Transport Delay block. For more information, see “Linearizing Models”.

1-2166
Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Input signal to delay, specified as a scalar, vector, or matrix.
Data Types: double

Output

Port_1 — Delayed signal
scalar | vector | matrix

Input signal, delayed by specified amount of time. Output has the same dimensions and data type as the input signal.
Data Types: double

Parameters

Time delay — Time delay
1 (default) | scalar | vector | matrix

Specify the amount of simulation time to delay the input signal before propagation to the output as a nonnegative scalar, vector, or matrix.

Programmatic Use:
Block Parameter: DelayTime
Type: character vector, string
Values: nonnegative scalar, vector, or matrix
Default: '1'

Initial output — Initial output value
0 (default) | scalar | vector | matrix

Specify the output that the block generates until the simulation time first exceeds the time delay input as a scalar, vector, or matrix.
Limitations

The initial output of this block cannot be inf or NaN.

A Run-to-run tunable parameter cannot be changed during a simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: InitialOutput
Type: character vector, string
Values: scalar | vector | matrix
Default: '0'

Initial buffer size — Initial memory allocation
1024 (default) | positive integer scalar

Define the initial memory allocation for the number of input points to store.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message shows the total buffer size needed.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block can use a large amount of memory, particularly for dimensionalized input.

Programmatic Use

Block Parameter: BufferSize
Type: character vector, string
Value: positive integer scalar
Default: '1024'

Use fixed buffer size — Use fixed-size buffer
off (default) | on

Select this check box to use a fixed-size buffer to save input data from previous time steps.
The **Initial buffer size** parameter specifies the size of the buffer. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

**Note** If you have a Simulink Coder license, ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

**Tips**

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so can yield inaccurate results.

**Programmatic Use**

**Block Parameter:** FixedBuffer  
**Type:** character vector, string  
**Value:** 'off' | 'on'  
**Default:** 'off'

**Direct feedthrough of input during linearization — Enable direct feedthrough**

off (default) | on

Cause the block to output its input during linearization and trim, which sets the block mode to direct feedthrough.

**Tips**

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions linmod, dlinmod, or trim. To extract this new state ordering:
  1. Compile the model using the following command, where model is the name of the Simulink model.

     ```
     [sizes, x0, x_str] = model([],[],[],'lincompile');
     ```

  2. Terminate the compilation with the following command.

     ```
     model([],[],[],'term');
     ```

- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the
linmod, dlinmod, or trim functions, the state vector must use this new state ordering.

**Programmatic Use**
**Block Parameter:** TransDelayFeedthrough  
**Type:** character vector, string  
**Value:** 'off' | 'on'  
**Default:** 'off'

**Pade order (for linearization) — Order of Pade approximation**  
0 (default) | scalar | vector | matrix

Set the order of the Pade approximation for linearization routines as a scalar, vector, or matrix of nonnegative integers.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer \( n \) adds \( n \) states to your model, but results in a more accurate linear model of the transport delay.

**Programmatic Use**  
**Block Parameter:** PadeOrder  
**Type:** character vector, string  
**Values:** scalar | vector | matrix  
**Default:** '0'

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Trigger

Add trigger or function port to subsystem or model

Library:  
- Simulink / Ports & Subsystems
- HDL Coder / Ports & Subsystems

Description

The Trigger block adds an external signal to control the execution of a subsystem or a model. To enable this functionality, add this block to a Subsystem block or at the root level of a model that is referenced in a Model block.

Then, configure the Trigger block to execute a subsystem or model:

- Once at each time step, when the value of the control signal changes in a way that you specify.
- Multiple times during a time step, when the control signal is a function-call event from a Stateflow chart, Function-Call Generator block, or S-Function block.

Ports

Output

Control signal — External control signal to a subsystem or model
scalar

Control signal (trigger or function-call) attached externally to the outside of an Subsystem block or a Model block that is passed to the inside of the block. To enable this port, select Show output port.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | expression
Parameters

Main

**Trigger type — Select the type control signal**

*rising* (default) | *falling* | *either* | *function-call*

Select the type of control signal that executes a subsystem or model.

**rising**
Triggers execution of subsystem or model when the control signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.

**falling**
Triggers execution of subsystem or model when the control signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.

**either**
Triggers execution of subsystem or model when the control signal is either rising or falling.

**function-call**
Execute subsystem or model when the control signal receives a function-call event from a Stateflow chart, Function-Call Generator block, or an S-function block.

**Programmatic Use**

**Block Parameter:** TriggerType  
**Type:** character vector  
**Values:** 'rising' | 'falling' | 'either' | 'function-call'  
**Default:** 'rising'

**Treat as Simulink function — Create Simulink Function block**

*off* (default) | *on*

Create a Simulink Function block by configuring a Subsystem block that is callable with arguments from a function caller:

- **off**
  Remove configuration.
Configure a Subsystem block as a Simulink Function block. The Trigger block must reside within the subsystem.

You can edit the function prototype that displays on the block face to specify input and output arguments for the block.

**Dependency**

To display and enable this parameter, select function-call from the **Trigger type** list.

**Programmatic Use**

**Block Parameter:** IsSimulinkFunction  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Function name — Specify function name for Simulink Function block**  
**f** (default) | function name

Specify the function name for a Simulink Function block. Alternatively, you can specify the name by editing the function prototype on the face of the block.

**f**

Default name for a Simulink Function block.

**function name**

Function name that displays on the face of a Simulink Function block.

**Dependency**

To display and enable this parameter, select function-call from the **Trigger type** list and select the **Treat as a Simulink Function** check box.

**Programmatic Use**

**Block Parameter:** FunctionName  
**Type:** character vector  
**Values:** 'f' | '<function name>'  
**Default:** 'f'

**Enable variant condition — Controls activating the variant control (condition)**  
on (default) | off
Control activating the variant control (condition) defined with the **Variant Control** parameter.

- **off**
  Deactivate variant control of subsystem.

- **on**
  Activate variant control of subsystem. Selecting this parameter:
  - Enables the **Variant control** parameter.
  - Displays a variant badge on the face of the block indicating variant conditions are enabled.

**Dependency**

To display and enable this parameter, select function-call from the **Trigger type** list and select the **Treat as a Simulink Function** check box.

**Programmatic Use**

**Block Parameter:** Variant  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Variant control — Specify variant control (condition) expression**

**(inherit)** (default) | <logical expression>

Specify variant control (condition) expression that executes a variant Simulink Function block when the expression evaluates to true.

**(inherit)**

Default value for variant control. Inherits the variant condition from the corresponding Function Caller blocks in the model. When **Variant Control** is set as **(inherit)** the value for **Generate preprocessor conditionals** is inherited automatically from the Function Caller block in the model.

**logical expression**

A logical (Boolean) expression or a Simulink.Variant object representing a logical expression.

The function is activated when the expression evaluates to true.
If you want to generate code for your model, define the variables in the expression as Simulink.Parameter objects.

**Dependency**

To display and enable this parameter, select function-call from the Trigger type list, select the Treat as a Simulink Function check box and then select the Enable variant condition check box.

**Programmatic Use**

**Block Parameter:** VariantControl  
**Type:** character vector  
**Values:** '(inherit)|<logical expression>|Simulink.Variant object  
**Default:** '(inherit)'

**Generate preprocessor conditionals — Control enclosing variant choices**

off (default) | on

Control enclosing variant choices within C preprocessor conditional statements.

- **off**
  - Do not enclose variant choices within C preprocessor conditional statements.

- **on**
  - When generating code for an ERT target, enclose variant choices within C preprocessor conditional statements (#if).

**Dependency**

To display and enable this parameter, select the Enable variant condition check box.

**Programmatic Use**

**Block Parameter:** GeneratePreprocessorConditionals  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Function visibility — Select scope visibility of function**

scoped (default) | global

Select scope of Simulink Function block within subsystem or model.
scoped
  Limit accessibility of function to:
  • Hierarchic level containing the Simulink Function block and levels below.
  • One hierarchical level above with qualification.

global
  Function accessible from any part of the model hierarchy.

Dependency
To display and enable this parameter, select function-call from the Trigger type list and then select the Treat as a Simulink Function check box..

Programmatic Use
Block Parameter: FunctionVisibility
  Type: character vector
  Values: 'scoped' | 'global'
  Default: 'scoped'

States when enabling — Select how to set block state values
held (default) | reset | inherit
Select how to set block state values when the subsystem or model is disabled.

held
  Leave the block states at their current values.
reset
  Reset the block state values.
inherit
  Use the held or reset setting from the parent subsystem initiating the function-call. If the parent of the initiator is the model root, the inherited setting is held. If the trigger has multiple initiators, set the parents of all initiators to either held or reset.

Dependencies
To enable this parameter, select function-call from the Trigger Type list.
This parameter setting applies only if the model explicitly enables and disables the function-call subsystem. For example:
• The function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the parent subsystem.

• The function-call initiator that controls the function-call subsystem resides in an enabled subsystem. In this case, the model enables and disables the function-call subsystem along with the enabled subsystem containing the function-call initiator.

• The function-call initiator is a Stateflow event bound to a particular state. See “Control Function-Call Subsystems by Using bind Actions” (Stateflow).

• The function-call initiator is an S-function that explicitly enables and disables the function-call subsystem. See `ssEnableSystemWithTid` for an example.

**Programmatic Use**

**Block Parameter:** StatesWhenEnabling

**Type:** character vector

**Values:** 'held' | 'reset' | 'inherit'

**Default:** 'held'

**Propagate sizes of variable-size signals — Select when to propagate variable-size signals**

**During execution** (default) | **Only when enabling**

Select when to propagate variable-size signals.

**During execution**

Propagate variable-size signals at each time step.

**Only when enabling**

Propagate variable-size signals when executing a Subsystem block or Model block containing an Enable port, Trigger port with Trigger type set to function-call, or Action Port block. When you select this option, sample time must be periodic.

**Dependencies**

To display and enable this parameter for a Trigger port block, select Function-call from the Trigger type list.

**Programmatic Use**

**Block Parameter:** PropagateVarSize

**Type:** character vector

**Values:** 'During execution' | 'Only when enabling'

**Default:** 'During execution'
Show output port — Control display of output port
off (default) | on

Control display of an output port for a signal that identifies the trigger signal or function-call event signal.

- off
  Remove the output port.

- on
  Display the output port and determine which signal caused the trigger signal or function-call event. The width of the output port signal is the width of the control signal. The signal value is:
  
  - 1 for a signal that causes a rising trigger
  - -1 for a signal that causes a falling trigger
  - 2 for a function-call event
  - 0 in all other cases

Programmatic Use

Block Parameter: ShowOutputPort
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Output data type — Select output port data type
auto (default) | double | int8

Select output port data type for the signal that identifies the trigger signal or function-call event signal.

- auto
  Data type is the same as the port connected to the output.

- double
  Double value.

- int8
  Integer value
**Dependency**

To enable this parameter, select the **Show output port** check box.

The Trigger block ignores the **Data type override** setting for the Fixed-Point Tool.

**Programmatic Use**

**Block Parameter**: OutputDataType

**Type**: character vector

**Values**: 'auto' | 'double' | 'int8'

**Default**: 'auto'

**Sample time type — Select calling rate**

triggered (default) | periodic

Select the calling rate for a subsystem or model.

**triggered**

Apply to applications that do not have a periodic function-call frequency. A function-call initiator can execute a triggered (aperiodic) function-call subsystem one or more times per time step and can provide a series of aperiodic function-call events.

**periodic**

A function-call initiator can execute a periodic function-call system only once per time step and must provide a series of periodic function-call events. A Stateflow chart is an example of a function-call initiator.

**Dependency**

To enable this parameter, select **Function-call** from the **Trigger type** list.

**Programmatic Use**

**Block Parameter**: SampleTimeType

**Type**: character vector

**Values**: 'triggered' | 'periodic'

**Default**: 'triggered'

**Sample time — Specify time interval**

-1 (default) | Ts | [Ts, To]

Specify the time interval between function calls to a subsystem or model containing this Trigger port block. If the actual calling rate for the subsystem or model differs from the time interval this parameter specifies, Simulink displays an error.
Inherit time interval from the control signal.

**Ts**
Scalar where Ts is the time interval.

**[Ts, To]**
Vector where Ts is the time interval and To is the initial time offset.

**Dependencies**
To enable this parameter, select function-call from the Trigger type list and periodic from the Sample time type list.

**Programmatic Use**
**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** '-1' | 'Ts' | '[Ts, To]'  
**Default:** '-1'

**Enable zero-crossing detection — Control zero-crossing detection**

on (default) | off

Control .

on
Detect zero crossings.

off
Do not detect zero crossings.

**Dependencies**
To enable this parameter, select rising, falling, or either from the Trigger type list.

**Programmatic Use**
**Block Parameter:** ZeroCross  
**Type:** character vector  
**Values:** 'on' | 'off'  
**Default:** 'on'
Initial trigger signal state — Select the initial state of the trigger signal
compatibility (no trigger on first evaluation) (default) | zero | positive | negative

Select the initial state of the trigger control signal.

compatibility (no trigger on first evaluation)
   No trigger at the first evaluation of trigger signal. If you choose this option and the
   Trigger block is in a subsystem where the states are reset, the block does not reset.
zero
   Zero. Helps to evaluate a rising or falling trigger signal at the first time step.
positive
   Positive value. Helps to evaluate a falling trigger signal at the first time step.
negative
   Negative value. Helps to evaluate a rising trigger signal at the first time step.

Dependency

To display and activate this parameter, select rising, falling, or either from the
Trigger type list.

Programmatic Use
Block Parameter: InitialTriggerSignalState
Type: character vector
Values: 'compatibility (no trigger on first evaluation)' | 'zero' | 'positive' | 'negative'
Default: 'compatibility (no trigger on first evaluation)'

Signal Attribute

Port dimensions — Specify dimensions for the trigger signal
1 (default) | [n] | [m n]

Specify dimensions for the trigger signal attached externally a Model block and passed to
the inside of the block.

1
   Scalar signal.
[n]
   Vector signal of width n.

[m n]
   Matrix signal having m rows and n columns.

**Dependency**

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

**Programmatic Use**

*Block Parameter*: PortDimensions

*Type*: character vector

*Values*: '1' | '[n]' | '[m n]'  

*Default*: '1'

**Trigger signal sample time — Specify time interval**

-1 (default) | Ts | [Ts, To]

Specify time interval between block method executions for the block driving the trigger signal.

-1
   Inherit time interval.

Ts
   Scalar where Ts is the time interval.

[Ts, To]
   Vector where Ts is the time interval and To is the initial time offset.

**Dependency**

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

**Programmatic Use**

*Block Parameter*: TriggerSignalSampleTime

*Type*: character vector

*Values*: '-1' | 'Ts' | '[Ts, To]'  

*Default*: '-1'
**Minimum — Specify minimum output value for the trigger signal**

[] (default) | real scalar

Specify minimum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Signal Ranges”.
- Automatic scaling of fixed-point data types.
- Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Simulink Coder).

[]

Unspecified minimum value.
real scalar
  Real scalar value.

**Dependency**

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

**Programmatic Use**

**Block Parameter:** OutMin  
**Type:** character vector  
**Values:** '[]' | '<real scalar>'  
**Default:** '[]'

**Maximum — Specify maximum output value for the trigger signal**

[] (default) | real scalar

Specify maximum value for the trigger signal attached externally to a Model block and passed to the inside of the block.

Simulink uses this value to perform:

- Simulation range checking. See “Signal Ranges”.
- Automatic scaling of fixed-point data types.
• Optimization of generated code. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. See “Optimize using the specified minimum and maximum values” (Simulink Coder).

[]

Unspecified maximum value.
real scalar
  Real scalar value.

**Dependency**

To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the **Trigger type** list.

**Programmatic Use**

**Block Parameter:** OutMax  
**Type:** character vector  
**Values:** '[]' | '<real scalar>'  
**Default:** '[]'

**Data type — Select output data type for the trigger signal**

double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32 | int64 | uint64 | boolean | fixdt(1,16) | fixdt(1,16,0) | fixdt(1,16,2^,0) | <data type expression>

Select data type for the trigger signal attached externally to a Model block and passed to the inside of the block.

double
  Double-precision floating point.
single
  Single-precision floating point.
int8
  Signed 8-bit integer.
uint8
  Unsigned 8-bit integer.
int16
  Signed 16-bit integer.
uint16
  Unsigned 16-bit integer.
int32
  Signed 32-bit integer.
uint32
  Unsigned 32-bit integer.
int64
  Signed 64-bit integer.
uint64
  Unsigned 64-bit integer.
boolean
  Boolean with a value of true or false.
fixdt(1,16)
  Signed 16-bit fixed point number with binary point undefined.
fixdt(1,16,0)
  Signed 16-bit fixed point number with binary point set to zero.
fixdt(1,16,2^0,0)
  Signed 16-bit fixed point number with slope set to 2^0 and bias set to 0.
<data type expression>
  Data type object, for example Simulink.NumericType. Do not specify a bus object as the expression.

Dependency
To display and enable this parameter for a Trigger port block at the root-level of a model, select rising, falling, or either from the Trigger type list.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32' | 'int64' | 'uint64' | 'boolean' | 'fixdt(1,16)' | 'fixdt(1,16,0)' | 'fixdt(1,16,2^0,0)' | '<data type expression>'
Default: 'double'
**Mode — Select data type category**  
**Build in (default) | Fixed point | Expression**

Select data type category and display drop-down lists to help you define the data type.

- **Build in**
  Display drop-down lists for data type and **Data type override**.
- **Fixed point**
  Display drop-down lists for **Signedness**, **Scaling**, and **Data type override**.
- **Expression**
  Display text box for entering an expression.

**Dependency**

To enable this parameter, select the Show data type assistant button.

**Programmatic Use**

No equivalent command-line parameter.

**Interpolate data — Control how missing workspace data is estimated**  
**on (default) | off**

Control how missing workspace data is estimated when loading data from the MATLAB workspace.

- **on**
  Linearly interpolate output at time steps for which no corresponding workspace data exists.
- **off**
  Do not interpolate output at time steps. The current output equals the output at the most recent time step for which data exists.

**Dependency**

To display and enable this parameter for a Trigger port block at the root-level of a model, select **rising**, **falling**, or **either** from the **Trigger type** list.
Programmatic Use

**Block Parameter**: Interpolate
**Type**: character vector
**Values**: 'on' | 'off'
**Default**: 'on'

Trigger-Based Linearization

Generate linear models in base workspace when triggered
Library: Simulink / Model-Wide Utilities

Description

When triggered, this block calls linmod or dlinmod to create a linear model for the system at the current operating point. No trimming is performed. The linear model is stored in the base workspace as a structure, along with information about the operating point at which the snapshot was taken. Multiple snapshots are appended to form an array of structures.

The block sets the following model parameters to the indicated values:

- BufferReuse = 'off'
- RTWInlineParameters = 'on'
- BlockReductionOpt = 'off'

The name of the structure used to save the snapshots is the name of the model appended by _Trigger_Based_Linearization, for example, vdp_Trigger_Based_Linearization. The structure has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>The A matrix of the linearization</td>
</tr>
<tr>
<td>b</td>
<td>The B matrix of the linearization</td>
</tr>
<tr>
<td>c</td>
<td>The C matrix of the linearization</td>
</tr>
<tr>
<td>d</td>
<td>The D matrix of the linearization</td>
</tr>
<tr>
<td>StateName</td>
<td>Names of the model's states</td>
</tr>
<tr>
<td>Field</td>

</tr>
<tr>
<td>InputName</td>
<td>Names of the model's input ports</td>
</tr>
<tr>
<td>OperPoint</td>
<td>A structure that specifies the operating point of the linearization. The structure specifies the value of the model's states (OperPoint.x) and inputs (OperPoint.u) at the operating point time (OperPoint.t).</td>
</tr>
<tr>
<td>Ts</td>
<td>The sample time of the linearization for a discrete linearization</td>
</tr>
</tbody>
</table>

**Tip** Use the Timed-Based Linearization block to generate linear models at predetermined times.

**Ports**

**Input**

**Port_1 — Input signal**

 scalar  

Input trigger signal specified as a scalar. You specify the type of event that triggers generation of a linear model using the **Trigger type** parameter.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | fixed point

**Parameters**

**Trigger type — Signal type that triggers generation of a linear model**

 rising | falling | either | function-call  

Type of event on the trigger input signal that triggers generation of a linear model. You can select:

- **rising** — Trigger execution of subsystem or model when the trigger signal rises from a negative or zero value to a positive value. If the initial value is negative, a rising signal to zero triggers execution.
- **falling** — Trigger execution of subsystem or model when the trigger signal falls from a positive or a zero value to a negative value. If the initial value is positive, a falling signal to zero triggers execution.

- **either** — Trigger execution of subsystem or model when the trigger signal is either rising or falling.

- **function-call** — Trigger execution of subsystem or model when the trigger signal is a function-call event from a Stateflow chart, Function-Call Generator block, or an S-Function.

**Programmatic Use**

**Block Parameter:** TriggerType  
**Type:** character vector  
**Values:** 'rising' | 'falling' | 'either' | 'function-call'  
**Default:** 'rising'

**Sample time (of linearized model) — Sample time**

0 (default) | scalar | vector

Specify a sample time for the linear model. To create a continuous-time model using linmod, specify a sample time of 0. Otherwise, to create a discrete-time model using dlinmod, specify a positive sample time (see “Discrete-Time System Linearization” on page 2-58).

**Programmatic Use**

**Block Parameter:** SampleTime  
**Type:** character vector  
**Values:** scalar | vector  
**Default:** '0'

Triggered Subsystem

Subsystem whose execution is triggered by external input

**Library:**
- Simulink / Ports & Subsystems
- HDL Coder / Ports & Subsystems

**Description**

The Triggered Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that executes each time the control signal has a trigger value.

Use Trigger Subsystem blocks to model:

- A task that runs with the detection of a trigger value.
- An interrupt from I/O hardware.
- A processor request to handle an exception or error.
Ports

Input

**In — Signal input to a subsystem block**

scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Trigger — Control signal input to a subsystem block**

scalar

Placing a Trigger block in a subsystem block adds an external input port to the block.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

**Out — Signal output from a subsystem**

scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

a. Actual data type or capability support depends on block implementation.

Extended Capabilities

C/C++ Code Generation
Generate C and C++ code using Simulink® Coder™.

Actual code generation support depends on block implementation.

HDL Code Generation
Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic. For information about best practices, restrictions, and how you can use the trigger signal as a clock with the TriggerAsClock property, see “Using Triggered Subsystems for HDL Code Generation” (HDL Coder).
### HDL Architecture

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module (default)</td>
<td>Generate code for the subsystem and the blocks within the subsystem.</td>
</tr>
<tr>
<td>BlackBox</td>
<td>Generate a black box interface. The generated HDL code includes only the input/output port definitions for the subsystem. Therefore, you can use a subsystem in your model to generate an interface to existing, manually written HDL code. The black-box interface generation for subsystems is similar to the Model block interface generation without the clock signals.</td>
</tr>
<tr>
<td>No HDL</td>
<td>Remove the subsystem from the generated code. You can use the subsystem in simulation, however, treat it as a “no-op” in the HDL code.</td>
</tr>
</tbody>
</table>

### Black Box Interface Customization

For the BlackBox architecture, you can customize port names and set attributes of the external component interface. See “Customize Black Box or HDL Cosimulation Interface” (HDL Coder).

### HDL Block Properties

<table>

</tr>
</tbody>
</table>

**CORDIC Approximation Method**

If you use the CORDIC approximation method (see “More About” on page 1-2211), the block input has some further requirements.

When you set **Function** to sin, cos, sincos, or cos + jsin, and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range \([-2\pi, 2\pi)\) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range \([0, 2\pi)\) rad.

When you set **Function** to atan2 and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
• Both inputs must have the same data type.
• When you use signed fixed-point types, the word length must be 126 or less.
• When you use unsigned fixed-point types, the word length must be 125 or less.

This table summarizes what happens for an invalid input.

<table>
<thead>
<tr>
<th>Block Usage</th>
<th>Effect of Invalid Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simulation</td>
<td>An error appears.</td>
</tr>
<tr>
<td>Generated code</td>
<td>Undefined behavior occurs. Avoid relying on undefined behavior for generated code or accelerator modes.</td>
</tr>
<tr>
<td>Accelerator modes</td>
<td></td>
</tr>
</tbody>
</table>

## Ports

### Input

**Port_1 — Input signal**

scalar | vector | matrix

Input specified as a scalar, vector, or matrix. The block accepts input signals of the following data types:

<table>
<thead>
<tr>
<th>Functions</th>
<th>Input Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>• sin</td>
<td>• Floating point</td>
</tr>
<tr>
<td>• cos</td>
<td>• Fixed point (only when Approximation method is CORDIC)</td>
</tr>
<tr>
<td>• sincos</td>
<td></td>
</tr>
<tr>
<td>• cos + jsin</td>
<td></td>
</tr>
<tr>
<td>• atan2</td>
<td></td>
</tr>
</tbody>
</table>
**Functions**

- tan
- asin
- acos
- atan
- sinh
- cosh
- tanh
- asinh
- acosh
- atanh

**Input Data Types**

- Floating point

**Dependencies**

- When you set Function to atan2, the block shows two input ports. The first input (Port_1) is the y-axis or imaginary part of the function argument. The second input (Port_2) is the x-axis or real part of the function argument.
- You can use floating-point input signals when you set Approximation method to None or CORDIC. However, the block output data type depends on which of these approximation method options you choose.

<table>
<thead>
<tr>
<th>Input Data Type</th>
<th>Approximation Method</th>
<th>Output Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Floating point</td>
<td>None</td>
<td>Depends on your selection for Output signal type. Options are auto (same data type as input), real, or complex.</td>
</tr>
<tr>
<td>Floating point</td>
<td>CORDIC</td>
<td>Same as input. Output signal type is not available when you use the CORDIC approximation method to compute the block output.</td>
</tr>
</tbody>
</table>

For CORDIC approximations:

- Input must be real for the sin, cos, sincos, cos + jsin, and atan2 functions.
• Output is real for the \( \sin, \cos, \text{sincos}, \) and \( \text{atan2} \) functions.
• Output is complex for the \( \cos + j\sin \) function.

**Limitations**

Complex input signals are supported for all functions in this block, except \( \text{atan2} \).

You can use fixed-point input signals only when **Approximation method** is set to **CORDIC**. The CORDIC approximation is available for the \( \sin, \cos, \text{sincos}, \cos + j\sin, \) and \( \text{atan2} \) functions. For the \( \text{atan2} \) function, the relationship between input and output data types depends also on whether the fixed-point input is signed or unsigned.

<table>
<thead>
<tr>
<th>Input Data Type</th>
<th>Function</th>
<th>Output Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed point, signed or unsigned</td>
<td>( \sin, \cos, \text{sincos}, ) and ( \cos + j\sin )</td>
<td>\text{fixdt}(1, WL, WL - 2) where WL is the input word length. This fixed-point type provides the best precision for the CORDIC algorithm.</td>
</tr>
<tr>
<td>Fixed point, signed</td>
<td>( \text{atan2} )</td>
<td>\text{fixdt}(1, WL, WL - 3)</td>
</tr>
<tr>
<td>Fixed point, unsigned</td>
<td>( \text{atan2} )</td>
<td>\text{fixdt}(1, WL, WL - 2)</td>
</tr>
</tbody>
</table>

When you set **Function** to \( \sin, \cos, \text{sincos}, \) or \( \cos + j\sin \), and set the **Approximation method** to **CORDIC**, the block has these limitations:

• When you use signed fixed-point types, the input angle must fall within the range \([ -2\pi, 2\pi) \) rad.
• When you use unsigned fixed-point types, the input angle must fall within the range \([ 0, 2\pi) \) rad.

When you set **Function** to \( \text{atan2} \) and the **Approximation method** to **CORDIC**, the block has these limitations:

• Inputs must be the same size, or at least one value must be a scalar value.
• Both inputs must have the same data type.
• When you use signed fixed-point types, the word length must be 126 or less.
• When you use unsigned fixed-point types, the word length must be 125 or less.

**Data Types:** single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
Port_2 — x-axis or real part of the function argument for atan2
scalar | vector | matrix

Input the x-axis or real part of the function argument for atan2. When you set Function to atan2, the block shows two input ports. The first input (Port_1) is the y-axis or imaginary part of the function argument. The second input (Port_2) is the x-axis or real part of the function argument. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.)

Dependencies

To enable this port, set Function to atan2.

Limitations

- Fixed-point input signals are supported only when you set Approximation method to CORDIC.
- When you set Function to atan2 and Approximation method to CORDIC:
  - Inputs must be the same size, or at least one value must be a scalar value.
  - Both inputs must have the same data type.
  - When you use signed fixed-point types, the word length must be 126 or less.
  - When you use unsigned fixed-point types, the word length must be 125 or less.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Port_1 — Specified trigonometric function of input
scalar | vector | matrix

Result of applying the specified trigonometric function to one or more inputs in rad. Each function supports:

- Scalar operations
- Element-wise vector and matrix operations

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point
**sin — Sine of input signal**  
scalar | vector | matrix

Sine of the input signal, in rad.

**Dependencies**

To enable this port, set **Function** to sincos.

**Limitations**

Fixed-point input signals are supported only when you set **Approximation method** to CORDIC.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**cos — Cosine of input signal**  
scalar | vector | matrix

Cosine of the input signal, in rad.

**Dependencies**

To enable this port, set **Function** to sincos.

**Limitations**

Fixed-point input signals are supported only when you set **Approximation method** to CORDIC.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

**Parameters**

**Function — Trigonometric function**

sin (default) | cos | tan | asin | acos | atan | atan2 | sinh | cosh | tanh | asinh | acosh | atanh | sincos | cos + jsin

Specify the trigonometric function. The name of the function on the block icon changes to match your selection.
Limitations

When you set **Function** to sin, cos, sincos, or cos + jsin, and set the **Approximation method** to CORDIC, the block has these limitations:

• When you use signed fixed-point types, the input angle must fall within the range \([-2\pi, 2\pi)\) rad.
• When you use unsigned fixed-point types, the input angle must fall within the range \([0, 2\pi)\) rad.

When you set **Function** to atan2 and the **Approximation method** to CORDIC, the block has these limitations:

• Inputs must be the same size, or at least one value must be a scalar value.
• Both inputs must have the same data type.
• When you use signed fixed-point types, the word length must be 126 or less.
• When you use unsigned fixed-point types, the word length must be 125 or less.

Programmatic Use

**Block Parameter:** Operator

**Type:** character vector

**Values:** 'sin' | 'cos' | 'tan' | 'asin' | 'acos' | 'atan' | 'atan2' | 'sinh' | 'cosh' | 'tanh' | 'asinh' | 'acosh' | 'atanh' | 'sincos' | 'cos + jsin'

**Default:** 'sin'

**Approximation method — CORDIC or none**

None (default) | CORDIC

Specify the type of approximation for computing output.

<table>
<thead>
<tr>
<th>Approximation Method</th>
<th>Data Types Supported</th>
<th>When to Use This Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>None (default)</td>
<td>Floating point</td>
<td>You want to use the default Taylor series algorithm.</td>
</tr>
<tr>
<td>CORDIC</td>
<td>Floating point and fixed point</td>
<td>You want a fast, approximate calculation.</td>
</tr>
</tbody>
</table>

If you select CORDIC and enlarge the block from the default size, the block icon changes:
<table>
<thead>
<tr>
<th>Function</th>
<th>Block Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>sin</td>
<td><img src="image" alt="Trigonometric Function" /></td>
</tr>
<tr>
<td>cos</td>
<td><img src="image" alt="Trigonometric Function" /></td>
</tr>
<tr>
<td>sincos</td>
<td><img src="image" alt="Trigonometric Function" /></td>
</tr>
<tr>
<td>cos + jsin</td>
<td><img src="image" alt="Trigonometric Function" /></td>
</tr>
<tr>
<td>atan2</td>
<td><img src="image" alt="Trigonometric Function" /></td>
</tr>
</tbody>
</table>

**Dependencies**

To enable this parameter, set **Function** to **sin**, **cos**, **sincos**, **cos + jsin**, or **atan2**.

To use fixed-point input signals, you must set **Approximation method** to CORDIC.
**Limitations**

When you set **Function** to \( \sin, \cos, \text{sincos}, \text{or cos} + j\sin \), and set the **Approximation method** to CORDIC, the block has these limitations:

- When you use signed fixed-point types, the input angle must fall within the range \([-2\pi, 2\pi)\) rad.
- When you use unsigned fixed-point types, the input angle must fall within the range \([0, 2\pi)\) rad.

When you set **Function** to \( \text{atan2} \) and the **Approximation method** to CORDIC, the block has these limitations:

- Inputs must be the same size, or at least one value must be a scalar value.
- Both inputs must have the same data type.
- When you use signed fixed-point types, the word length must be 126 or less.
- When you use unsigned fixed-point types, the word length must be 125 or less.

**Programmatic Use**

**Block Parameter:** ApproximationMethod

Type: character vector

**Values:** 'None' | 'CORDIC'

**Default:** 'None'

**Number of iterations** — Number of iterations for CORDIC algorithm

11 (default) | positive integer, less than or equal to word length of fixed-point input

Specify the number of iterations to perform the CORDIC algorithm. The default value is 11.

- When the block input uses a floating-point data type, the number of iterations can be a positive integer.
- When the block input is a fixed-point data type, the number of iterations cannot exceed the word length.

For example, if the block input is \( \text{fixdt}(1,16,15) \), the word length is 16. In this case, the number of iterations cannot exceed 16.

**Dependencies**

To enable this parameter, you must set the **Function** and **Approximation method** parameters as follows:
• Set **Function** to sin, cos, sincos, cos + jsin, or atan2.
• Set **Approximation method** to CORDIC.

**Programmatic Use**
**Block Parameter:** NumberOfIterations  
**Type:** character vector  
**Values:** positive integer, less than or equal to word length of fixed-point input  
**Default:** '11'

**Output signal type — complexity of output signal**
*auto* (default) | *real* | *complex*

Specify the output signal type of the Trigonometric Function block as *auto*, *real*, or *complex*.

<table>
<thead>
<tr>
<th>Function</th>
<th>Input Signal Type</th>
<th>Output Signal Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Auto</td>
</tr>
<tr>
<td>Any selection for the <strong>Function</strong> parameter</td>
<td>real</td>
<td>real</td>
</tr>
<tr>
<td></td>
<td>complex</td>
<td>complex</td>
</tr>
</tbody>
</table>

**Dependencies**

Setting **Approximation method** to CORDIC disables this parameter.

**Note** When **Function** is atan2, complex input signals are not supported for simulation or code generation.

**Programmatic Use**
**Block Parameter:** OutputSignalType  
**Type:** character vector  
**Values:** 'auto' | 'real' | 'complex'  
**Default:** 'auto'

**Sample time — Specify sample time as a value other than -1**
-1 (default) | scalar | vector

Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.
Dependencies

This parameter is not visible unless it is explicitly set to a value other than -1. To learn more, see “Blocks for Which Sample Time Is Not Recommended”.

Programmatic Use
Block Parameter: SampleTime
Type: character vector
Values: scalar or vector
Default: '-1'

a. This block supports fixed-point and base integer data types for 'Approximation method' CORDIC.

More About

CORDIC

CORDIC is an acronym for COordinate Rotation DIGital Computer. The Givens rotation-based CORDIC algorithm is one of the most hardware-efficient algorithms available because it requires only iterative shift-add operations (see References). The CORDIC algorithm eliminates the need for explicit multipliers. Using CORDIC, you can calculate various functions, such as sine, cosine, arc sine, arc cosine, arc tangent, and vector magnitude. You can also use this algorithm for divide, square root, hyperbolic, and logarithmic functions.
Increasing the number of CORDIC iterations can produce more accurate results, but doing so also increases the expense of the computation and adds latency.

References

Extended Capabilities

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Not all compilers support the asinh, acosh, and atanh functions. If you use a compiler that does not support those functions, a warning appears and the generated code fails to link.

**HDL Code Generation**

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.
**HDL Architecture**

You can generate HDL code for all functions of the block with single data types and architecture set to Trigonometric in native floating-point mode. The native floating-point mode does not support double data types for the block.

This block has multi-cycle implementations that introduce additional latency in the generated code. To see the added latency, view the generated model or validation model. See “Generated Model and Validation Model” (HDL Coder).

The Trigonometric Function block supports HDL code generation for these functions in this table with CORDIC approximation method and fixed-point data types.

</tr>
</thead>
<tbody>
<tr>
<td>HandleDenormals</td>
<td>Specify whether you want HDL Coder to insert additional logic to handle denormal numbers in your design. Denormal numbers are numbers that have magnitudes less than the smallest floating-point number that can be represented without leading zeros in the mantissa. The default is inherit. See also “HandleDenormals” (HDL Coder).</td>
</tr>
<tr>
<td>LatencyStrategy</td>
<td>Specify whether to map the blocks in your design to inherit, Max, Min, or Zero for the floating-point operator. The default is inherit. See also “LatencyStrategy” (HDL Coder).</td>
</tr>
<tr>
<td>MultiplyStrategy</td>
<td>Use this property for the sin, cos, tan, sincos, and cos+jsin functions. The default is inherit. Specify whether you want to use FullMultiplier or PartMultiplierPartAddShift. See also “MantissaMultiplyStrategy” (HDL Coder).</td>
</tr>
</tbody>
</table>

**Restrictions**

- For the sin and cos functions, only signed fixed-point data types are supported for CORDIC approximations.
- HDL Coder displays an error when you select these settings for a Trigonometric Function block inside a feedback loop:
  - HDL architecture as SinCosCordic
  - UsePipelinedKernel as On

The error occurs because the block is in a feedback loop and the code generator is unable to insert additional latency. To avoid this error, add a delay of length equal to the Number of iterations + 3 adjacent to the block. The code generator then absorbs this delay to meet the additional latency of the Trigonometric Function block.

For example, this Trigonometric Function block has Number of iterations set to 30. A Delay of length 33 adjacent to the block meets the additional latency.
PLC Code Generation
Generate Structured Text code using Simulink® PLC Coder™.

Fixed-Point Conversion
Design and simulate fixed-point systems using Fixed-Point Designer™.

This block supports fixed-point and base integer data types when you set the Function to sin, cos, sincos, cos + jsin, or atan2, and set the Approximation method to CORDIC.

Unary Minus

Negate input

Library:
- Simulink / Math Operations
- HDL Coder / HDL Floating Point Operations
- HDL Coder / Math Operations

Description

The Unary Minus block negates the input.

Ports

Input

Port_1 — Signal to negate
- scalar | vector | matrix | N-D array

Input signal, specified as a scalar, vector, matrix, or N-D array.

Data Types: single | double | int8 | int16 | int32 | fixed point

Output

Port_1 — Negation of input signal
- scalar | vector | matrix | N-D array

Negation of the input signal. The output has the same data type and dimensions as the input.

Data Types: single | double | int8 | int16 | int32 | fixed point
Parameters

Saturate on integer overflow — Method of overflow action

off (default) | on

Select to have integer overflows saturate. Otherwise, overflows wrap.

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. In general, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.

For signed-integer data types, the unary minus of the most negative value is not representable by the data type. In this case, the Saturate on integer overflow check box controls the behavior of the block:

<table>
<thead>
<tr>
<th>Parameter Setting</th>
<th>Block Behavior</th>
<th>Examples</th>
</tr>
</thead>
</table>
| Saturate on integer overflow = on | Values saturate to the most positive value of the integer data type | • For 8-bit signed integers, -128 maps to 127.  
• For 16-bit signed integers, -32768 maps to 32767.  
• For 32-bit signed integers, -2147483648 maps to 2147483647. |
| Saturate on integer overflow = off | Values wrap to the most negative value of the integer data type | • For 8-bit signed integers, -128 remains -128.  
• For 16-bit signed integers, -32768 remains -32768.  
• For 32-bit signed integers, -2147483648 remains -2147483648. |

Programmatic Use

Block Parameter: SaturateOnIntegerOverflow
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Sample time — Specify sample time as a value other than -1
-1 (default) | scalar | vector
Specify the sample time as a value other than -1. For more information, see “Specify Sample Time”.

**Dependencies**

Uniform Random Number

Generate uniformly distributed random numbers

Library: Simulink / Sources

Description

The Uniform Random Number block generates uniformly distributed random numbers over an interval that you specify. To generate normally distributed random numbers, use the Random Number block.

You can generate a repeatable sequence using any Uniform Random Number block with the same nonnegative seed and parameters. The seed resets to the specified value each time a simulation starts.

Avoid integrating a random signal, because solvers must integrate relatively smooth signals. Instead, use the Band-Limited White Noise block.

The numeric parameters of this block must have the same dimensions after scalar expansion. If you select the Interpret vector parameters as 1-D check box and the numeric parameters are row or column vectors after scalar expansion, the block outputs a 1-D signal. If you clear the Interpret vector parameters as 1-D check box, the block outputs a signal of the same dimensionality as the parameters.

Ports

Output

Port_1 — Random number output signal
scalar | vector

Output signal of generated uniformly distributed random numbers over the interval you specify.
Data Types: double

## Parameters

### Minimum — Minimum interval

Specify the minimum of the interval.

**Programmatic Use**

**Block Parameter:** Minimum  
**Type:** character vector  
**Values:** scalar  
**Default:** ' -1'

### Maximum — Maximum interval

Specify the maximum of the interval.

**Programmatic Use**

**Block Parameter:** Maximum  
**Type:** character vector  
**Values:** scalar  
**Default:** ' 1'

### Seed — Random number seed

Specify the starting seed for the random number generator.

The seed must be 0 or a positive integer. Output is repeatable for a given seed.

**Programmatic Use**

**Block Parameter:** See  
**Type:** character vector  
**Values:** scalar  
**Default:** ' 0'

### Sample time — Sample time

Sample time

0.1 (default) | scalar
Specify the time interval between samples. See “Specify Sample Time” in the Simulink documentation for more information.

**Programmatic Use**

**Block Parameter:** SampleTime

**Type:** character vector

**Values:** scalar

**Default:** '0.1'

**Interpret vector parameters as 1-D — Treat vectors as 1-D**

- Select this check box to output a vector of length \( N \) if the **Constant value** parameter evaluates to an \( N \)-element row or column vector.

  - When you select this check box, the block outputs a vector of length \( N \) if the **Constant value** parameter evaluates to an \( N \)-element row or column vector. For example, the block outputs a matrix of dimension 1-by-\( N \) or \( N \)-by-1.

  - When you clear this check box, the block does not output a vector of length \( N \) if the **Constant value** parameter evaluates to an \( N \)-element row or column vector.

**Programmatic Use**

**Block Parameter:** VectorParams1D

**Type:** character vector

**Values:** 'on' | 'off'

**Default:** 'on'

Unit System Configuration

Configure units
Library: Simulink / Ports & Subsystems

Description

The Unit System Configuration block specifies allowed and disallowed unit systems for the component. It restricts units systems for a subsystem or top model and all its children, unless you override it with another Unit System Configuration block in a child.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Parameters

Disallowed unit systems — Disallowed unit systems
SI | English | SI (extended) | CGS

Displays a list of the disallowed unit systems. By default, the Allow all unit systems check box is selected, and all unit systems are allowed.

To designate a unit system as disallowed, select it in the Allowed unit systems column and click << Disallow.

Dependencies

To enable changes to this parameter, you must first clear the Allow all unit systems check box.

Allowed unit systems — Allowed unit systems
SI | English | SI (extended) | CGS

Displays a list of the allowed unit systems. By default, the Allow all unit systems check box is selected, and all unit systems are allowed.
To designate a unit system as allowed, use the Allow >> and << Disallow buttons to move unit systems between the Disallowed unit systems and Allowed unit systems columns.

**Dependencies**

To enable changes to this parameter, you must first clear the Allow all unit systems check box.

**Programmatic Use**

**Block Parameter:** UnitSystems  
**Type:** cell array of character vectors  
**Values:** cell array of the following character vectors: 'SI' | 'English' | 'SI (extended)' | 'CGS'  
**Default:** {'SI', 'English', 'SI (extended)', 'CGS'}

**Allow all unit systems — Allow all unit systems**  
_on (default) | off_

When you select this check box, all unit systems are allowed. To restrict the allowed unit systems to only the ones specified in the Allowed unit systems column, clear this check box.

**Dependencies**

Selecting the Allow all unit systems check box disables the Disallowed unit systems and Allowed unit systems parameters.

**Programmatic Use**

**Block Parameter:** AllowAllUnitSystems  
**Type:** character vector  
**Values:** 'on' | 'off'  
**Default:** 'on'

**Introduced in R2016a**
Unit Conversion

Convert units

Library: Simulink / Signal Attributes

Description

The Unit Conversion block converts the unit of the input signal to the output signal. The block can perform the conversion if the units are separated by a scaling factor or offset, or are inverse units, for example:

- \( y = a \cdot U \)
- \( y = a \cdot U + b \), where \( a \) is the scale and \( b \) is the offset
- \( y = a/U \)

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal for unit conversion, specified as a scalar, vector, or matrix.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Port_1 — Output signal

scalar | vector | matrix
Output signal with converted units, specified as a scalar, vector, or matrix.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | fixed point

**Parameters**

**Output data type — Output data type**

*Inherit: Inherit via internal rule (default)* | *Inherit: Inherit via back propagation*

Specify the output data type.

- **Inherit: Inherit via internal rule** — Simulink chooses intermediate and output data types to balance numerical accuracy, performance, and generated code size, while accounting for the properties of the embedded target hardware. If you change the embedded target settings, the data type selected by the internal rule might change.

- **Inherit: Inherit via back propagation** — Output data type is inherited via back propagation. Internal rules determine the intermediate data types and Simulink casts the final results to the output data type.

**Programmatic Use**

**Block Parameter:** `OutDataTypeStr`

**Type:** character vector

**Values:** `'Inherit via internal rule'` | `'Inherit via back propagation'`

**Default:** `'Inherit via internal rule'`

**Block Characteristics**

Introduced in R2016a
Unit Delay

Delay signal one sample period
Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Unit Delay block holds and delays its input by the sample period you specify. When placed in an iterator subsystem, it holds and delays its input by one iteration. This block is equivalent to the $z^{-1}$ discrete-time operator. The block accepts one input and generates one output. Each signal can be scalar or vector. If the input is a vector, the block holds and delays all elements of the vector by the same sample period.

You specify the block output for the first sampling period with the Initial conditions parameter. Careful selection of this parameter can minimize unwanted output behavior. You specify the time between samples with the Sample time parameter. A setting of -1 means the block inherits the Sample time.

Note The Unit Delay block errors out if you use it to create a transition between blocks operating at different sample rates. Use the Rate Transition block instead.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.

This table shows recommended usage for each block.
Block | Purpose of the Block | Reference Examples
--- | --- | ---
Unit Delay | Implement a delay using a discrete sample time that you specify. The block accepts and outputs signals with a discrete sample time. | • sldemo_enginewc (Compression subsystem)

Memory on page 1-1278 | Implement a delay by one major integration time step. Ideally, the block accepts continuous (or fixed in minor time step) signals and outputs a signal that is fixed in minor time step. | • sldemo_bounce
• sldemo_clutch (Friction Mode Logic/Lockup FSM subsystem)

Zero-Order Hold | Convert an input signal with a continuous sample time to an output signal with a discrete sample time. | • sldemo_radar_eml
• aero_dap3dof

Each block has the following capabilities.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Memory</th>
<th>Unit Delay</th>
<th>Zero-Order Hold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specification of initial condition</td>
<td>Yes</td>
<td>Yes</td>
<td>No, because the block output at time t = 0 must match the input value.</td>
</tr>
<tr>
<td>Specification of sample time</td>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Support for state logging</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block delays by one sample period.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input delayed by one sample period.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Main

Initial condition — First sample period output
θ (default) | scalar | vector

Specify the output of the simulation for the first sampling period, during which the output of the Unit Delay block is otherwise undefined.

Programmatic Use
Block Parameter: InitialCondition
Type: character vector
Value: scalar | vector
Default: 'θ'

1-2234
**Input processing — Specify sample- or frame-based processing**

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- **Columns as channels (frame based)** — Treat each column of the input as a separate channel (frame-based processing).

**Note** Frame-based processing requires a DSP System Toolbox license.

For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- **Elements as channels (sample based)** — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input u. All other input signals must be sample-based.

<table>
<thead>
<tr>
<th>Input Signal u</th>
<th>Input Processing Mode</th>
<th>Block Works?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample based</td>
<td>Sample based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>No, produces an error</td>
</tr>
<tr>
<td>Sample based</td>
<td>Frame based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

**Programmatic Use**

**Block Parameter:** InputProcessing  
**Type:** character vector  
**Values:** 'Columns as channels (frame based)' | 'Elements as channels (sample based)'  
**Default:** 'Elements as channels (sample based)'

**Sample time (-1 for inherited) — Discrete interval between sample time hits**

-1 (default) | scalar
Enter the discrete interval between sample time hits or specify -1 to inherit the sample time.

See also “Specify Sample Time”.

**Programmatic Use**
**Block Parameter:** SampleTime  
**Type:** character vector  
**Value:** real scalar  
**Default:** '-1'

**State Attributes**

**State name — Unique name for block state**  
' ' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

- A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
- The state name applies only to the selected block.

This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

**Programmatic Use**
**Block Parameter:** StateName  
**Type:** character vector  
**Values:** unique name  
**Default:** ' '

**State name must resolve to Simulink signal object — Require state names resolve to signal object**  
**Off** (default) | **Boolean**
Specify if requiring that state name resolve to Simulink signal objects or not. If selected, the software generates an error at run time if you specify a state name that does not match the name of a Simulink signal object.

**Dependency**

Enabled when you give the parameter **State name** a value and set the model configuration parameter **Signal resolution** to a value other than **None**.

Selecting this check box disables **Code generation storage class**.

**Programmatic Use**

**Block Parameter:** StateMustResolveToSignalObject  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Signal object class — Custom storage class package name**

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select **Customize class lists**. For instructions, see “Target Class Does Not Appear in List of Signal Object Classes” (Embedded Coder).

For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

**Programmatic Use**

**Block Parameter:** StateSignalObject  
**Type:** character vector  
**Values:** 'Simulink.Signal' | '<StorageClass.PackageName>'  
**Default:** 'Simulink.Signal'

**Code generation storage class — Storage class for code generation**

Auto (default) | Model default | ExportedGlobal | ImportedExtern | ImportedExternPointer | Bitfield (Custom) | Volatile (Custom) |
Select state storage class for code generation. If you do not need to interface to external code, select Auto.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder) and “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

**Programmatic Use**

**Block Parameter:** StateStorageClass

**Type:** character vector

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.
Generated code relies on memcpy or memset functions (strong.h) under certain conditions.

**HDL Code Generation**

Generate Verilog and VHDL code for FPGA and ASIC designs using HDL Coder™.

HDL Coder provides additional configuration options that affect HDL implementation and synthesized logic.

**HDL Architecture**

This block has a single, default HDL architecture.

Delay | Resettable Delay

Introduced before R2006a
Variable Integer Delay

Delay input signal by variable sample period

Library: Simulink / Discrete

Description

The Variable Integer Delay block is a variant of the Delay block that has the source of the delay length set to Input port, by default.
Ports

Input

\( u \) — Data input signal
scalar | vector

Input data signal delayed according to parameters settings.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

\( d \) — Delay length
scalar

Delay length specified as inherited from an input port. Enabled when you select the Delay length: Source parameter as Input port.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Enable — External enable signal
scalar

Enable signal that enables or disables execution of the block. To create this port, select the Show enable port parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

External reset — External reset signal
scalar

External signal that resets execution of the block to the initial condition. To create this port, select the External reset parameter.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

\( x_0 \) — Initial condition
scalar | vector
Initial condition specified as inherited from an input port. Enabled when you select the Initial Condition: Source parameter as Input port.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input signal delayed by the length of time specified by the parameter Delay length. The initial value of the output signal depends on several conditions. See “Initial Block Output” on page 1-360.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Main

Delay length — Delay length
Dialog (default) | Input port

Specify whether to enter the delay length directly on the dialog box (fixed delay) or to inherit the delay from an input port (variable delay).

- If you set Source to Dialog, enter the delay length in the edit field under Value.
- If you set Source to Input port, verify that an upstream signal supplies a delay length for the input port. You can also specify its maximum value by specifying the parameter Upper limit.

Specify the scalar delay length as a real, non-negative integer. An out-of-range or non-integer value in the dialog box (fixed delay) returns an error. An out-of-range value from an input port (variable delay) casts it into the range. A non-integer value from an input port (variable delay) truncates it to the integer.
Programmatic Use

Block Parameter: DelayLengthSource
Type: character vector
Values: 'Dialog' | 'Input port'
Default: 'Dialog'

Block Parameter: DelayLength
Type: character vector
Values: scalar
Default: '2'

Block Parameter: DelayLengthUpperLimit
Type: character vector
Values: scalar
Default: '100'

Initial condition — Initial condition

Specify whether to enter the initial condition directly on the dialog box or to inherit the initial condition from an input port.

- If you set Source to Dialog, enter the initial condition in the edit field under Value.
- If you set Source to Input port, verify that an upstream signal supplies an initial condition for the x0 input port.

Simulink converts offline the data type of Initial condition to the data type of the input signal u using a round-to-nearest operation and saturation.

Note When State name must resolve to Simulink signal object is selected on the State Attributes pane, the block copies the initial value of the signal object to the Initial condition parameter. However, when the source for Initial condition is Input port, the block ignores the initial value of the signal object.

Programmatic Use

Block Parameter: InitialConditionSource
Type: character vector
Values: 'Dialog' | 'Input port'
Default: 'Dialog'

Block Parameter: InitialCondition
Type: character vector
**Values:** scalar  
**Default:** '0.0'

**Input processing — Specify sample- or frame-based processing**  
Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify whether the block performs sample- or frame-based processing:

- **Columns as channels (frame based)** — Treat each column of the input as a separate channel (frame-based processing).

  **Note**  
  Frame-based processing requires a DSP System Toolbox license.

  For more information, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

- **Elements as channels (sample based)** — Treat each element of the input as a separate channel (sample-based processing).

Use **Input processing** to specify whether the block performs sample- or frame-based processing. The block accepts frame-based signals for the input \( u \). All other input signals must be sample-based.

<table>
<thead>
<tr>
<th>Input Signal u</th>
<th>Input Processing Mode</th>
<th>Block Works?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample based</td>
<td>Sample based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>No, produces an error</td>
</tr>
<tr>
<td>Sample based</td>
<td>Frame based</td>
<td>Yes</td>
</tr>
<tr>
<td>Frame based</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

For more information about these two processing modes, see “Sample- and Frame-Based Concepts” (DSP System Toolbox).

**Programmatic Use**  
**Block Parameter:** InputProcessing  
**Type:** character vector  
**Values:** 'Columns as channels (frame based)' | 'Elements as channels (sample based)'  
**Default:** 'Elements as channels (sample based)'
**Use circular buffer for state — Circular buffer for storing state**

off (default) | on

Select to use a circular buffer for storing the state in simulation and code generation. Otherwise, an array buffer stores the state.

Using a circular buffer can improve execution speed when the delay length is large. For an array buffer, the number of copy operations increases as the delay length goes up. For a circular buffer, the number of copy operations is constant for increasing delay length.

If one of the following conditions is true, an array buffer always stores the state because a circular buffer does not improve execution speed:

- For sample-based signals, the delay length is 1.
- For frame-based signals, the delay length is no larger than the frame size.

**Programmatic Use**

Block Parameter: `UseCircularBuffer`

Type: character vector

Values: 'off' | 'on'

Default: 'off'

**Prevent direct feedthrough — Prevent direct feedthrough**

off (default) | on

Select to increase the delay length from zero to the lower limit for the **Input processing** mode:

- For sample-based signals, increase the minimum delay length to 1.
- For frame-based signals, increase the minimum delay length to the frame length.

Selecting this check box prevents direct feedthrough from the input port, \( u \), to the output port. However, this check box cannot prevent direct feedthrough from the initial condition port, \( x_0 \), to the output port.

**Dependency**

To enable this parameter, set **Delay length: Source** to **Input port**.

**Programmatic Use**

Block Parameter: `PreventDirectFeedthrough`

Type: character vector
Values: 'off' | 'on'
Default: 'off'

Remove delay length check in generated code — Remove delay length out-of-range check
off (default) | on

Select to remove code that checks for out-of-range delay length.

<table>
<thead>
<tr>
<th>Check Box</th>
<th>Result</th>
<th>When to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>Generated code does not include conditional statements to check for out-of-range delay length.</td>
<td>For code efficiency</td>
</tr>
<tr>
<td>Cleared</td>
<td>Generated code includes conditional statements to check for out-of-range delay length.</td>
<td>For safety-critical applications</td>
</tr>
</tbody>
</table>

Dependency

To enable this parameter, set **Delay length: Source** to **Input port**.

Programmatic Use

**Block Parameter**: RemoveDelayLengthCheckInGeneratedCode

**Type**: character vector

**Values**: 'off' | 'on'

**Default**: 'off'

Diagnostic for delay length — Diagnostic checks for delay length

None (default) | Warning | Error

Specify whether to produce a warning or error when the input d is less than the lower limit or greater than the **Delay length: Upper limit**. The lower limit depends on the setting for **Prevent direct feedthrough**.

- If the check box is cleared, the lower limit is zero.
- If the check box is selected, the lower limit is 1 for sample-based signals and frame length for frame-based signals.

Options for the diagnostic include:
- **None** — Simulink software takes no action.
- **Warning** — Simulink software displays a warning and continues the simulation.
- **Error** — Simulink software terminates the simulation and displays an error.

**Dependency**

To enable this parameter, set **Delay length:** **Source** to **Input** **port**.

**Programmatic Use**

**Block Parameter:** DiagnosticForDelayLength

**Type:** character vector

**Values:** 'None' | 'Warning' | 'Error'

**Default:** 'None'

**Show enable port — Create enable port**

**off** (default) | **on**

Select to control execution of this block with an enable port. The block is considered enabled when the input to this port is nonzero, and is disabled when the input is 0. The value of the input is checked at the same time step as the block execution.

**Programmatic Use**

**Block Parameter:** ShowEnablePort

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

**External reset — External state reset**

**None** (default) | **Rising** | **Falling** | **Either** | **Level** | **Level hold**

Specify the trigger event to use to reset the states to the initial conditions.

<table>
<thead>
<tr>
<th>Reset Mode</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>No reset</td>
</tr>
<tr>
<td>Rising</td>
<td>Reset on a rising edge</td>
</tr>
<tr>
<td>Falling</td>
<td>Reset on a falling edge</td>
</tr>
<tr>
<td>Either</td>
<td>Reset on either a rising or falling edge</td>
</tr>
</tbody>
</table>
Reset Mode | Behavior
---|---
Level | Reset in either of these cases:
  • When the reset signal is nonzero at the current time step
  • When the reset signal value changes from nonzero at the previous time step to zero at the current time step
Level hold | Reset when the reset signal is nonzero at the current time step

**Programmatic Use**

**Block Parameter:** ExternalReset
**Type:** character vector
**Values:** 'None' | 'Rising' | 'Falling' | 'Either' | 'Level' | 'Level hold'
**Default:** 'None'

**Sample time (-1 for inherited) — Discrete interval between sample time hits**
-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. This block supports discrete sample time, but not continuous sample time.

**Programmatic Use**

**Block Parameter:** SampleTime
**Type:** character vector
**Value:** real scalar
**Default:** ' -1'

**State Attributes**

**State name — Unique name for block state**
' ' (default) | alphanumeric string

Use this parameter to assign a unique name to the block state. The default is ' '. When this field is blank, no name is assigned. When using this parameter, remember these considerations:

• A valid identifier starts with an alphabetic or underscore character, followed by alphanumeric or underscore characters.
The state name applies only to the selected block. This parameter enables **State name must resolve to Simulink signal object** when you click **Apply**.

For more information, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder).

**Programmatic Use**
**Block Parameter:** `StateName`
**Type:** character vector
**Values:** unique name
**Default:** ''

**State name must resolve to Simulink signal object — Require state name resolve to a signal object**
**off** (default) | **on**

Select this check box to require that the state name resolves to a Simulink signal object.

**Dependencies**
To enable this parameter, specify a value for **State name**. This parameter appears only if you set the model configuration parameter **Signal resolution** to a value other than **None**.

Selecting this check box disables **Code generation storage class**.

**Programmatic Use**
**Block Parameter:** `StateMustResolveToSignalObject`
**Type:** character vector
**Values:** 'off' | 'on'
**Default:** 'off'

**Signal object class — Custom storage class package name**
**Simulink.Signal** (default) | `<StorageClass.PackageName>`

Choose a custom storage class package by selecting a signal object class that the target package defines. For example, to apply custom storage classes from the built-in package `mpt`, select `mpt.Signal`. Unless you use an ERT-based code generation target with Embedded Coder, custom storage classes do not affect the generated code.

If the class that you want does not appear in the list, select **Customize class lists**. For instructions, see “Target Class Does Not Appear in List of Signal Object Classes” (Embedded Coder).
For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

**Programmatic Use**

**Block Parameter:** StateSignalObject  
**Type:** character vector  
**Values:** 'Simulink.Signal' | '<StorageClass.PackageName>'  
**Default:** 'Simulink.Signal'

**Code generation storage class — State storage class for code generation**

Auto (default) | Model default | ExportedGlobal | ImportedExtern | ImportedExternPointer | BitField (Custom) | Model default | ExportToFile (Custom) | ImportFromFile (Custom) | FileScope (Custom) | AutoScope (Custom) | Struct (Custom) | GetSet (Custom) | Reusable (Custom)

Select state storage class for code generation.

- **Auto** is the appropriate storage class for states that you do not need to interface to external code.
- **StorageClass** applies the storage class or custom storage class that you select from the list. For information about storage classes, see “Apply Storage Classes to Individual Signal, State, and Parameter Data Elements” (Simulink Coder). For information about custom storage classes, see “Apply Built-In and Customized Storage Classes to Data Elements” (Embedded Coder).

Use **Signal object class** to select custom storage classes from a package other than Simulink.

**Dependencies**

To enable this parameter, specify a value for **State name**.

**Programmatic Use**

**Block Parameter:** StateStorageClass  
**Type:** character vector  
**Values:** 'Auto' | 'Model default' | 'ExportedGlobal' | 'ImportedExtern' | 'ImportedExternPointer' | 'Custom' | ...  
**Default:** 'Auto'

Variable Time Delay

Delay input by variable amount of time

Library: Simulink / Continuous

Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the Select delay type parameter. Use this parameter to specify the mode in which the block operates.

Variable Time Delay

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

\[ y(t) = u(t - t_0) = u(t - \tau(t)) \]

During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the Initial output parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is
smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of 1 and the current time at \( t = 5 \). If the delay is 0.5, the block must generate a point at \( t = 4.5 \), but the most recent stored time value is at \( t = 4 \). Thus, the block extrapolates the input at 4.5 from the input at 4 and uses the extrapolated value as its output at \( t = 5 \).

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

**Variable Transport Delay**

In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transport delay.

\[
y(t) = u(t - t_d(t))
\]

Simulink software finds the transport delay, \( t_d(t) \), by solving the following equation:

\[
\int_{t - t_d(t)}^{t} \frac{1}{t_i(\tau)} d\tau = 1
\]

This equation involves an instantaneous time delay, \( t_i(t) \), given by the time delay (bottom, or right) input.

Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

\[
t_i(t) = \frac{L}{v_i(t)}
\]
where $L$ is the length of the pipe and $v_i(t)$ is the speed of the fluid.

**Parameters**

**Select delay type — Type of delay**

Variable time delay | Variable transport delay

Specify the type of delay as Variable time delay or Variable transport delay.

The default value of this parameter depends on the block implementation: Variable time delay for the Variable Time Delay block, and Variable transport delay for the Variable Transport Delay block.

**Dependencies**

- Setting this parameter to Variable time delay enables the **Handle zero delay** parameter.
- Setting this parameter to Variable transport delay enables the **Absolute tolerance** and **State Name** parameters.

**Programmatic Use**

**Block Parameter:** VariableDelayType

Type: character vector, string

Values: 'Variable transport delay' | 'Variable time delay'

**Maximum delay — Maximum value of time delay input**

10 (default) | scalar | vector

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.

**Programmatic Use**

**Block Parameter:** MaximumDelay

Type: character vector, string

Value: scalar | vector

Default: '10'

**Initial output — Initial output**

0 (default) | scalar | vector
Specify the output that the block generates until the simulation time first exceeds the
time delay input.

**Dependencies**

- The initial output of this block cannot be inf or NaN.
- A Run-to-run tunable parameter cannot be changed during simulation run time.
  However, changing it before a simulation begins does not cause Accelerator or Rapid
  Accelerator to regenerate code.

**Programmatic Use**

**Block Parameter:** `InitialOutput`

**Type:** character vector, string

**Values:** scalar | vector

**Default:** '0'

**Initial buffer size — Initial memory allocation**

1024 (default) | scalar

Define the initial memory allocation for the number of input points to store. The input
points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates
  additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more
  memory must be allocated.

**Tips**

- Because allocating memory slows down simulation, choose this value carefully if
  simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for
  dimensionalized input.

**Programmatic Use**

**Block Parameter:** `MaximumPoints`

**Type:** character vector, string

**Values:** scalar | vector

**Default:** '1024'

**Use fixed buffer size — Use fixed-size buffer**

off (default) | on
Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The **Initial buffer size** parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

**Note** ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

**Tips**

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

**Programmatic Use**

**Block Parameter:** FixedBuffer  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Handle zero delay — Use direct feedthrough**

*off* (default) | *on*

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

**Dependencies**

To enable this parameter, set **Select delay type** to **Variable time delay**.

**Programmatic Use**

**Block Parameter:** ZeroDelay  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Direct feedthrough of input during linearization — Use direct feedthrough during linearization**

*off* (default) | *on*
When you select this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

**Tips**

- Selecting this check box can cause a change in the ordering of states in the model when you use the functions `linmod`, `dlinmod`, or `trim`. To extract this new state ordering:

  1. Compile the model using the following command, where `model` is the name of the Simulink model.
     
     ```
     [sizes, x0, x_str] = model([],[],[],'lincompile');
     ```
  2. Terminate the compilation with the following command.
     
     ```
     model([],[],[],'term');
     ```

- The output argument `x_str`, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the `linmod`, `dlinmod`, or `trim` functions, the state vector must use this new state ordering.

**Programmatic Use**

**Block Parameter:** TransDelayFeedthrough  
**Type:** character vector, string  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Pade order (for linearization) — Order of Pade approximation**

θ (default) | scalar

Set the order of the Pade approximation for linearization routines.

- The default value is 0, which results in a unity gain with no dynamic states.
- Setting the order to a positive integer n adds n states to your model, but results in a more accurate linear model of the transport delay.

**Programmatic Use**

**Block Parameter:** PadeOrder  
**Type:** character vector, string  
**Values:** scalar  
**Default:** 'θ'
**Absolute tolerance — Absolute tolerance for computing block state**

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

**Dependencies**

To enable this parameter, set **Select delay type** to Variable transport delay.

**Programmatic Use**

**Block Parameter:** AbsoluteTolerance  
**Type:** character vector, string  
**Values:** 'auto' | '-1' | any positive real scalar or vector  
**Default:** 'auto'

**State Name (e.g., 'position') — Unique name for each state**

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

**Tips**

- To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

**Dependencies**

To enable this parameter, set **Select delay type** to Variable transport delay.

**Programmatic Use**

**Block Parameter:** ContinuousStateAttributes
Type: character vector, string
Values: ' ' | user-defined character vector, user-defined string
Default: ' '

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Variable Transport Delay

Delay input by variable amount of time

**Library:** Simulink / Continuous

## Description

The Variable Transport Delay and Variable Time Delay blocks appear as two blocks in the Simulink block library. However, they are the same Simulink block with different settings for the **Select delay type** parameter. Use this parameter to specify the mode in which the block operates.

### Variable Transport Delay

In this mode, the block output at the current time step is equal to the value of its data (top, or left) input at an earlier time step equal to the current time minus a transport delay.

\[
y(t) = u(t - t_d(t))
\]

Simulink software finds the transport delay, \( t_d(t) \), by solving the following equation:

\[
\int_{t - t_d(t)}^{t} \frac{1}{t_i(\tau)} d\tau = 1
\]

This equation involves an instantaneous time delay, \( t_i(t) \), given by the time delay (bottom, or right) input.

![Variable Transport Delay Block Diagram](image)
Suppose that you want to use this block to model the fluid flow through a pipe where the fluid speed varies with time. In this case, the time delay input to the block is

\[ t_i(t) = \frac{L}{v_i(t)} \]

where \( L \) is the length of the pipe and \( v_i(t) \) is the speed of the fluid.

**Variable Time Delay**

In this mode, the block has a data input, a time delay input, and a data output. (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) The output at the current time step equals the value of its data input at a previous time step. This time step is the current simulation time minus a delay time specified by the time delay input.

\[ y(t) = u(t - t_0) = u(t - \tau(t)) \]

During the simulation, the block stores time and input value pairs in an internal buffer. At the start of simulation, the block outputs the value of the Initial output parameter until the simulation time exceeds the time delay input. Then, at each simulation step, the block outputs the signal at the time that corresponds to the current simulation time minus the delay time.

If you want the output at a time between input storing times and the solver is a continuous solver, the block interpolates linearly between points. If the time delay is smaller than the step size, the block extrapolates an output point from a previous point. For example, consider a fixed-step simulation with a step size of 1 and the current time at \( t = 5 \). If the delay is 0.5, the block must generate a point at \( t = 4.5 \), but the most recent stored time value is at \( t = 4 \). Thus, the block extrapolates the input at 4.5 from the input at 4 and uses the extrapolated value as its output at \( t = 5 \).

Extrapolating forward from the previous time step can produce a less accurate result than extrapolating back from the current time step. However, the block cannot use the
current input to calculate its output value because the input port does not have direct feedthrough.

If the model specifies a discrete solver, the block does not interpolate between time steps. Instead, it returns the nearest stored value that precedes the required value.

**Ports**

**Input**

**Port_1 — Input signal**

scalar | vector | matrix

Input signal specified as a scalar, vector, or matrix.

Data Types: double

**t₀ — Time delay input**

scalar | vector | matrix

Time delay input specified as a scalar, vector, or matrix. When the block is in **Variable time delay** mode, this value specifies the time delay. For more information about that calculation, see “Variable Time Delay” on page 1-2264.

**Dependencies**

To enable this port, set **Select delay type** to **Variable time delay**.

Data Types: double

**t₁ — Instantaneous time delay input**

scalar | vector | matrix

Instantaneous time delay input specified as a scalar, vector, or matrix. When the block is in **Variable transport delay** mode, this value is used to calculate the transport delay. For more information about that calculation, see “Variable Transport Delay” on page 1-2263.

**Dependencies**

To enable this port, set **Select delay type** to **Variable transport delay**.
Data Types: double

Output

Port_1 — Delayed signal
scalar | vector | matrix

Output signal specified as a scalar, vector, or matrix.

Data Types: double

Parameters

Select delay type — Type of delay
Variable time delay | Variable transport delay

Specify the type of delay as Variable time delay or Variable transport delay.

The default value of this parameter depends on the block implementation: Variable time delay for the Variable Time Delay block, and Variable transport delay for the Variable Transport Delay block.

Dependencies

- Setting this parameter to Variable time delay enables the Handle zero delay parameter.
- Setting this parameter to Variable transport delay enables the Absolute tolerance and State Name parameters.

Programmatic Use

Block Parameter: VariableDelayType
Type: character vector, string
Values: 'Variable transport delay' | 'Variable time delay'

Maximum delay — Maximum value of time delay input
10 (default) | scalar | vector

Set the maximum value of the time delay input. This value defines the largest time delay input that this block allows. The block clips any delay that exceeds this value. This value cannot be negative. If the time delay becomes negative, the block clips it to zero and issues a warning message.
Programmatic Use

Block Parameter: MaximumDelay
Type: character vector, string
Value: scalar | vector
Default: '10'

Initial output — Initial output

0 (default) | scalar | vector

Specify the output that the block generates until the simulation time first exceeds the time delay input.

Dependencies

- The initial output of this block cannot be inf or NaN.
- A Run-to-run tunable parameter cannot be changed during simulation run time. However, changing it before a simulation begins does not cause Accelerator or Rapid Accelerator to regenerate code.

Programmatic Use

Block Parameter: InitialOutput
Type: character vector, string
Values: scalar | vector
Default: '0'

Initial buffer size — Initial memory allocation

1024 (default) | scalar

Define the initial memory allocation for the number of input points to store. The input points define the history of the input signal up to the current simulation time.

- If the number of input points exceeds the initial buffer size, the block allocates additional memory.
- After simulation ends, a message displays if the buffer is not sufficient and more memory must be allocated.

Tips

- Because allocating memory slows down simulation, choose this value carefully if simulation speed is an issue.
- For long time delays, this block might use a large amount of memory, particularly for dimensionalized input.
Programmatic Use
Block Parameter: MaximumPoints
Type: character vector, string
Values: scalar | vector
Default: '1024'

Use fixed buffer size — Use fixed-size buffer
off (default) | on

Selecting this check box uses a fixed-size buffer to save input data from previous time steps. When you clear this check box, the block does not use a fixed-size buffer.

The Initial buffer size parameter specifies the buffer size. If the buffer is full, new data replaces data already in the buffer. Simulink software uses linear extrapolation to estimate output values that are not in the buffer.

**Note** ERT or GRT code generation uses a fixed-size buffer even if you do not select this check box.

**Tips**

- If the input data is linear, selecting this check box can save memory.
- If the input data is nonlinear, do not select this check box. Doing so might yield inaccurate results.

Programmatic Use
Block Parameter: FixedBuffer
Type: character vector, string
Values: 'off' | 'on'
Default: 'off'

Handle zero delay — Use direct feedthrough
off (default) | on

Selecting this check box converts this block to a direct feedthrough block. When you clear this check box, the block does not use direct feedthrough.

**Dependencies**

To enable this parameter, set **Select delay type** to **Variable time delay**.
Programmatic Use

Block Parameter: ZeroDelay
Type: character vector, string
Values: 'off' | 'on'
Default: 'off'

Direct feedthrough of input during linearization — Use direct feedthrough during linearization
off (default) | on

When you select this parameter, the block outputs its input during linearization and trim, which sets the block mode to direct feedthrough. To disable direct feedthrough, clear this check box.

Tips

• Selecting this check box can cause a change in the ordering of states in the model when you use the functions linmod, dlinmod, or trim. To extract this new state ordering:

  1 Compile the model using the following command, where model is the name of the Simulink model.

     \[\text{[sizes, x0, x_str]} = \text{model([],[],[],'lincompile')}\];

  2 Terminate the compilation with the following command.

     \text{model([],[],[],'term')};

• The output argument x_str, which is a cell array of the states in the Simulink model, contains the new state ordering. When you pass a vector of states as input to the linmod, dlinmod, or trim functions, the state vector must use this new state ordering.

Programmatic Use

Block Parameter: TransDelayFeedthrough
Type: character vector, string
Values: 'off' | 'on'
Default: 'off'

Pade order (for linearization) — Order of Pade approximation
0 (default) | scalar

Set the order of the Pade approximation for linearization routines.
• The default value is 0, which results in a unity gain with no dynamic states.
• Setting the order to a positive integer \( n \) adds \( n \) states to your model, but results in a more accurate linear model of the transport delay.

**Programmatic Use**

**Block Parameter:** PadeOrder  
**Type:** character vector, string  
**Values:** scalar  
**Default:** '0'

**Absolute tolerance — Absolute tolerance for computing block state**

auto (default) | positive, real, scalar or vector

Specify the absolute tolerance for computing the block state.

**Dependencies**

To enable this parameter, set **Select delay type** to Variable transport delay.

**Programmatic Use**

**Block Parameter:** AbsoluteTolerance  
**Type:** character vector, string  
**Values:** 'auto' | '-1' | any positive real scalar or vector  
**Default:** 'auto'

**State Name (e.g., 'position') — Unique name for each state**

' ' (default) | character vector, string

Assign a unique name to each state. If this field is blank, no name assignment occurs.

**Tips**

• To assign a name to a single state, enter the name between quotes, for example, 'velocity'.
• To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
• The state names apply only to the selected block.
• The number of states must divide evenly among the number of state names.
• You can specify fewer names than states, but you cannot specify more names than states.
For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.

**Dependencies**

To enable this parameter, set **Select delay type** to **Variable transport delay**.

**Programmatic Use**

**Block Parameter:** ContinuousStateAttributes  
**Type:** character vector; string  
**Values:** ' ' | user-defined character vector, user-defined string  
**Default:** ' '

**Extended Capabilities**

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.

Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain
dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

Introduced in R2007a
Variant Sink

Route amongst multiple outputs using Variants

Library: Simulink / Signal Routing

Description

The Variant Sink block has one input port and one or more output ports. You can define Variant choices as blocks that are connected to the output port so that, at most, one choice is active.

Each output port is associated with a Variant control. The Variant control that evaluates to `true`, determines which output port is active.

During simulation, Simulink connects the active choice directly to the input port of the Variant Sink block and ignores the inactive choices.

Ports

Input

Port_1 — Input signal

scalar | vector | matrix

Input signal, specified as a scalar, vector, or matrix, to be connected to the active output port.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus` | `struct`
Output

**Port_1 — Output from first Variant**
scalar | vector | matrix

Output signal from the first Variant. The Variant control that evaluates to *true*, determines which output port is active.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Port_N — Output from Nth Variant**
scalar | vector | matrix

Output signal from the Nth Variant. The Variant control that evaluates to *true*, determines which output port is active.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

**Variant control mode — Name of the Variant control mode**
Expression (default) | Label

To choose the active Variant based on the evaluation of the Variant conditions, use the Expression mode else select Label mode. When you select the **Variant control mode** as Label, the **Label mode active choice** option is available. In Label mode, Variant control need not be created in the global workspace. In Label mode, the Variant control is a string that is not evaluated and the choice used in simulation is determined by the **Label mode active choice** parameter. You can select an active Variant choice from **Label mode active choice** options.

When you select Label option, the Variant badge indicates the change.

**Note** When you promote **Label mode active choice** parameter to a mask, the **Variant control mode** is disabled.

- If the block is in Expression mode while promoting **Label mode active choice** parameter to mask, you can change the **Variant control mode** to Label by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in Label mode while promoting Label mode active choice parameter to mask, you cannot change the Variant control mode to Expression mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

**Port — Number of connected input port**

No default

Number of the input port that is connected to one Variant choice upstream of the Variant Sink block. This value is read-only.

Click \[+\] to add a port or \[-\] to delete an existing one.

**Variant control expression — Variant controls available in the global workspace**

'Variant' (default) | boolean condition expression | Simulink.Variant object | Simulink.Parameter object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a Simulink.Variant object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as MATLAB variables.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To enter a Variant name, double-click a **Variant control expression** cell in a new row and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

**Programmatic Use**

**Block Parameter:** VariantControls

**Type:** cell array of character vectors

**Values:** Variant control that is associated with the Variant choice

**Default:** 'Variant'

**Condition (read-only) — Condition for Variant controls**

No default
Displays the **Condition** for the Variant controls that are Simulink.Variant objects. Create or change a Variant condition in the Simulink.Variant parameter dialog box or in the global workspace.

For more information, see “Create Variant Controls Programmatically” and Simulink.Variant.

**Label mode active choice — Name of Variant to use if Label control mode is selected**

Choice_1 (default) | name of variant control

When you select the **Variant control mode** as Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Sink block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see Simulink.Variant.

**Note** **Label mode active choice** option is not available in Expression mode.

**Dependencies**

To enable this parameter, select Label mode.

**Programmatic Use**
**Block Parameter:** LabelModeActivechoice  
**Type:** character vector  
**Values:** Specified by the Variant control expression  
**Default:** Choice_1

**Allow zero active variant controls — Simulate model without active Variant choice**

off (default) | on

To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Sink block. The removed blocks are ignored from update diagram or simulation.
If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

**Dependencies**

Expression option from **Variant control mode** is selected.

**Programmatic Use**

**Block Parameter:** AllowZeroVariantControls  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Show variant condition on block — Annotate block ports**

off (default) | on

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Sink block ports.

**Programmatic Use**

**Block Parameter:** ShowConditionOnBlock  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Analyze all choices during update diagram and generate preprocessor conditionals — Analyze all Variant choices during update diagram or simulation**

off (default) | on

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all Variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal `VariantMerge` block.

When you select this option, the preprocessor conditionals (#if) are generated in the code with ERT-based targets.

When you select this option, the Variant badge indicates the change.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder)
Dependencies

• Expression option from Variant control mode is selected.
• The check box is available for generating ERT targets only.

Programmatic Use

Block Parameter: GeneratePreprocessorConditionals
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Variant Source

Route among multiple inputs using Variants

Library: Simulink / Signal Routing

Description

The Variant Source block has one or more input ports and one output port. You can define Variant choices as blocks that are connected to the input port so that, at most, one choice is active.

Each input port is associated with a Variant control. The Variant control that evaluates to true, determines which input port is active.

When the Analyze all choices during update diagram and generate preprocessor conditionals option in the block dialog box is cleared, then during simulation Simulink connects the active choice directly to the output port of the Variant Source block and ignores the inactive choices.

Ports

Input

Port_1 — Input port associated with first Variant control

scalar | vector | matrix

Input port associated with the first Variant control. The Variant control that evaluates to true, determines which input port is active.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Port_N — Input port associated with Nth Variant control
scalar | vector | matrix

Input port associated with the Nth Variant control. The Variant control that evaluates to true, determines which input port is active.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Output

Port_1 — Output of active Variant
scalar | vector | matrix

Output signal from the active Variant.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Parameters

Variant control mode — Name of the Variant control mode
Expression (default) | Label

To choose the active Variant based on the evaluation of the Variant conditions, use the Expression mode else select Label mode. When you select the Variant control mode as Label, the Label mode active choice option is available. In Label mode, Variant control need not be created in the global workspace. You can select an active Variant choice from Label mode active choice options.

When you select Label option, the Variant badge indicates the change.

Note When you promote Label mode active choice parameter to a mask, the Variant control mode is disabled.
• If the block is in Expression mode while promoting Label mode active choice parameter to mask, you can change the Variant control mode to Label by changing the promoted Label mode active choice parameter from the Mask dialog box.

• If the block is in Label mode while promoting Label mode active choice parameter to mask, you cannot change the Variant control mode to Expression mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

**Port — Number of connected input port**

*no default*

Number of the input port that is connected to one Variant choice upstream of the Variant Source block. This value is read-only.

Click ![+](image) to add a port or ![−](image) to delete an existing one.

**Variant control expression — Variant controls available in the global workspace**

'Variant' (default) | boolean condition expression | Simulink.Variant object | Simulink.Parameter object | enum

Displays the Variant controls available in the global workspace. The Variant control can be a Boolean condition expression or a Simulink.Variant object representing a Boolean condition expression. If you want to generate code for your model, you must define the control variables as Simulink.Parameter objects.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

To edit a Variant name, double-click a Variant control expression cell and type in the Variant control expression. Click **Apply** after you edit a Variant control name. If you add or delete a Variant control without applying the changes, the previous edits on the Variant control name are lost.

The Variant control that evaluates to true determines which input port must be active.

**Programmatic Use**

**Block Parameter:** VariantControls  
**Type:** cell array of character vectors  
**Value:** Variant control that is associated with the Variant choice
**Default:** 'Variant'

**Condition (read-only) — Condition for Variant controls**

no default

Displays the **Condition** for the Variant controls that are `Simulink.Variant` objects.
Create or change a Variant condition in the `Simulink.Variant` parameter dialog box or in the global workspace.

For more information, see “Create Variant Controls Programmatically” and `Simulink.Variant`.

**Label mode active choice — Name of Variant to use if Label control mode is selected**

Choice_1 (default) | name of Variant control

When you select the **Variant control mode** as Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Source block and select **Label Mode Active Choice**.

The **Label mode active choice** drop-down list displays all Variant controls that are currently defined in the global workspace or a data dictionary. Use valid MATLAB identifiers to specify Variant controls. For more information, see `Simulink.Variant`.

**Note** **Label mode active choice** option is not available in **Expression mode**.

**Dependencies**

To enable this parameter, select **Label mode**.

**Programmatic Use**

**Block Parameter:** LabelModeActivechoice

**Type:** character vector

**Value:** Specified by the Variant control expression.

**Default:** Choice_1

**Allow zero active variant controls — Simulate model without active Variant choice**

off (default) | on
To simulate a model (containing a Variant block) without an active Variant choice, select the **Allow zero active variant controls** option. When this option is selected and there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Source block. The removed blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.

When you select this option, the Variant badge indicates the change.

**Dependencies**

Expression option from **Variant control mode** is selected.

**Programmatic Use**

**Block Parameter:** AllowZeroVariantControls  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Show variant condition on block — Annotate block ports**  
off (default) | on

When you select this option, Simulink annotates each Variant control (condition expression) on the Variant Source block ports.

**Programmatic Use**

**Block Parameter:** ShowConditionOnBlock  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'off'

**Analyze all choices during update diagram and generate preprocessor conditionals — Analyze all Variant choices during update diagram or simulation**  
off (default) | on

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis helps Simulink to maintain consistency of all Variant branches during simulation and code generation. Simulink routes the output of the active and inactive regions to an internal VariantMerge block.

When this option is selected, the preprocessor conditionals (#if) are generated in the code with ERT-based targets.
If this option is selected during code generation, the data type and the semantics at all input ports of the Variant Source block must be same to avoid failure.

When you select this option, the Variant badge indicates the change.

For more information, see “Represent Variant Source and Sink Blocks in Generated Code” (Embedded Coder)

**Dependencies**

- Expression option from **Variant control mode** is selected.
- The check box is available for generating ERT targets only.

**Programmatic Use**

**Block Parameter:** GeneratePreprocessorConditionals  
**Type:** character vector  
**Value:** 'off' | 'on'  
**Default:** 'off'

Introduced in R2016a
Variant Subsystem, Variant Model

Template subsystem containing Subsystem blocks or Model blocks as Variant choices

Library:
- Simulink / Ports & Subsystems
- HDL Coder / Ports & Subsystems

Description

The Variant Subsystem block can have at most one active choice for simulation. The Variant Subsystem block is a template preconfigured to contain two Subsystem blocks to use as Variant Subsystem choices.

A Variant Subsystem block can contain a mixture of Subsystem and Model blocks as Variant systems. This can also include Inport, Outport, and Connection Port blocks. There are no drawn connections inside the Variant Subsystem blocks.

A Variant Subsystem block with Model blocks as choices, is called Variant Model block.

Each Variant system is associated with a Variant control that is created in the global workspace. The Variant control determines which Variant system is active. The Variant control can be a condition expression, a Simulink.Variant object specifying a condition expression, or a default Variant. The Variant control that evaluates to true determines the active Variant.

When you select the Specify output when source is unconnected option in the Outport block that is in a Variant Subsystem block, you can specify a non-ground value as its output.

Note You must specify the correct data type in the Signal Attributes section of the Outport block dialog box.
Ports

During simulation, Simulink disables the inactive ports in a Variant Subsystem block.

Input

In_1 — Input port corresponding to root-level Inport blocks contained in Variant Subsystem
same data types accepted by Inport blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the inport names on a Variant system are a subset of the inport names used by the Variant Subsystem container block, then Variant system blocks can have different numbers of inports than the Variant Subsystem block has.

Output

Out_1 — Output port corresponding to root-level Outport blocks contained in Variant Subsystem
same data types accepted by Outport blocks

Each Subsystem or Model block contained within a Variant Subsystem represents one Variant system. If the outport names on a Variant system are a subset of the outport names used by the Variant Subsystem block, then Variant system blocks can have different numbers of outports than the Variant Subsystem block has.

Parameters

Variant control mode — Name of the Variant control mode
Expression (default) | Label

To choose the active Variant based on the evaluation of the Variant conditions, use the Expression mode else select Label mode. When you select the Variant control mode as Label, the Label mode active choice option is available. In Label mode, Variant control need not be created in the global workspace. You can select an active Variant choice from Label mode active choice options.

When you select Label mode, the Variant badge indicates the change.
**Note** When you promote the **Label mode active choice** parameter to a mask, the **Variant control mode** is disabled. While promoting **Label mode active choice** parameter to a mask in a nested model, ensure that you promote **Label mode active choice** parameter to the immediate parent Variant Subsystem block mask.

- If the block is in **Expression** mode while promoting **Label mode active choice** parameter to mask, you can change the **Variant control mode** to Label by changing the promoted **Label mode active choice** parameter from the Mask dialog box.
- If the block is in **Label** mode while promoting **Label mode active choice** parameter to mask, you cannot change the **Variant control mode** to **Expression** mode.

For information about promoting parameters to mask, see “Promote Parameter to Mask”.

**Variant choices (table of variant systems) — Table of variant choices, variant controls, and conditions**

<table>
<thead>
<tr>
<th>Empty table (default)</th>
</tr>
</thead>
</table>

The table has a row for each Variant system contained in the Variant Subsystem. If there are no Variant systems, the table is empty.

You can use buttons to the left of the **Variant choices** table to modify the elements in the table.

<td><img src="image" alt="Image" /></td>
</tr>
</tbody>
</table>

**Name (read-only) — Variant system name**

' ' (default) | name of Subsystem or Model block contained in the Variant Subsystem

This read-only field is based on the Variant system name. To add a Subsystem Variant choice, click ![Image](image). To add a Model Variant choice, click ![Image](image).

**Variant control expression — Variant control in global workspace**

Variant (default) | boolean condition expression | a Simulink.Variant object representing a boolean condition expression | a Simulink.Parameter object (required for code generation) | enum

To enter a Variant name, double-click a **Variant control** cell in a new row and type in the **Variant control expression**.

To enter non-numeric Variant control values, use enumerated data. For information about using enumerated data, see “Use Enumerated Data in Simulink Models”

**Programmatic Use**

**Structure field:** Represented by the read-only `variant.Name` field in the Variant parameter structure

**Type:** character vector

**Value:** Variant control that is associated with the Variant choice

**Default:** 'variant'

**Condition (read-only) — Condition for Variant controls**

' ' (default)
This read-only field is based on the condition for the associated Variant control in the global workspace. Create or change a Variant condition in the Simulink.Variant parameter dialog box or in the global workspace.

**Label mode active choice — Name of Active choice if Label mode is selected**

Choice_1 (default) | on

When you select the **Variant control mode** to Label, the **Label mode active choice** option is available. You can select an active Variant choice from **Label mode active choice** options. You can also right-click the badge on the Variant Subsystem block and select **Label Mode Active Choice**.

For **Label mode active choice** option, the Variant control need not be a Boolean condition expression or a Simulink.Variant object. Variant controls that start with a % symbol are ignored.

**Note** **Label mode active choice** option is not available in Expression mode.

**Dependencies**

To enable this parameter, select Label option from **Variant control mode** parameter.

**Programmatic Use**

**Parameter:** LabelModeActivechoice  
**Type:** character vector  
**Value:** if no Label mode active choice is specified, the value is empty. If Label mode active choice is specified, the value is the name of the Label mode active choice.  
**Default:** ''

**Allow zero active variant controls — Simulate model without using active Variant**

off (default) | on

To simulate a model (containing a Variant system) without an active Variant choice, select the **Allow zero active variant controls** option. When you select this option and if there is no active Variant choice, Simulink disables all the blocks connected to the input and output stream of Variant Subsystem block. The disabled blocks are ignored from update diagram or simulation.

If you do not select this option, Simulink generates an error when there is no active Variant choice.
Dependencies

• The (default) option of Variant is not selected
• Expression option from **Variant control mode** is selected.

Programmatic Use
Parameter: **AllowZeroVariantControls**
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Analyze all choices during update diagram and generate preprocessor conditionals — Generate preprocessor conditionals
off (default) | on

When generating code for an ERT target, this parameter determines whether Variant choices are enclosed within C preprocessor conditional statements (**#if**).

When you select this option, Simulink analyzes all Variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all Variant choices.

When you select this option, the Variant badge changes.

Dependencies

• The check box is available for generating only ERT targets.
• Expression option from **Variant control mode** is selected.

Programmatic Use
Parameter: **GeneratePreprocessorConditionals**
Type: character vector
Value: 'off' | 'on'
Default: 'off'

Propagate conditions outside of variant subsystem — Propagate Variant conditions outside of Variant Subsystem block
off (default) | on
When you select this option, Simulink propagates the Variant conditions outside of the Variant Subsystem block to determine which components of the model are active during simulation.

When you select this option, the Variant badge indicates the change.

Programmatic Use
Parameter: PropagateVariantConditions
Type: character vector
Value: 'off' | 'on'
Default: 'off'

**Introduced in R2010b**
Vector Concatenate, Matrix Concatenate

Concatenate input signals of same data type to create contiguous output signal

**Library:**
- Simulink / Commonly Used Blocks
- Simulink / Math Operations
- Simulink / Signal Routing
- HDL Coder / Math Operations
- HDL Coder / Signal Routing

**Description**

The Concatenate block concatenates the input signals to create an output signal whose elements reside in contiguous locations in memory.

**Tip** The Concatenate block is useful for creating an output signal that is nonvirtual. However, to create a vector of function calls, use a Mux block instead.

You use a Concatenate block to define an array of buses. For details about defining an array of buses, see “Combine Buses into an Array of Buses”.

The Concatenate block operates in either vector or multidimensional array concatenation mode, depending on the setting of its **Mode** parameter. In either case, the block concatenates the inputs from the top to bottom, or left to right, input ports.

**Vector Mode**

In vector mode, all input signals must be either vectors or row vectors (1-by-M matrices) or column vectors (M-by-1 matrices) or a combination of vectors and either row or column vectors. When all inputs are vectors, the output is a vector.

If any of the inputs are row or column vectors, the output is a row or column vector, respectively.
**Multidimensional Array Mode**

Multidimensional array mode accepts vectors and arrays of any size. It assumes that the trailing dimensions are all ones for input signals with lower dimensionality. For example, if the output is 4-D and the input is \([2\times3]\) (2-D), this block treats the input as \([2\times3\times1\times1]\). The output is always an array. The **Concatenate dimension** parameter allows you to specify the output dimension along which the block concatenates its input arrays.

If you set the **Concatenate dimension** parameter to 2 and inputs are 2-D matrices, the block performs horizontal matrix concatenation and places the input matrices side-by-side to create the output matrix. For example, see the ex_concatenate_horizontal model:

If you set the **Concatenate dimension** parameter to 1 and inputs are 2-D matrices, the block performs vertical matrix concatenation and stacks the input matrices on top of each other to create the output matrix. For example, see the ex_concatenate_vertical model:

For horizontal concatenation, the input matrices must have the same column dimension. For vertical concatenation, the input matrices must have the same row dimension. All input signals must have the same dimension for all dimensions other than the concatenation dimensions.
If you set the **Mode** parameter to **Multidimensional array**, the **Concatenate dimension** parameter to 3, and the inputs are 2-D matrices, the block performs multidimensional matrix concatenation. For example, see the `ex_concatenate_multidims` model:

![Block diagram example](image)

**Ports**

**Input**

**Port_1 — First input to concatenate**

scalar | vector | matrix | N-D array

First input to concatenate, specified as a scalar, vector, matrix, or N-D array.

**Dependencies**

- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to **Multidimensional array**.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Port_N — Nth input to concatenate**

scalar | vector | matrix | N-D array

Nth input to concatenate, specified as a scalar, vector, matrix, or N-D array.
**Dependencies**

- To enable this port, set **Number of inputs** to an integer greater than or equal to 2.
- Inputs must be of the same data type.
- Matrix and N-D array inputs are supported only when you set **Mode** to **Multidimensional array**.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**Output**

**Port_1 — Concatenation of input signals**

Scalar | vector | matrix | N-D array

Concatenation of input signals, along specified dimension. Outputs have the same data type as the input.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated

**Parameters**

**Number of inputs — Number of input ports**

2 (default) | positive integer

Specify the number of inputs for the block as a real-valued, positive integer, less than or equal to 65536.

**Programmatic Use**

**Block Parameter:** NumInputs

**Type:** character vector

**Values:** positive integer

**Default:** '2'

**Mode — Type of concatenation**

Vector | Multidimensional array

Select the type of concatenation that this block performs. The default **Mode** of the Vector Concatenate block is Vector. The default **Mode** of the Matrix Concatenate block is Multidimensional array.
• When you select Vector the block performs vector concatenation (see “Vector Mode” on page 1-2297 for details).

• When you select Multidimensional array, the block performs matrix concatenation (see “Multidimensional Array Mode” on page 1-2298 for details).

**Programmatic Use**

**Block Parameter:** Mode

**Type:** character vector

**Values:** 'Vector' | 'Multidimensional array'

**Default:** 'Vector'

**Concatenate dimension — Output dimension along which to concatenate input arrays**

1 (default) | scalar integer

Specify the output dimension along which to concatenate the input arrays.

• To concatenate input arrays vertically, enter 1.
• To concatenate input arrays horizontally, enter 2.
• To perform multidimensional concatenation on the inputs, specify an integer greater than 2.

**Dependencies**

To enable this parameter, set Mode to Multidimensional array.

**Programmatic Use**

**Block Parameter:** ConcatenateDimension

**Type:** character vector

**Values:** scalar integer

**Default:** '1'

Introduced in R2009b
Weighted Sample Time

Support calculations involving sample time
Library: Simulink / Signal Attributes

Description

The Weighted Sample Time block outputs the weighted sample time or weighted sample rate. Because the Weighted Sample Time block is an implementation of the Weighted Sample Time Math, you can also add, subtract, multiply, or divide the input signal, u, by a weighted sample time, Ts. If the input signal is continuous, Ts is the sample time of the Simulink model. Otherwise, Ts is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the Operation parameter. The block can output just a weighted sample time (Ts Only) or a weighted sample rate (1/Ts Only).

Enter the weighting factor in the Weight value parameter. If the weight, w, is 1, that value does not appear in the equation on the block icon.

Tip You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the Operation parameter to Ts and the Weight value to 1.0. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators. See “Operator Precedence” (MATLAB) for information. For example, if the Operation parameter specifies +, the block calculates output using this equation:

\[ u + (Ts \times w) \]

However, if the Operation parameter specifies /, the block calculates output using this equation:
\[
\frac{(u / Ts)}{w}
\]

**Ports**

**Input**

**Port_1 — Input signal**
scalar | vector | matrix

Specify the input signal, \( u \), as a scalar, vector, or matrix. Depending on the value of the **Operation** parameter, the block can add, subtract, multiply, or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**Port_1 — Output signal**
scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, \( Ts \). If the input signal is continuous, \( Ts \) is the sample time of the Simulink model. Otherwise, \( Ts \) is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Parameters**

**Main**

**Operation — Math operation**
Ts Only (default) | + | - | * | / | 1/Ts Only

1-2305
Specify the operation to use for adjusting the input signal. You can select: +, -, *, /, Ts Only, or 1/Ts Only.

**Programmatic Use**  
**Block Parameter:** TsamMathOp  
**Type:** character vector  
**Values:** '+', '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'  
**Default:** 'Ts Only'

**Weight value — Weight of sample time**  
1.0 (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

**Programmatic Use**  
**Block Parameter:** weightValue  
**Type:** character vector  
**Values:** real-valued scalar  
**Default:** '1.0'

**Implement using — Method for adjusting sample time**  
**Online Calculations** (default) | **Offline Scaling Adjustment**

Select one of two modes: online calculations or offline scaling adjustment.

<table>
<thead>
<tr>
<th>Result of (Ts * w)</th>
<th>Output Data Type of Two Modes</th>
<th>Block Execution</th>
</tr>
</thead>
<tbody>
<tr>
<td>A power of 2, or an integer value</td>
<td>The same, when <strong>Output data type</strong> is Inherit: Inherit via internal rule</td>
<td>Equally efficient in both modes</td>
</tr>
<tr>
<td>Not power of 2 and not an integer value</td>
<td>Different</td>
<td>More efficient for the offline scaling mode</td>
</tr>
</tbody>
</table>

**Note** When the **Implement using** parameter is not visible, operations default to online calculations.

**Dependencies**

To enable this parameter, set **Operation** to * or /.
Programmatic Use
Block Parameter: TsampMathImp
Type: character vector
Values: 'Online Calculations' | 'Offline Scaling Adjustment'
Default: 'Online Calculations'

Signal Attributes

Output data type — Data type of output signal
Inherit: Inherit via internal rule (default)| Inherit: Inherit via back propagation | <data type expression>

Specify the data type for the output.

Programmatic Use
Block Parameter: OutDataTypeStr
Type: character vector
Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | '<data type expression>'
Default: 'Inherit: Inherit via internal rule'

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set Operation to +, -, *, or /. If you set the Operation parameter to * or /, you must also set Implement using to Online Calculations.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'
**Saturate on integer overflow — Method of overflow action**

*off (default) | on*

Specify whether overflows saturate or wrap.

<table>
<thead>
<tr>
<th>Action</th>
<th>Rationale</th>
<th>Impact on Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box (on).</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Do not select this check box (off).</td>
<td>You want to optimize efficiency of your generated code.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when
overflow is not possible. In this case, the code generator does not produce saturation code.

Dependencies

To enable this parameter, set **Operation** to +, -, *, or / . If you set the **Operation** parameter to * or / , you must also set **Implement using** to Online Calculations.

**Programmatic Use**

**Block Parameter:** SaturateOnIntegerOverflow

**Type:** character vector

**Values:** 'off' | 'on'

**Default:** 'off'

**Block Characteristics**

<table>

Introduced before R2006a
Waveform Generator

Output waveforms using signal notations
Library: Simulink / Sources

Description

The Waveform Generator block outputs waveforms based on signal notations that you enter in the Waveform Definition table.

This block supports these syntaxes for the signal notations:

- Function syntax — Specify all arguments in the specific order for the signal syntax (see “Algorithms” on page 1-2320).
- Name-value syntax — Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (‘ ’). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN. For more information, see “Algorithms” on page 1-2320.

This block supports normal, accelerator, and rapid accelerator modes and fast restart.

Supported Operators

<table>
<thead>
<tr>
<th>Operation</th>
<th>Operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absolute value</td>
<td>abs()</td>
</tr>
<tr>
<td>Addition</td>
<td>+</td>
</tr>
<tr>
<td>Division</td>
<td>/</td>
</tr>
<tr>
<td>Multiplication</td>
<td>*</td>
</tr>
<tr>
<td>Parentheses</td>
<td>()</td>
</tr>
<tr>
<td>Subtraction</td>
<td>-</td>
</tr>
<tr>
<td>Unary minus</td>
<td>-</td>
</tr>
</tbody>
</table>
The Waveform block observes the following rules of operator precedence:

1  (  )
2  + -  (unary)
3  * /
4  + -

**Supported Operations**

The Waveform Generator block outputs one signal at a time. You can change this output signal. Express frequency and phase offset parameters in radians. You can also:

- Nest signal notations, for example:

  \[
  \text{sin('Amplitude',sin('Amplitude',1,'Frequency',1,'Phase',0),'Frequency',1,'Phase',1)}
  \]
Reference real scalar variables in the base or model workspace, for example:

\[
\text{sin('Amplitude',x,'Frequency',y,'Phase',z)}
\]

\(x, y,\) and \(z\) exist in the base workspace.

For more information on waveforms, see the Algorithms section.

To quickly determine the response of a system to different types of inputs, you can vary the output signal of the Waveform Generator block while a simulation is in progress.

**Limitations**

- You cannot tune the parameters of a waveform, such as frequency or amplitude, during execution of the code that you generate by using Simulink Coder. Instead, you
can generate code that enables you to switch between waveform variants that you specify. For more information, see “Switch Between Output Waveforms During Code Execution for Waveform Generator Block” (Simulink Coder).

**Ports**

**Output**

*Port_1 — Generated output signal*

scalar | vector

Output signal specified by an entry in the **Waveform Definition** table.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | bus

**Parameters**

**Main**

*Output Signal — Waveform for output signal*

1 (default) | integer

Select waveform definition to specify the output signal. The number corresponds to the line item in the **Waveform Definition** table. You can change this parameter while a simulation is running.

**Programmatic Use**

**Block Parameter:** SelectedSignal

**Type:** character vector

**Values:** scalar

**Default:** '1'

*Waveform Definition — Waveform signal notations*

custom | gaussian(mean, variance, seed) | pulse(amplitude, trigger_time, duration) | sawtooth(amplitude, frequence, phase_offset) | sin(amplitude, frequence, phase_offset) |
Enter signal notations in the **Waveform Definition** table, one waveform definition per line. For syntax details, see Algorithms.

### Signal Attributes

Click the **Show data type assistant** button to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

**Output minimum — Minimum output value for range checking**

[] (default) | scalar

Lower value of the output range that Simulink checks.

Simulink uses the minimum to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** **Output minimum** does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter**: OutMin  
**Type**: character vector  
**Values**: '[]'| scalar  
**Default**: '[]'
Output maximum — Maximum output value for range checking

[ ] (default) | scalar

Upper value of the output range that Simulink checks.

Simulink uses the maximum value to perform:

- Parameter range checking (see “Specify Minimum and Maximum Values for Block Parameters”) for some blocks.
- Simulation range checking (see “Signal Ranges” and “Enable Simulation Range Checking”).
- Automatic scaling of fixed-point data types.
- Optimization of the code that you generate from the model. This optimization can remove algorithmic code and affect the results of some simulation modes such as SIL or external mode. For more information, see “Optimize using the specified minimum and maximum values” (Simulink Coder).

**Note** Output maximum does not saturate or clip the actual output signal. Use the Saturation block instead.

**Programmatic Use**

**Block Parameter:** OutMax

**Type:** character vector

**Values:** ['[ ]'] | scalar

**Default:** ['[ ]']

Output data type — Specify the output data type

double (default) | Inherit: Inherit via back propagation | single | int8 | int16 | int32 | uint8 | uint16 | uint32 | int64 | uint64 | fixdt(1,16,2^0,0) | <data type expression> | ...

Choose the data type for the output. The type can be inherited, specified directly, or expressed as a data type object such as Simulink.NumericType.

**Programmatic Use**

**Block Parameter:** OutDataTypeStr

**Type:** character vector

**Values:** Inherit: Inherit via back propagation, single, int8, int16, uint8, uint16, int32, uint32, int64, uint64,
fixdt(1,16,0), fixdt(1,16,2^0,0), fixdt(1,16,2^0,0). '<data type expression>'
Default: 'Double'

Lock output data type setting against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types
off (default) | on

Select to lock the output data type setting of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Use Lock Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Type: character vector
Values: 'off' | 'on'
Default: 'off'

Lock data type settings against changes by the fixed-point tools — Prevent fixed-point tools from overriding data types
off (default) | on

Select to lock data type settings of this block against changes by the Fixed-Point Tool and the Fixed-Point Advisor. For more information, see “Lock the Output Data Type Setting” (Fixed-Point Designer).

Programmatic Use
Block Parameter: LockScale
Values: 'off' | 'on'
Default: 'off'

Integer rounding mode — Specify the rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Choose one of these rounding modes.

Ceiling
Rounds both positive and negative numbers toward positive infinity. Equivalent to the MATLAB ceil function.

Convergent
Rounds number to the nearest representable value. If a tie occurs, rounds to the nearest even integer. Equivalent to the Fixed-Point Designer convergent function.
Floor
 ROUNDS both positive and negative numbers toward negative infinity. Equivalent to the MATLAB floor function.

Nearest
 ROUNDS number to the nearest representable value. If a tie occurs, rounds toward positive infinity. Equivalent to the Fixed-Point Designer nearest function.

Round
 ROUNDS number to the nearest representable value. If a tie occurs, rounds positive numbers toward positive infinity and rounds negative numbers toward negative infinity. Equivalent to the Fixed-Point Designer round function.

Simplest
 AUTOMATICALLY chooses between round toward floor and round toward zero to generate rounding code that is as efficient as possible.

Zero
 ROUNDS number toward zero. Equivalent to the MATLAB fix function.

Programmatic Use
Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'

See Also

For more information, see “Rounding” (Fixed-Point Designer).

Saturate on integer overflow — Method of overflow action
off (default) | on

Specify whether overflows saturate or wrap.
<table>
<thead>
<tr>
<th>Action</th>
<th>Rationale</th>
<th>Impact on Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box (on).</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Do not select this check box (off).</td>
<td>You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when overflow is not possible. In this case, the code generator does not produce saturation code.
Programmatic Use

Block Parameter: `SaturateOnIntegerOverflow`
- **Type**: character vector
- **Values**: 'off' | 'on'
- **Default**: 'off'

Sample time — Time interval between samples

Specify the time interval between samples. To inherit the sample time, set this parameter to `-1`. See “Specify Sample Time” for more information.

Programmatic Use

Block Parameter: `SampleTime`
- **Type**: character vector
- **Values**: scalar
- **Default**: '0.1'

Algorithms

Enter signal notations in the **Waveform Definition** table, one waveform definition per line. To add a waveform definition, click **Add**. The new waveform appears as an empty character vector. The block interprets empty character vectors or white space character vectors as ground.
To remove a waveform definition, click **Remove**. You can select multiple waveforms using **Ctrl+click** or **Shift+click**.

**Constant**

Constant values can be:

- Numbers
- Workspace variables
  - Scalar, real variables only
  - Built-in MATLAB constant, \( \pi \)

**Examples**

- 1
- 1.1
- \( x \)
- \( \pi \)

**Gaussian Noise**

**Syntax**

\[
\text{gaussian}(\text{mean}, \text{variance}, \text{seed})
\]

\[
\text{gaussian}('\text{Mean}', \text{mean}, '\text{Variance}', \text{variance}, '\text{Seed}', \text{seed})
\]

**Input Arguments**

- **mean** — Mean value of the random variable output.
  - Default: 0
- **variance** — Standard deviation squared of the random variable output.
  - Default: 1
- **Value**: Positive constant or positive real scalar variable
- **seed** — Initial seed value for the random number generator.
• Default: 0
• Value: Constant or real scalar variable

Example

`gaussian('Mean',0,'Variance',10,'Seed',1)`

---

**Pulse**

**Syntax**

`pulse(amplitude,trigger_time,duration)`

`pulse('Amplitude',amplitude,'TriggerTime',trigger_time,'Duration',duration)`

**Input Arguments**

• `amplitude` — Value of signal when pulse is high.
  • Default: 1
• `trigger_time` — Elapsed simulation time when signal changes to amplitude, in seconds.
• Default: 1
• Value: Constant or real scalar variable
• duration — How long the signal remains at the given amplitude before returning to ground, in seconds.
  • Default: 1
  • Value: Positive constant or positive real scalar variable

Example

```matlab
pulse('Amplitude',1,'TriggerTime',1,'Duration',1)
```

![Graph showing a pulse wave form]

### Sawtooth

**Syntax**

```matlab
sawtooth(amplitude,frequency,phase_offset)
sawtooth('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_offset)
```
### Input Arguments

- **amplitude** — Sawtooth peak value.
  - Default: 1
- **frequency** — Waveform frequency, in rad/s.
  - Default: 1
- **phase_offset** — Horizontal signal shift, based on elapsed simulation time, in seconds.
  - Default: 0

### Example

```
sawtooth('Amplitude',1,'Frequency',1,'Phase',0)
```
Sine Wave

Syntax

\[
sin(\text{amplitude}, \text{frequency}, \text{phase}\_\text{offset})
\]

\[
sin(\text{'Amplitude'}, \text{amplitude}, \text{'Frequency'}, \text{frequency}, \text{'Phase'}, \text{phase}\_\text{offset})
\]

Input Arguments

- `amplitude` — Amplitude of sine wave.
  - Default: 1
- `frequency` — Waveform frequency, in rad/s.
  - Default: 1
- `phase_offset` — Phase offset, in rads.
  - Default: 0

Examples

\[
sin(\text{'Amplitude'},1,\text{'Frequency'},1,\text{'Phase'},0)
\]

To get the cosine waveform:
sin('Amplitude',1,'Frequency',1,'Phase',pi/2)

Square

Syntax

square(amplitude,frequency,phase_delay,duty_cycle)
square('Amplitude',amplitude,'Frequency',frequency,'Phase',phase_delay,...
'DutyCycle',duty_cycle)

Input Arguments

• amplitude — Amplitude of signal.
  • Default: 1
• frequency — Waveform frequency in rad/s.
  • Default: 1
• phase_delay — Horizontal signal shift based on elapsed simulation time, in seconds.
  • Default: 0
• duty_cycle — Percentage of high signal per period (0-100%). The block clips the minimum signal to 0% and the maximum signal to 100%.
• Default: 50

**Example**

```matlab
square('Amplitude',1,'Frequency',1,'Phase',0,'DutyCycle',50)
```

---

**Step**

**Syntax**

```matlab
step(step_time,initial_value,final_value)
step('StepTime',step_time,'InitialValue',initial_value,'FinalValue',final_value)
```

**Input Arguments**

- **step_time** — Elapsed simulation time when signal changes from **initial value** to **final value**, in seconds.
  
  - Default: 1
  
  - Value: Constant or positive real scalar variable.

- **initial_value** — Value of signal when elapsed simulation time is less than **step_time**, in seconds.
• Default: 0
• `final_value` — Value of signal when elapsed simulation time is greater than or equal to step time, in seconds.
  • Default: 1

**Example**

```matlab
step('StepTime',1,'InitialValue',0,'FinalValue',1)
```

“Signal Basics”

Introduced in R2015b
Weighted Sample Time Math

Support calculations involving sample time

Library: Simulink / Math Operations

Description

The Weighted Sample Time Math block adds, subtracts, multiplies, or divides its input signal, \( u \), by a weighted sample time, \( Ts \). If the input signal is continuous, \( Ts \) is the sample time of the Simulink model. Otherwise, \( Ts \) is the sample time of the discrete input signal. If the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

You specify the math operation with the **Operation** parameter. The block can output just a weighted sample time (**Ts Only**) or a weighted sample rate (**1/Ts Only**).

Enter the weighting factor in the **Weight value** parameter. If the weight, \( w \), is 1, that value does not appear in the equation on the block icon.

**Tip** You can use the Weighted Sample Time and Weighted Sample Time Math blocks to extract the sample time from a Simulink signal. To do so, set the **Operation** parameter to **Ts** and the **Weight value** to **1.0**. In this configuration, the block outputs the sample time of the input signal.

The block computes its output using the precedence rules for MATLAB operators. See “Operator Precedence” (MATLAB) for information. For example, if the **Operation** parameter specifies +, the block calculates output using this equation:

\[ u + (Ts \times w) \]

However, if the **Operation** parameter specifies /, the block calculates output using this equation:

\[ (u / Ts) / w \]
Ports

Input

Port_1 — Input signal
scalar | vector | matrix

Specify the input signal, \( u \), as a scalar, vector, or matrix. Depending on the value of the Operation parameter, the block can add, subtract, multiply, or divide the input signal by weighted sample time or just output the weighted sample time or weighted sample rate.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

Port_1 — Output signal
scalar | vector | matrix

Output the weighted sample time or sample rate of the input signal, or output the input signal adjusted by the weighted sample time, \( Ts \). If the input signal is continuous, \( Ts \) is the sample time of the Simulink model. Otherwise, \( Ts \) is the sample time of the discrete input signal. When the input signal is constant, Simulink assigns a finite sample time to the block based on its connectivity and context.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Parameters

Main

Operation — Math operation
+ (default) | - | * | / | Ts Only | 1/Ts Only

Specify the operation to use for adjusting the input signal. You can select: +, -, *, /, Ts Only, or 1/Ts Only.
Programmatic Use
Block Parameter: TsamMathOp
Type: character vector
Values: '"+' | '-' | '*' | '/' | 'Ts Only' | '1/Ts Only'
Default: '"+'

Weight value — Weight of sample time
1.0 (default) | real-valued scalar

Enter the weight of the sample time as a real-valued scalar.

Programmatic Use
Block Parameter: weightValue
Type: character vector
Values: real-valued scalar
Default: '"1.0'"'

Implement using — Method for adjusting sample time
Online Calculations (default) | Offline Scaling Adjustment

Select one of two modes: online calculations or offline scaling adjustment.

<table>
<thead>
<tr>
<th>Result of (Ts * w)</th>
<th>Output Data Type of Two Modes</th>
<th>Block Execution</th>
</tr>
</thead>
<tbody>
<tr>
<td>A power of 2, or an integer value</td>
<td>The same, when Output data type is Inherit: Inherit via internal rule</td>
<td>Equally efficient in both modes</td>
</tr>
<tr>
<td>Not power of 2 and not an integer value</td>
<td>Different</td>
<td>More efficient for the offline scaling mode</td>
</tr>
</tbody>
</table>

**Note** When the Implement using parameter is not visible, operations default to online calculations.

**Dependencies**
To enable this parameter, set Operation to * or /. 
Programmatic Use

Block Parameter: TsampMathImp
Type: character vector
Values: 'Online Calculations' | 'Offline Scaling Adjustment'
Default: 'Online Calculations'

Signal Attributes

Output data type — Data type of output signal
Inherit: Inherit via internal rule (default) | Inherit: Inherit via back propagation | <data type expression>

Specify the data type for the output.

Programmatic Use

Block Parameter: OutDataTypeStr
Type: character vector
Values: 'Inherit: Inherit via internal rule' | 'Inherit: Inherit via back propagation' | '<data type expression>'
Default: 'Inherit: Inherit via internal rule'

Integer rounding mode — Rounding mode for fixed-point operations
Floor (default) | Ceiling | Convergent | Nearest | Round | Simplest | Zero

Specify the rounding mode for fixed-point operations. For more information, see “Rounding” (Fixed-Point Designer).

Block parameters always round to the nearest representable value. To control the rounding of a block parameter, enter an expression using a MATLAB rounding function into the mask field.

Dependencies

To enable this parameter, set Operation to +, -, *, or /. If you set the Operation parameter to * or /, you must also set Implement using to Online Calculations.

Programmatic Use

Block Parameter: RndMeth
Type: character vector
Values: 'Ceiling' | 'Convergent' | 'Floor' | 'Nearest' | 'Round' | 'Simplest' | 'Zero'
Default: 'Floor'
**Saturate on integer overflow — Method of overflow action**

*off (default) | on*

Specify whether overflows saturate or wrap.

<table>
<thead>
<tr>
<th>Action</th>
<th>Rationale</th>
<th>Impact on Overflows</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box (on).</td>
<td>Your model has possible overflow, and you want explicit saturation protection in the generated code.</td>
<td>Overflows saturate to either the minimum or maximum value that the data type can represent.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box selected, the block output saturates at 127. Similarly, the block output saturates at a minimum output value of -128.</td>
</tr>
<tr>
<td>Do not select this check box (off).</td>
<td>You want to optimize efficiency of your generated code. You want to avoid overspecifying how a block handles out-of-range signals. For more information, see “Check for Signal Range Errors”.</td>
<td>Overflows wrap to the appropriate value that is representable by the data type.</td>
<td>The maximum value that the int8 (signed, 8-bit integer) data type can represent is 127. Any block operation result greater than this maximum value causes overflow of the 8-bit integer. With the check box cleared, the software interprets the overflow-causing value as int8, which can produce an unintended result. For example, a block result of 130 (binary 1000 0010) expressed as int8, is -126.</td>
</tr>
</tbody>
</table>

When you select this check box, saturation applies to every internal operation on the block, not just the output, or result. Usually, the code generation process can detect when
overflow is not possible. In this case, the code generator does not produce saturation code.

**Dependencies**

To enable this parameter, set `Operation` to `+`, `-`, `*`, or `/`. If you set the `Operation` parameter to `*` or `/`, you must also set `Implement using` to `Online Calculations`.

**Programmatic Use**

**Block Parameter:** SaturateOnIntegerOverflow  
**Type:** character vector  
**Values:** 'off' | 'on'  
**Default:** 'off'

**Block Characteristics**

<table>
<thead>

Introduced before R2006a
While Iterator

Repeat execution of a subsystem while a logical expression is true

Library: Ports & Subsystems

Description

The While Iterator block, when placed in a Subsystem block, repeatedly executes the contents of the subsystem during the current time step while the value of the input condition is true or 1. Use this block to implement the block diagram equivalent of a while loop in a programming language.

The While Iterator Subsystem block is preconfigured with a While Iterator block. Placing a While Iterator block in a Subsystem block makes it an atomic subsystem.

Ports

Input

cond — Logical condition signal

scalar

Signal with the result from evaluating a logical condition. Because the subsystem is not externally triggered during a time step, evaluating a condition as true (1) or false (0) must reside within the subsystem.

The data type and values of the signal can be:

• Logical (Boolean) — true (1) or false (0).
• Numerical — true (any positive or negative number) or false (0).
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**IC — Initial logical condition**

scalar

Signal with the initial logical condition. At the beginning of each time step:

- If IC is false (0), the subsystem does not execute during the time step.
- If IC is true (value not equal to 0), the subsystem starts executing and continues to repeat execution as long as the cond signal is true.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output Arguments**

**Iteration number — Signal with the number of iterations**

scalar

Signal with the number of While Iterator Subsystem block executions during each time step.

Data Types: double | int8 | int16 | int32

**Parameters**

**Maximum number of iterations — Specify maximum number of iterations**

-1 (default) | integer

Specify maximum number of iterations allowed during a time step.

-1

Any number of iterations as long as the cond signal is true (value not equal to 0). If you specify -1 and the cond signal never becomes false (0), the simulation runs in an infinite loop. In this case, the only way to stop the simulation is to terminate MATLAB.

integer

Maximum number of iterations during a time step.
Programmatic Use

Block Parameter: MaxIters
Type: character vector
Values: '5' | '-1' | '<integer>'
Default: '5'

While loop type — Select type of block
while (default) | do-while

Select type of block.

while

The While Iterator block has two inputs, a cond (logical condition) input and an IC (initial logical condition) input. The source of the IC signal must be external to the While Iterator Subsystem block.

At the beginning of each time step:

- If the IC input is true (value not equal to 0), the blocks in the subsystem repeat execution while the cond input is true. This process continues during a time step as long as the cond input is true and the number of iterations is less than or equal to the Maximum number of iterations.
- If the IC input is false, the While Iterator block does not execute the contents of the subsystem.

do-while

The While Iterator block has one input, the cond (while condition) input.

At each time step, the blocks in the subsystem repeat execution while the cond input is true (value not equal to 0). This process continues as long as the cond input is true and the number of iterations is less than or equal to the Maximum number of iterations.

Programmatic Use

Block Parameter: WhileBlockType
Type: character vector
Values: 'while' | 'do-while'
Default: 'while'

States when starting — Select block states between time steps
held (default) | reset
Select how to handle block states between time steps.

**held**

Hold block states between time steps. Block state values persist across time steps.

**reset**

Reset block states to their initial values at the beginning of each time step and before the first iteration loop.

**Programmatic Use**

**Block Parameter:** ResetStates

- **Type:** character vector
- **Values:** 'held' | 'reset'
- **Default:** 'held'

**Show iteration number port — Control display of output port**

- **clear** | **select**

Control display of output port for signal with number of block executions. The value of the signal from this port starts at 1 and is incremented by 1 for each succeeding iteration.

- **off**
  - Remove output port.

- **on**
  - Display output port for signal with iteration number.

**Dependencies**

Selecting this parameter enables the **Output data type** parameter.

**Programmatic Use**

**Block Parameter:** ShowIterationPort

- **Type:** character vector
- **Values:** 'off' | 'on'
- **Default:** 'off'

**Output data type — Select output data type for current iteration number**

- **int32 (default)** | **uint32** | **int16** | **uint16** | **int8** | **uint8** | **double**
Select output data type for iteration number signal. The value of this signal is the number of iterations during a time step and the total number of iterations at the end of a time step.

**int32**
Signed 32-bit integer.

**uint32**
Unsigned 32-bit integer.

**int16**
Signed 16-bit integer.

**uint16**
Unsigned 16-bit integer.

**int8**
Signed 8-bit integer.

**uint8**
Unsigned 8-bit integer.

**double**
Double-precision floating point.

**Dependencies**

Select the **Show iteration number port** check box to enable this parameter.

**Programmatic Use**

**Block Parameter:** OutputDataType  
**Type:** character vector  
**Value:** 'int32' | 'uint32' | 'int16' | 'uint16' | 'int8' | 'uint8' | 'double'  
**Default:** 'int32'

Subsystem | While Iterator Subsystem

**Topics**
Iterator Subsystem Execution
Introduced before R2006a
**While Iterator Subsystem**

Subsystem that repeats execution during a simulation time step  
**Library:** Simulink / Ports & Subsystems

**Description**

The While Iterator Subsystem block is a Subsystem block preconfigured as a starting point for creating a subsystem that repeats execution during a simulation time step while a logical condition is true.

Use While Iterator Subsystem blocks to model:

- Block diagram equivalent of a program while or do-while loop.
- An iterative algorithm that converges on a more accurate solution after multiple iterations.

When using simplified initialization mode, if you place a block that needs elapsed time (such as a Discrete-Time Integrator block) in a While Iterator Subsystem block, Simulink displays an error.

If the output signal from a While Iterator Subsystem block is a function-call signal, Simulink displays an error when you simulate the model or update the diagram.
**Ports**

**Input**

**In1 — Signal input to a subsystem block**
scalar | vector | matrix

Placing an Inport block in a subsystem block adds an external input port to the block. The port label matches the name of the Inport block.

Use Inport blocks to get signals from the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

**IC (initial logical condition) — Control initial execution of a subsystem block**
scalar

Placing a While Iterator block connected to an Input block in a Subsystem block adds this external input port to the block.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Output**

**Out — Signal output from a subsystem**
scalar | vector | matrix

Placing an Outport block in a subsystem block adds an output port from the block. The port label on the subsystem block is the name of the Outport block.

Use Outport blocks to send signals to the local environment.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point | enumerated | bus

Introduced before R2006a
**Width**

Output width of input vector  
**Library:** Simulink / Signal Attributes

**Description**

The Width block generates as output the width of its input vector.

You can use an array of buses as an input signal to a Width block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”.

**Ports**

**Input**

*Port_1 — Input signal*  
scalar | vector | matrix | N-D array

Input signal specified as a scalar, vector, matrix, or N-D array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `Boolean` | `fixed point` | `enumerated` | `bus`

**Output**

*Port_1 — Width of input signal*  
scalar

Output is the width of the input signal, specified as a scalar.
Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | fixed point

Parameters

Output data type mode — Output data type mode
Choose intrinsic data type (default) | Inherit via back propagation | All ports same datatype

Specify the output data type to be the same as the input, or inherit the data type by back propagation. You can also choose to specify a built-in data type from the drop-down list in the Output data type parameter.

Programmatic Use
Block Parameter: OutputDataTypeScalingMode
Type: character vector
Values: 'Choose intrinsic data type' | 'Inherit via back propagation' | 'All ports same datatype'
Default: 'Choose intrinsic data type'

Output data type — Output data type
double (default) | single | int8 | uint8 | int16 | uint16 | int32 | uint32

This parameter is visible when you select Choose intrinsic data type for Output data type mode. Select a built-in data type from the drop-down list.

Programmatic Use
Block Parameter: DataType
Type: character vector
Values: 'double' | 'single' | 'int8' | 'uint8' | 'int16' | 'uint16' | 'int32' | 'uint32'
Default: 'double'

Wrap To Zero

Set output to zero if input is above threshold

Library:
Simulink / Discontinuities
HDL Coder / Discontinuities

Description

The Wrap To Zero block sets the output to zero when the input is above the **Threshold** value. When the input is less than or equal to the **Threshold**, then the output is equal to the input.

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal, specified as a scalar or vector. Signal values equal to or greater than the value of **Threshold** are set to zero.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Output

Port_1 — Output signal
scalar | vector

Output signal set to the input signal value or zero. The data type of the output is the same data type as the input.
Tip  If the input data type cannot represent zero, parameter overflow occurs. To detect this overflow, go to the Diagnostics > Data Validity pane of the Configuration Parameters dialog box and set Parameters > Detect overflow to warning or error.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

Parameters

To edit the parameters for the Wrap to Zero block, double-click the block icon.

Threshold — Threshold for outputting zero
255 (default) | scalar

Threshold value for setting the output value to zero.

Programmatic Use
Block Parameter: Threshold
Type: character vector
Values: scalar
Default: '255'

*Introduced before R2006a*
XY Graph

Display X-Y plot of signals using MATLAB figure window

Library:
- Simulink / Sinks
- HDL Coder / Sinks

Description

The XY Graph block displays an X-Y plot of its inputs in a MATLAB figure window.

The block has two scalar inputs. The block plots data from the first input (the x direction) against data from the second input (the y direction). (See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.) This block is
useful for examining limit cycles and other two-state data. Data outside the specified range does not appear.

A figure window appears for each XY Graph block in the model at the start of simulation.

**Note** The XY Graph block does not support stepping back in a simulation.

### Ports

**Input**

**Port_1 — X-axis values**

scalar

Plot input as x values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

**Port_2 — Y-axis values**

scalar

Plot input as y values on an X-Y plot. See “Port Location After Rotating or Flipping” for a description of the port order for various block orientations.

Data Types: single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 | Boolean | fixed point

### Parameters

**X-min — Minimum x**

-1 (default) | real number

Specify the minimum x-axis value. Data below the minimum x is ignored.

**Programmatic Use**

**Block Parameter:** xmin
**Type:** character vector  
**Values:** real number  
**Default:** '-1'

**X-max — Maximum x**  
1 (default) | real number  

Specify the maximum x-axis value. Data above the maximum x is ignored.

**Programmatic Use**  
**Block Parameter:** xmax  
**Type:** character vector  
**Values:** real number  
**Default:** '1'

**Y-min — Minimum y**  
-1 (default) | real number  

Specify the minimum y-axis value. Data below the minimum y is ignored.

**Programmatic Use**  
**Block Parameter:** ymin  
**Type:** character vector  
**Values:** real number  
**Default:** '-1'

**Y-max — Maximum y**  
1 (default) | real number  

Specify the maximum y-axis value. Data above the maximum y is ignored.

**Programmatic Use**  
**Block Parameter:** ymax  
**Type:** character vector  
**Values:** real number  
**Default:** '1'

**Sample time — Sample time**  
-1 (default) | positive number  

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. For more information, see “Specify Sample Time”.

1-2356
Programmatic Use
Block Parameter: st
Type: character vector
Values: '-1' (for inherited) | positive number
Default: '-1'

Zero-Order Hold

Implement zero-order hold sample period
Library: Simulink / Discrete
HDL Coder / Discrete

Description

The Zero-Order Hold block holds its input for the sample period you specify. If the input is a vector, the block holds all elements of the vector for the same sample period.

You specify the time between samples with the Sample time parameter. A setting of -1 means the block inherits the Sample time.

**Tip** Do not use the Zero-Order Hold block to create a fast-to-slow transition between blocks operating at different sample rates. Instead, use the Rate Transition block.

Bus Support

The Zero-Order Hold block is a bus-capable block. The input can be a virtual or nonvirtual bus signal. No block-specific restrictions exist. All signals in a nonvirtual bus input to a Zero-Order Hold block must have the same sample time, even if the elements of the associated bus object specify inherited sample times. You can use a Rate Transition block to change the sample time of an individual signal, or of all signals in a bus. See “Specify Bus Signal Sample Times” and “Bus-Capable Blocks” for more information.

You can use an array of buses as an input signal to a Zero-Order Hold block. For details about defining and using an array of buses, see “Combine Buses into an Array of Buses”.

Comparison with Similar Blocks

The Memory, Unit Delay, and Zero-Order Hold blocks provide similar functionality but have different capabilities. Also, the purpose of each block is different.
This table shows recommended usage for each block.

<table>
<thead>
<tr>

Ports

Input

Port_1 — Input signal
scalar | vector

Input signal that the block holds by one sample period.

Data Types:
single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 |
Boolean | fixed point | enumerated | bus

Output

Port_1 — Output signal
scalar | vector

Output signal that is the input held by one sample period.

Data Types:
single | double | int8 | int16 | int32 | uint8 | uint16 | uint32 |
Boolean | fixed point | enumerated | bus

Parameters

Sample time (-1 for inherited) — Discrete interval between sample time hits
-1 (default) | scalar

Specify the time interval between samples. To inherit the sample time, set this parameter to -1. See “Specify Sample Time” in the online documentation for more information.

Do not specify a continuous sample time, either 0 or [0, 0]. This block supports only discrete sample times. When this parameter is -1, the inherited sample time must be discrete and not continuous.

Introduced before R2006a
Zero-Pole

Model system by zero-pole-gain transfer function

Library: Simulink / Continuous

Description

The Zero-Pole block models a system that you define with the zeros, poles, and gain of a Laplace-domain transfer function. This block can model single-input single-output (SISO) and single-input multiple-output (SIMO) systems.

Conditions for Using This Block

The Zero-Pole block assumes the following conditions:

• The transfer function has the form

\[ H(s) = \frac{KZ(s)}{P(s)} = \frac{(s-Z(1))(s-Z(2)) \ldots (s-Z(m))}{(s-P(1))(s-P(2)) \ldots (s-P(n))} , \]

where \( Z \) represents the zeros, \( P \) the poles, and \( K \) the gain of the transfer function.

• The number of poles must be greater than or equal to the number of zeros.

• If the poles and zeros are complex, they must be complex-conjugate pairs.

• For a multiple-output system, all transfer functions must have the same poles. The zeros can differ in value, but the number of zeros for each transfer function must be the same.

Note You cannot use a Zero-Pole block to model a multiple-output system when the transfer functions have a differing number of zeros or a single zero each. Use multiple Zero-Pole blocks to model such systems.
Modeling a Single-Output System

For a single-output system, the input and the output of the block are scalar time-domain signals. To model this system:

1. Enter a vector for the zeros of the transfer function in the **Zeros** field.
2. Enter a vector for the poles of the transfer function in the **Poles** field.
3. Enter a 1-by-1 vector for the gain of the transfer function in the **Gain** field.

Modeling a Multiple-Output System

For a multiple-output system, the block input is a scalar and the output is a vector, where each element is an output of the system. To model this system:

1. Enter a matrix of zeros in the **Zeros** field.
   
   Each *column* of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

2. Enter a vector for the poles common to all transfer functions of the system in the **Poles** field.

3. Enter a vector of gains in the **Gain** field.
   
   Each element is the gain of the corresponding transfer function in **Zeros**.

   Each element of the output vector corresponds to a column in **Zeros**.

Transfer Function Display on the Block

The Zero-Pole block displays the transfer function depending on how you specify the zero, pole, and gain parameters.

- If you specify each parameter as an expression or a vector, the block shows the transfer function with the specified zeros, poles, and gain. If you specify a variable in parentheses, the block evaluates the variable.

For example, if you specify **Zeros** as \([3,2,1]\), **Poles** as \((\text{poles})\), where \(\text{poles}\) is \([7,5,3,1]\), and **Gain** as \(\text{gain}\), the block looks like this.

\[
\frac{\text{gain}(s^3+s^2+s)}{(s^7+s^5+s^3+s)}
\]
• If you specify each parameter as a variable, the block shows the variable name followed by (s) if appropriate.

For example, if you specify Zeros as zeros, Poles as poles, and Gain as gain, the block looks like this.

\[
\frac{\text{gain} \cdot \text{zeros}(s)}{\text{poles}(s)}
\]

### Ports

#### Input

**Port_1 — Input signal**

scalar

Input signal, specified as a scalar with data type double.

Data Types: double

#### Output

**Port_1 — Output signal**

scalar | vector

System modeled by a zero-pole gain transfer function, provided as a scalar or vector signal with data type double.

- When modeling a single-output system, the block outputs a scalar time-domain signal. For more information, see “Modeling a Single-Output System” on page 1-2365.
- When modeling a multiple-output system, the block outputs a vector, where each element is an output of the system. For more information, see “Modeling a Multiple-Output System” on page 1-2365.

Data Types: double
Parameters

**Zeros — Matrix of zeros**

[1] (default) | vector | matrix

Define the matrix of zeros.

- For a single-output system, enter a vector for the zeros of the transfer function.
- For a multiple-output system, enter a matrix. Each column of this matrix contains the zeros of a transfer function that relates the system input to one of the outputs.

**Programmatic Use**

**Block Parameter:** Zeros

**Type:** character vector, string

**Value:** vector | matrix

**Default:** ' [1] '

**Poles — Vector of poles**

[0 -1] (default) | vector

Define the vector of poles.

- For a single-output system, enter a vector for the poles of the transfer function.
- For a multiple-output system, enter a vector for the poles common to all transfer functions of the system.

**Programmatic Use**

**Block Parameter:** Poles

**Type:** character vector, string

**Value:** vector

**Default:** ' [0 -1] '

**Gain — Vector of gains**

[1] (default) | vector

Define the vector of gains.

- For a single-output system, enter a 1-by-1 vector for the gain of the transfer function.
- For a multiple-output system, enter a vector of gains. Each element is the gain of the corresponding transfer function in **Zeros**.
Programmatic Use
Block Parameter: Gain
Type: character vector, string
Value: vector
Default: '[1]' 

Absolute tolerance — Absolute tolerance for computing block states
auto (default) | scalar | vector

Absolute tolerance for computing block states, specified as a positive, real-valued, scalar or vector. To inherit the absolute tolerance from the Configuration Parameters, specify auto or -1.

- If you enter a real scalar, then that value overrides the absolute tolerance in the Configuration Parameters dialog box for computing all block states.
- If you enter a real vector, then the dimension of that vector must match the dimension of the continuous states in the block. These values override the absolute tolerance in the Configuration Parameters dialog box.
- If you enter auto or -1, then Simulink uses the absolute tolerance value in the Configuration Parameters dialog box (see “Solver Pane”) to compute block states.

Programmatic Use
Block Parameter: AbsoluteTolerance
Type: character vector, string
Values: 'auto' | '-1' | any positive real-valued scalar or vector
Default: 'auto'

State Name (e.g., 'position') — Assign unique name to each state
' ' (default) | 'position' | {'a', 'b', 'c'} | a | ...

Assign a unique name to each state. If this field is blank (' '), no name assignment occurs.

- To assign a name to a single state, enter the name between quotes, for example, 'position'.
- To assign names to multiple states, enter a comma-delimited list surrounded by braces, for example, {'a', 'b', 'c'}. Each name must be unique.
- To assign state names with a variable in the MATLAB workspace, enter the variable without quotes. A variable can be a character vector, string, cell array, or structure.
Limitations

- The state names apply only to the selected block.
- The number of states must divide evenly among the number of state names.
- You can specify fewer names than states, but you cannot specify more names than states.

For example, you can specify two names in a system with four states. The first name applies to the first two states and the second name to the last two states.

Programmatic Use

**Block Parameter:** ContinuousStateAttributes

**Type:** character vector, string

**Values:** ' ' | user-defined

**Default:** ' '

Extended Capabilities

**C/C++ Code Generation**

Generate C and C++ code using Simulink® Coder™.
Not recommended for production-quality code. Relates to resource limits and restrictions on speed and memory often found in embedded systems. The code generated can contain dynamic allocation and freeing of memory, recursion, additional memory overhead, and widely-varying execution times. While the code is functionally valid and generally acceptable in resource-rich environments, smaller embedded targets often cannot support such code.

In general, consider using the Simulink Model Discretizer to map continuous blocks into discrete equivalents that support production code generation. To start the Model Discretizer, select Analysis > Control Design > Model Discretizer. One exception is the Second-Order Integrator block because, for this block, the Model Discretizer produces an approximate discretization.

“State”

Introduced before R2006a
Functions — Alphabetical List
**add_block**

Add block to model

**Syntax**

```matlab
h = add_block(source,dest)
h = add_block(source,dest,'MakeNameUnique','on')
h = add_block(___,'CopyOption','nolink')
h = add_block(sourceIn,destIn,'CopyOption','duplicate')
h = (___,Name,Value)
```

**Description**

`h = add_block(source,dest)` adds a copy of the block `source` from a library or model to the specified destination model and block name. This syntax creates the block at the same location as it appears in the model or the library model.

If you are copying between models or from a library, load the destination model first.

`h = add_block(source,dest,'MakeNameUnique','on')` ensures that the destination block name is unique in the model. This syntax adds a number to the destination block name if a block with that name exists, incrementing to ensure a unique name.

`h = add_block(___,'CopyOption','nolink')` copies the block or subsystem `source` from a library without creating a link to the library block.

`h = add_block(sourceIn,destIn,'CopyOption','duplicate')` duplicates an inport block in a subsystem, giving the destination block the same port number as the source block. Duplicate an inport to branch a signal from an input port without creating a port or adding lines. For more information, see “Creating Duplicate Inports” on page 1-1000.

`h = (___,Name,Value)` uses optional `Name,Value` arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes.
You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

With the add_block function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-112 and “Block-Specific Parameters” on page 6-132.

**Examples**

**Add Block to Model from a Library**

Add the block from the Simulink library to the model f14.

Load or open the destination model.

```matlab
open_system('f14');
```

Add the Scope block from the Simulink Sinks library to f14, naming the new block MyScope.

```matlab
add_block('simulink/Sinks/Scope','f14/MyScope');
```

**Add a Block from Another Model**

Add a copy of a block from the model f14 to vdp.

Load or open the destination model.

```matlab
open_system('vdp');
```

Add the Actuator Model block from f14 to vdp.

```matlab
add_block('f14/Actuator Model','vdp/Actuator Model');
```
### Add a Block Using a Unique Name

Add the block from the Simulink library to the model `vdp`. Because there is already a block named Scope in `vdp`, use the `MakeNameUnique` option to ensure that the new block name is unique.

Load or open the destination model.

```matlab
open_system('vdp');
```

Add the Scope block from the Simulink Sinks library to `vdp`, ensuring that the name is unique.

```matlab
add_block('simulink/Sinks/Scope','vdp/Scope','MakeNameUnique','on')
```

### Duplicate an Inport Block in a Subsystem

Add an inport block in the `f14/Controller` subsystem that uses the same port number as another inport in that subsystem.

Duplicate the Stick Input (in) block in the Controller subsystem, naming the copy Stick Input (in)2. The resulting block uses the same port number as Stick Input (in) but does not add an inport on the parent subsystem. The signal that enters that port branches to both inports.

```matlab
add_block('f14/Controller/Stick Input (in)',...
 'f14/Controller/Stick Input (in)2','CopyOption','duplicate')
```

### Add a Block and Set Parameters

Add a block from a library to a model and set parameters using a Name,Value pair.

Load or open the destination model.

```matlab
open_system('vdp');
```

Add a Gain block from the library to `vdp`, and set the Gain value to 5.
add_block('simulink/Math Operations/Gain','vdp/Five','Gain','5')

**Input Arguments**

**source — Block to copy to model**

block path name | library block path name

Block to copy to model, specified as:

- The full block path name if you are copying the block from another model, for example, 'vdp/Mu'. This usage copies the block and its settings.
- The library block path name if you want to add a block from a library, for example, 'simulink/Math Operations/Gain'.

To get the library block path name, you can hover over the block in the Library Browser. Alternatively, you can open the library model, select the block, and enter `gcb` at the command line. To open the library model, in the Library Browser, right-click the library name in the library list and select *Open library_name library*.

You can also use the syntax `built-in/blocktype` as the source block path name, where `blocktype` is the programmatic block name—the value of the BlockType parameter (see “Common Block Properties” on page 6-112). However, blocks added using `built-in/blocktype` sometimes have different default parameter values from library blocks.

For subsystems and masked blocks, use the library block path name. Using the BlockType value (SubSystem) creates an empty subsystem.

Example: 'vdp/Mu','simulink/Sinks/Scope'

**dest — Name and location of new block**

block path name

Name and location of the new block in the model, specified as the block path name.

Example: 'f14/Controller/MyNewBlock'

**sourceIn — Inport block whose port number to copy**

block path name

Inport block whose port number to copy, specified as the block path name.
Example: 'f14/Controller/Stick Input (in)', 'myModel/mySubsystem/In1'

destIn — Inport block to create
block path name

Inport block with duplicate port number to create, specified as the block path name. Create the destination block in the same system as the source block.

Example: 'myModel/mySubsystem/DupPortIn'

Output Arguments

h — New block
handle

New block, returned as a handle.

See Also

delete_block

Topics

“Delete an Annotation Programmatically”
“Create Annotations Programmatically”

Introduced before R2006a
add_exec_event_listener

Register listener for block method execution event

Syntax

\[
h = \text{add_exec_event_listener}(blk, \text{event}, \text{listener});\]

Description

\[
h = \text{add_exec_event_listener}(blk, \text{event}, \text{listener})\]

registers a listener for a block method execution event where the listener is a MATLAB program that performs some task, such as logging runtime data for a block, when the event occurs (see “Listen for Method Execution Events”). Simulink software invokes the registered listener whenever the specified event occurs during simulation of the model. You cannot register a listener for virtual blocks.

**Note** Simulink software can register a listener only while a simulation is running. Invoking this function when no simulation is running results in an error message. To ensure that a listener catches all relevant events triggered by a model’s simulation, you should register the listener in the model's StartFcn callback function (see “Callbacks for Customized Model Behavior”).

Input Arguments

**blk**

Specifies the block whose method execution event the listener is intended to handle. May be one of the following:

- Full pathname of a block
- A block handle
- A block runtime object (see “Access Block Data During Simulation”.)
event
Specifies the type of event for which the listener listens. It may be any of the following:

<table>
<thead>
<tr>
<th>Event</th>
<th>Occurs...</th>
</tr>
</thead>
<tbody>
<tr>
<td>'PreDerivatives'</td>
<td>Before a block's Derivatives method executes</td>
</tr>
<tr>
<td>'PostDerivatives'</td>
<td>After a block's Derivatives method executes</td>
</tr>
<tr>
<td>'PreOutputs'</td>
<td>Before a block's Outputs method executes</td>
</tr>
<tr>
<td>'PostOutputs'</td>
<td>After a block's Outputs method executes</td>
</tr>
<tr>
<td>'PreUpdate'</td>
<td>Before a block's Update method executes</td>
</tr>
<tr>
<td>'PostUpdate'</td>
<td>After a block's Update method executes</td>
</tr>
</tbody>
</table>

listener
Specifies the listener to be registered. It may be either a character vector specifying a MATLAB expression, e.g., 'disp(''here'')' or a handle to a MATLAB function that accepts two arguments. The first argument is the block runtime object of the block that triggered the event. The second argument is an instance of EventData class that specifies the runtime object and the name of the event that just occurred.

Output Arguments

add_exec_event_listener returns a handle to the listener that it registered. To stop listening for an event, use the MATLAB clear command to clear the listener handle from the workspace in which the listener was registered.

Introduced before R2006a
add_line

Add line to Simulink model

Syntax

h = add_line(sys,out,in)
h = add_line(sys,out,in,'autorouting',autoOption)
h = add_line(sys,points)

Description

h = add_line(sys,out,in) adds a line in the model or subsystem sys that connects one block's output port out to another block's input port in. This syntax draws the most direct route from port to port, for example, diagonal lines or lines that go through other blocks.

You can connect ports when:

• The input port does not already have a connection.
• The blocks are compatible for connecting.

h = add_line(sys,out,in,'autorouting',autoOption) connects blocks, specifying whether to route the lines around other blocks.

h = add_line(sys,points) adds a line drawn by (x,y) coordinate points relative to the upper-left corner of the Simulink Editor canvas before any canvas resizing. If either end of the line is within five pixels of a corresponding port, the function connects the line to it. The line can have multiple segments.

Examples

Connect Blocks Using Port Numbers

Use the block port numbers to add a line to connect blocks.
Create a model and open it.

```matlab
open_system(new_system('connect_model'));
```

Add and position a Constant block and a Gain block.

```matlab
add_block('simulink/Commonly Used Blocks/Constant','connect_model/Constant');
set_param('connect_model/Constant','position',[140,80,180,120]);
add_block('simulink/Commonly Used Blocks/Gain','connect_model/Gain');
set_param('connect_model/Gain','position',[220,80,260,120]);
```

Connect the blocks. Each block has one port, so specify port 1.

```matlab
add_line('connect_model','Constant/1','Gain/1');
```

**Connect Blocks Using Port Handles**

Get the port handles and connect the ports using `add_line`.

Open the model `vdp`.

```matlab
open_system('vdp');
```

Delete the line that connects the Mu gain block to the Sum block.

```matlab
delete_line('vdp','Mu/1','Sum/2');
```

Get the port handles from the Mu block and the Sum block.

```matlab
h = get_param('vdp/Mu','PortHandles');
h1 = get_param('vdp/Sum','PortHandles');
```

Look at the `h1` structure. Notice the two handles for the Inport property.

```matlab
h1
```

```matlab
h1 =

struct with fields:

    Inport: [47.0002 54.0002]
    Outport: 39.0002
    Enable: []
    Trigger: []
    State: []
Index into the Outport and Inport properties on the port handles to get the handles you want and connect them. Connect to the second inport.

```matlab
add_line('vdp',h.Outport(1),h1.Inport(2));
```

**Add a Branched Line**

You can branch a line by adding a connection programmatically. You can use the `points` syntax to draw the segment, or you can draw the line by specifying the ports to connect. When using the port, use automatic line routing to improve the look of the branched line.

Add a scope to the `vdp` model above the outport.

```matlab
vdp
add_block('simulink/Commonly Used Blocks/Scope','vdp/Scope1');
set_param('vdp/Scope1','position',[470,70,500,110]);
```

Connect the Integrator block `x1` to `Scope1`. This code branches the existing line from the `x1` output and connects it to the scope. With autorouting on, the resulting line is segmented.

```matlab
add_line('vdp','x1/1','Scope1/1','autorouting','on');
```

**Connect Blocks Using Points**

You can use points on the canvas as the start and end of each segment. Get the port locations using `get_param` with the 'PortConnectivity' option.

Open the model `vdp` and delete the line that connects the Mu and Sum blocks.

```matlab
vdp
delete_line('vdp','Mu/1','Sum/2')
```

Get the port locations for Mu. Mu has two ports. The first is the input port, and the second is the output port.
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
ans =
  190   150

ans =
  225   150

Get the port locations for Sum, which has three ports. The second position is the lower input port.
s = get_param('vdp/Sum','PortConnectivity');
s.Position
ans =
  250   135

ans =
  250   150

ans =
  285   145

Connect the ports using the output and input points.
add_line('vdp',[225 150; 250 150])

**Connect Blocks Using Autorouting Options**

This example shows the effect of adding lines with and without autorouting options.

Create a model route. Display default block names.

open_system(new_system('route'));
set_param('route','HideAutomaticNames','off')
Add blocks as shown. Add an inport and outport to each subsystem.

Add lines to connect the outputs from Subsystem to the inputs of Subsystem1.

```matlab
add_line('route', {'Subsystem/1', 'Subsystem/2'}, ...
            {'Subsystem1/1', 'Subsystem1/2'})
```

Because you did not use the autorouting options, the function draws straight lines, which pass through the Gain block.

Delete the lines. Add lines again, this time using the autorouting option set to 'on'.

```matlab
add_line('route', {'Subsystem/1', 'Subsystem/2'}, ...
            {'Subsystem1/1', 'Subsystem1/2'}, 'autorouting', 'on')
```

The lines route around the Gain block.
Delete the lines. Add lines again, using the `smart` autorouting option. When you use an array to connect two sets of inports and outports, 'smart' autorouting routes them together if doing so makes better use of the space.

```matlab
add_line('route',{Subsystem/1,Subsystem/2},...
    {Subsystem1/1,Subsystem1/2},'autorouting','smart')
```

### Input Arguments

**sys** — Model or subsystem to add line to  
character vector

Model or subsystem to add the line to, specified as character vector.

Example: `'vdp'`, `'f14/Controller'`

**out** — Block output port to connect line from  
block/port name or number character vector | port handle | array of port designators

Block output port to connect line from, specified as:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name `State` instead of a port number.
- The port handle that you want to connect from.
- An array of either of these port designators.

Use `'PortHandles'` with `get_param` to get the handles.

Example: `'Mu/1'`, `'Subsystem/2', h.Outport(1){"Subsystem/1', 'Subsystem/2'}`
**in — Block input port to connect line to**

Block input port to connect line to, specified as:

- The block name, a slash, and the port name or number. The port name on:
  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to add the line to.
- An array of either of these port designators.

Use the 'PortHandles' option with `get_param` to get handles.

Example: `Mu/1`, `Subsystem/2`, `h.Inport(1), {'Subsystem/1','Subsystem/2'}`

**autoOption — Type of automatic line routing**

'off' (default) | 'on' | 'smart'

Type of automatic line routing around other blocks, specified as:

- 'off' for no automatic line routing
- 'on' for automatic line routing
- 'smart' for automatic line routing that takes the best advantage of the blank spaces on the canvas and avoids overlapping other lines and labels

**points — Points of the line to draw**

matrix

Points of the line to draw, specified as at least a 2-by-2 matrix. Add a row for every segment you want to draw. Specify points as (x,y) coordinates from the upper-left corner of the Editor before any canvas resizing.

Example: `[100 300; 200 300; 200 300; 200 500]`
Output Arguments

h — Line handle

Line created by add_line, returned as a handle.

Introduced before R2006a
add_param

Add parameter to Simulink system

Syntax

add_param('sys','parameter1',value1,'parameter2',value2,...)

Description

The add_param command adds the specified parameters to the specified system and initializes the parameters to the specified values. Case is ignored for parameter names. Value character vectors are case sensitive. The value of the parameter must be a character vector. Once the parameter is added to a system, set_param and get_param can be used on the new parameters as if they were standard Simulink parameters. Simulink software saves these new parameters with the model file.

Note If you attempt to add a parameter that has the same name as an existing parameter of the system, Simulink software displays an error.

Examples

This command

add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')

adds the parameters DemoName and EquationOrder with 'VanDerPolEquation' and '2' to the vdp system. Afterward, you can use the following command to retrieve the value of the DemoName parameter.

get_param('vdp','DemoName')

Introduced before R2006a
addFile

(Not recommended) Add file to project

**Note**  *simulinkproject* is not recommended. Use *currentProject* or *openProject* instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
addFile(proj, fileorfolder)
```

**Description**

`addFile(proj, fileorfolder)` adds a file to the project `proj`.

**Examples**

**Add Files to a Project**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Remove a file.

```matlab
removeFile(proj,'models/AnalogControl.slx')
```

Add the file back to the project.

```matlab
addFile(proj,'models/AnalogControl.slx');
```

Create and save a new model.

```matlab
new_system('mymodel');
save_system('mymodel');
```
Add the new file to the project and return a project file object.
newPrjFile = addFile(proj,'mymodel.slx');

Use the project file object to manipulate the file, for example, adding a label.
addLabel(newPrjFile, 'Classification', 'Design')

Input Arguments

proj — Project
description as a project object. Use simulinkproject to create a project object to manipulate a project at the command line.

fileorfolder — Path of file or folder
description as a character vector | cell array of character vectors | string array

Path of the file or folder to add relative to the project root folder, specified as a character vector, string, or array. Files must include the file extension. The file or folder must be within the root folder.

Example: ‘models/myModelName.slx’

Compatibility Considerations

Simulink project API is not recommended
Not recommended starting in R2019a

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions
addFolderIncludingChildFiles | removeFile | simulinkproject

Introduced in R2013a
addFolderIncludingChildFiles

(Not recommended) Add folder and child files to project

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
addFolderIncludingChildFiles(proj, folder)
```

**Description**

`addFolderIncludingChildFiles(proj, folder)` adds a folder and all child files to the project `proj`.

**Examples**

**Add Folders to a Project**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new folder in the project folder.

```matlab
new_folder_path = fullfile(proj.RootFolder, 'new_folder')
mkdir(new_folder_path);
```

Create a new folder in the previous folder.

```matlab
new_sub_folder_path = fullfile(new_folder_path, 'new_sub_folder')
mkdir(new_sub_folder_path);
```
Create a new file in the folder.

```matlab
filepath = fullfile(new_sub_folder_path, 'new_model_in_subfolder.slx')
new_system('new_model_in_subfolder');
save_system('new_model_in_subfolder', filepath)
```

Add this new folder and child files to the project.

```matlab
projectFile = addFolderIncludingChildFiles(proj, new_folder_path)
```

**Input Arguments**

- `proj` — Project
  project object

  Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

- `folder` — Path of folder
  character vector | string

  Path of the folder to add relative to the project root folder, specified as a character vector or string. The folder must be within the root folder.

  Example: ‘models’

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

addFile | removeFile | simulinkproject

Introduced in R2015b
addterms

Add terminators to unconnected ports in model

Syntax

addterms('sys')

Description

addterms('sys') adds Terminator and Ground blocks to the unconnected ports in the Simulink block diagram sys.

See Also

slupdate

Introduced before R2006a
attachComponent

Attach a component to a configuration set

Syntax

attachComponent(cs,component)

Description

attachComponent(cs,component) attaches a component to a Simulink.ConfigSet object.

Examples

Replace Solver Component for Active Configuration Set

Replace the solver component of the active configuration set of one model with the solver component of another model.

Get the active configuration set for modelB.

hCs = getActiveConfigSet('modelB');

Get the 'Solver' component for this configuration set.

hSolverConfig = getComponent(hCs,'Solver');

Create a copy of the component.

hSolverConfig = copy(hSolverConfig);

Get the active configuration set for modelA.

hCs = getActiveConfigSet('modelA');

Attach the copy of the 'Solver' component from modelB to modelA.
attachComponent(hCs,hSolverConfig);

**Input Arguments**

- **cs** — Configuration set object  
  *ConfigSet object*  
  A configuration set object that you can attach a component to.

- **component** — Component object  
  *SimulinkConfigComponent object*  
  A component that you can attach to configuration set.

**See Also**

- *Simulink.ConfigSet*

**Topics**

- “About Configuration Sets”
- “Manage a Configuration Set”

**Introduced before R2006a**
attachConfigSet

Associate configuration set or configuration reference with model

Syntax

attachConfigSet(model, configObj)
attachConfigSet(model, configObj, allowRename)

Arguments

model
The name of an open model, or gcs to specify the current model
configObj
A configuration set (Simulink.ConfigSet) or configuration reference (Simulink.ConfigSetRef)
allowRename
Boolean that determines how Simulink software handles a name conflict

Description

attachConfigSet associates the configuration set or configuration reference (configuration object) specified by configObj with model.

You cannot attach a configuration object to a model if the configuration object is already attached to another model, or has the same name as another configuration object attached to the same model. The optional Boolean argument allowRename determines how Simulink software handles a name conflict between configuration objects. If allowRename is false and the configuration object specified by configObj has the same name as a configuration object already attached to model, Simulink software generates an error. If allowRename is true and a name conflict occurs, Simulink software provides a unique name for configObj before associating configObj with model.
Examples

The following example creates a copy of the current model’s active configuration object and attaches it to the model, changing its name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```matlab
myConfigObj = getActiveConfigSet(gcs);
copiedConfig = myConfigObj.copy;
copiedConfig.Name = 'DevConfig';
attachConfigSet(gcs, copiedConfig, true);
```

See Also

Introduced before R2006a
attachConfigSetCopy

Copy configuration set or configuration reference and associate it with model

Syntax

myConfigObj = attachConfigSetCopy(model, configObj)
myConfigObj = attachConfigSetCopy(model, configObj, allowRename)

Arguments

model
  The name of an open model, or gcs to specify the current model
configObj
  A configuration set (Simulink.ConfigSet) or configuration reference
  (Simulink.ConfigSetRef)
allowRename
  Boolean that specifies how Simulink software handles a name conflict

Description

attachConfigSetCopy copies the configuration set or configuration reference
(configuration object) specified by configObj and associates the copy with model.
Simulink software returns the copied configuration object as newConfigObj.

You cannot attach a configuration object to a model if the configuration object has the
same name as another configuration object attached to the same model. The optional
Boolean argument allowRename determines how Simulink software handles a name
conflict between configuration objects. If allowRename is false and the configuration
object specified by configObj has the same name as a configuration object already
attached to model, Simulink software generates an error. If allowRename is true and a
name conflict occurs, Simulink software provides a unique name for the copy of
configObj before associating it with model.
Examples

The following example creates a copy of ModelA's active configuration object and attaches it to ModelB, changing the name if necessary to be unique. The code is the same whether the object is a configuration set or configuration reference.

```matlab
myConfigObj = getActiveConfigSet('ModelA');
newConfigObj = attachConfigSetCopy('ModelB', myConfigObj, true);
```

Introduced in R2006b
addLabel

(Not recommended) Attach label to project file

**Note**  `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

`addLabel(file, categoryName, labelName)`

`addLabel(file, categoryName, labelName, labelData)`

**Description**

`addLabel(file, categoryName, labelName)` attaches the specified label `labelName` in the category `categoryName` to the file.

`addLabel(file, categoryName, labelName, labelData)` attaches the label with data `labelData`.

**Examples**

**Attach a Label to a Project File**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```matlab
myfile = findFile(proj, 'models/AnalogControl.slx')
```

`myfile =`
ProjectFile with properties:

    Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
    Labels: [1x1 slproject.Label]
    Revision: '2'
    SourceControlStatus: Unmodified

Get the Labels property of the file.

myfile.Labels

ans =

    Label with properties:

        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: []
        DataType: 'none'
        Name: 'Design'
        CategoryName: 'Classification'

Attach the label 'Artifact' to the file.

addLabel(myfile,'Classification','Artifact')

ans =

    Label with properties:

        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: []
        DataType: 'none'
        Name: 'Artifact'
        CategoryName: 'Classification'

Index into the Labels property to get the label attached to this file.

reviewlabel = myfile.Labels(1)

reviewlabel =

    Label with properties:

        File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
        Data: []
        DataType: 'none'
Name: 'Artifact'
CategoryName: 'Classification'

Detach the new label from the file.
removeLabel(myfile, reviewlabel)

### Attach a Label to a Subset of Files

Attach the 'Classification' category label 'Utility' to all files in the project that have the .m file extension.

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of files.

```matlab
files = proj.Files;
```

Loop through each file. If a file has the extension .m, attach the label 'Utility'.

```matlab
for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension, '.m')
        addLabel(file, 'Classification', 'Utility');
    end
end
```

In the Project Files view, the Classification column displays the label Utility for each .m file in the utilities folder.

### Attach a Label and Label Data to a File

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category 'Review'.

2-34
createCategory(proj,'Review','char');

For the new category, create a label 'To Review'.

reviewCategory = findCategory(proj,'Review');
cREATE LABEL(reviewCategory,'To Review');

Get a particular file by name.

myfile = findFile(proj,'models/AnalogControl.slx')

myfile =

ProjectFile with properties:
    Path: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
    Labels: [1x1 slproject.Label]
    Revision: '2'
    SourceControlStatus: Unmodified

Attach the label 'To Review' and a character vector of label data to the file.

addLabel(myfile,'Review','To Review','Whole team design review')

Index into the Labels property to get the second label attached to this particular file, and see the label data.

myfile.Labels(2)

ans =

Label with properties:
    File: 'C:\Work\temp\slexamples\airframe\models\AnalogControl.slx'
    Data: 'Whole team design review'
    DataType: 'char'
    Name: 'To Review'
    CategoryName: 'Review'

In the Project Files view, for the AnalogControl.slx file, the Review column displays the To Review label with label data.

Alternatively, you can set or change label data using the data property.
mylabel = myfile.Labels(2);
mylabel.Data = 'Final review';

**Input Arguments**

**file** — File to attach label to
file object

File to attach the label to, specified as a file object. You can get the file object by examining the project’s Files property (proj.Files), or use findFile to find a file by name. The file must be in the project.

**categoryName** — Name of category for label
character vector

Name of the category for the label, specified as a character vector.

**labelName** — Name of label
character vector | label definition object

Name of the label to attach, specified as a character vector or a label definition object returned by the file.Label property or findLabel. You can specify a new label name that does not already exist in the project.

**labelData** — Data to attach to label
character vector | numeric

Data to attach to the label, specified as a character vector or numeric. Data type depends on the label definition. Get a label to examine its DataType property using file.Label or findLabel.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will

2-36
continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Introduced in R2013a
batchsim

Offload simulations to run on a compute cluster

Syntax

simJob = batchsim(in)
simJob = batchsim(myCluster,in)
simJob = batchsim(...,Name,Value)

Description

simJob = batchsim(in) runs a batch job on a single worker to simulate a model using the inputs specified in the SimulationInput object, in.

simJob = batchsim(myCluster,in) runs a batch job on the cluster identified by the cluster object myCluster. If a cluster profile is not specified, batchsim uses a default cluster profile as set up in the parallel preferences. For more information, see “Discover Clusters and Use Cluster Profiles” (Parallel Computing Toolbox).

simJob = batchsim(...,Name,Value) runs a batch job that simulates a model using the inputs specified in the SimulationInput object and the options specified as Name,Value pair.

batchsim offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later. Use the 'Pool' argument to run simulations in parallel.

The batchsim command uses the Parallel Computing Toolbox™ and MATLAB Parallel Server™ licenses to run the simulations on compute cluster. batchsim runs the simulations in serial if a parallel pool cannot be created. If Parallel Computing Toolbox license is not available, batchsim errors out.

Examples
Run Parallel Simulations with `batchsim`

This example shows how to run parallel simulations in batch. `batchsim` offloads simulations to a compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

This example uses the `ex_sldemo_househeat` model and runs simulations in batch to observe the model behavior for different temperature set points.

Open the model.

```matlab
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Define a set of values for different temperatures.

```matlab
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```matlab
in(1:spv_Length) = Simulink.SimulationInput('ex_sldemo_househeat');
for i = 1:1:spv_Length
    in(i) = in(i).setBlockParameter('ex_sldemo_househeat/Set Point','Value',num2str(setPointValues(i)));
end
```

Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, let's assume that three workers are available to run a batch job for the parallel simulations.

The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` tells you how many workers are running the simulations. `NumWorkers` is always the number of workers specified in the 'Pool' argument and an additional head worker.

```matlab
simJob = batchsim(in,'Pool',3)
```

```
ID: 1
Type: pool
NumWorkers: 4
Username: #####
State: running
```
Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

```matlab
out = fetchOutputs(simJob)
```

**1x11 Simulink.SimulationOutput array**

### Input Arguments

**`in` — Simulink.SimulationInput object used to simulate the model**

Object, array

Specified as a `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for simulation.

Example: `in = Simulink.SimulationInput('vdp')`

**myCluster — `parallel.Cluster` object**

Object

Cluster object that is used to specify the cluster in which the batch job runs.

### Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'Pool', 5`

**AdditionalPaths — Files to attach to parallel pool**

Character vector | cell array

Specified as a character vector, a cell array or an array of character vector to define paths to be added to the MATLAB search path of the workers before the simulations execute. The default search path might not be the same on the workers as it is on the client; the
path difference could be the result of different current working folders (pwd), platforms, or network file system access. The 'AdditionalPaths' property can assure that workers are looking in the correct locations for necessary code files, data files, model files, etc.

**AttachedFiles — Files to attach to parallel pool**
cell array

Specified as a cell array of additional files to attach to the parallel pool.

**AutoAddClientPath — Whether user-added entries on client path are added to each worker path**
true (default) | false

Specified as true or false to control whether user-added entries on the client path are added to each worker path.

**AutoAttachedFiles — Whether code files should be automatically attached to the job**
true (default) | false

Specified as true or false to control whether code files are automatically attached to the job.

**CaptureDiary — Whether diary is collected**
true (default) | false

Specified as true or false to indicate collection of the diary.

**CleanupFcn — Function handle to run once per worker after running simulations**
function handle

Specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.

**EnvironmentVariables — Names of environment variables copied from client session to workers**
character vector | cell array

Specifies the names of environment variables copied from the client session to the workers. The names specified here are appended to the 'EnvironmentVariables' property specified in the applicable parallel profile to form the complete list of environment variables. Any variables listed which are not set are not copied to the
workers. These environment variables will be set on the workers for the duration of the batch job.

**ManageDependencies — Manage model dependencies**

'off' (default) | 'on'

When ManageDependencies is set to 'on', model dependencies are automatically sent to the parallel workers if necessary. If ManageDependencies is set to 'off', explicitly attach model dependencies to the parallel pool.

**Pool — Size of the number of workers for a parallel pool**

An integer specifying the number of workers to make into a parallel pool for the job in addition to the worker running the batch job itself. The simulations use this pool for execution. Because the pool requires N workers in addition to the worker running the batch, there must be at least N+1 workers available on the cluster.

**Profile — Cluster profile name**

The name of a cluster profile used to identify the cluster. If this option is omitted, the default profile is used to identify the cluster and is applied to the job and task properties.

**SetupFcn — Function handle to run once per worker**

Specify a function handle to 'SetupFcn' to run once per worker before the start of the simulations.

**Note** When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set 'LoadExternalInput' to 'off' or ensure that the specified external input is available on the workers to prevent compilation error.

**ShowProgress — Show the progress of the simulations in diary**

'off' | 'on'

Set to 'on', to copy the progress of the simulations in the command window to diary of `Simulink.Simulation.Job` object. The progress is hidden when set to 'off'.

2-42
**StopOnError — Stop simulations on errors**
'off' (default) | 'on'

Setting 'StopOnError' to 'on' stops the execution of simulations if an error is encountered.

**TransferBaseWorkspaceVariables — Transfer variables to the parallel workers**
'off' (default) | 'on'

When TransferBaseWorkspaceVariables is set to true, variables used in the model and defined in the base workspace are transferred to the parallel workers.

**Note** Use of TransferBaseWorkspaceVariables requires model compilation.

**UseFastRestart — Use fast restart**
'off' (default) | 'on'

When UseFastRestart is set to true, simulations run on the workers using fast restart.

**Note** When using batchsim, use the UseFastRestart option and not the FastRestart option. See “Get Started with Fast Restart” for more information.

**Output Arguments**

**simJob — Simulink.Simulation.Job job object**

object

An object containing metadata of submitted batch job. Poll job object using it's ID to check the status of simulations or to access outputs on completion of the job.
Extended Capabilities

Automatic Parallel Support
Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

Using `batchsim` with Parallel Computing Toolbox installed, MATLAB automatically opens a worker and runs the job in the background on another session on your local machine. Specifying a pool size runs the simulations on the number of workers specified. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

Introduced in R2018b
bdclose

Close any or all Simulink system windows unconditionally

Syntax

bdclose
bdclose(sys)
bdclose('all')

Description

bdclose closes the current system window unconditionally and without confirmation. Any changes made to the system since it was last saved are lost. To find out the current system, use gcs. If a model was only loaded, bdclose clears the model from memory.

bdclose(sys) closes the specified system window, discarding all changes.

bdclose('all') closes all open system windows, discarding all changes.

Examples

Close a System Without Saving

Open the vdp system. Then close it without saving any changes.

open_system(vdp)
bdclose('vdp')

Input Arguments

sys — System to close
character vector | string scalar
System to close, specified as a character vector or string scalar.
Example: "vdp"

See Also
close_system|new_system|open_system|save_system

Introduced before R2006a
**bdIsDirty**

Whether block diagram has unsaved changes

**Syntax**

\[ \text{isDirty} = \text{bdIsDirty}(\text{bdname}) \]

**Description**

\[ \text{isDirty} = \text{bdIsDirty}(\text{bdname}) \]

returns whether or not the loaded block diagram \text{bdname} has unsaved changes.

**Examples**

**Check Models for Unsaved Changes**

Check if models contain unsaved changes using \text{bdIsDirty}.

Check if a single model is dirty.

\begin{verbatim}
vdp
bdIsDirty('vdp')
\end{verbatim}

\begin{verbatim}
ans =
   logical
    0
\end{verbatim}

Check if a cell array of models are dirty.

\begin{verbatim}
vdp
sf_car
bdIsDirty({'sf_car','vdp'})
\end{verbatim}
ans =
1×2 logical array
0 0

Input Arguments

bdname — Loaded block diagram name
character vector | cell array of character vectors | double array

Loaded block diagram name, specified as a character vector, a cell array of character vectors, or a double array. All character vectors must be the names of loaded block diagrams. All doubles must be the handles of loaded block diagrams. It is an error to supply an invalid handle, a handle to anything other than a block diagram, a path to a block or subsystem, or a block diagram that is not loaded.

Data Types: double | char | cell

Output Arguments

isDirty — Whether block diagram has unsaved changes
logical scalar | logical array

Whether block diagram has unsaved changes, returned as a logical array with one entry for each block diagram. The logical value is true if the block diagram has been modified in memory since it was loaded or last saved, and false if there are no unsaved changes.

See Also

bdIsLoaded

Topics
“Manage Shadowed and Dirty Models and Other Project Files”

Introduced in R2017a
**bdIsLibrary**

Whether block diagram is a library

**Syntax**

\[
\text{isLibrary} = \text{bdIsLibrary}(\text{bdnames})
\]

**Description**

\(\text{isLibrary} = \text{bdIsLibrary}(\text{bdnames})\) returns whether the loaded block diagrams specified by \(\text{bdnames}\) are libraries.

**Examples**

**Check Whether Block Diagrams Are Libraries**

Load some block diagrams and get a handle to one of them.

```
load_system({'sf_car','hydlib','vdp'})
h = get_param('hydlib','Handle');
```

Check whether \(\text{sf_car}\) is a library. The returned value 0 indicates that it is not.

```
bdIsLibrary('sf_car')
ans =
 0
```

Check whether \(\text{hydlib}\) and \(\text{vdp}\) are libraries. The returned value shows that \(\text{hydlib}\) is a library and \(\text{vdp}\) is not.

```
bdIsLibrary({'hydlib','vdp'})
ans =
1 0
```
Using the handle to hydlib, check whether hdlib is a library. The value returned shows that it is.

bdIsLibrary(h)

ans =
1

Input Arguments

bdnames — Names or handles of loaded block diagrams
character vector | cell array of character vectors | double | array of doubles

Names or handles of loaded block diagrams, specified as a character vector, a cell array of character vectors, a double, or a double array. All character vectors are names of loaded block diagrams. All doubles are handles of loaded block diagrams.

Data Types: char | cell | double

Output Arguments

isLibrary — Logical array showing whether block diagrams are libraries
logical scalar | logical array

Logical array showing whether block diagrams are libraries, returned as a logical scalar or array (1 for a library, 0 otherwise).

See Also

bdIsLoaded | bdroot | find_system

Introduced in R2015a
bdIsLoaded

Whether block diagram is in memory

Syntax

isLoaded = bdIsLoaded(bdnames)

Description

isLoaded = bdIsLoaded(bdnames) returns whether or not a block diagram is in memory. bdnames can be a character vector or a cell array of character vectors. All character vectors must be valid block diagram names. It is an error to supply a path to a block or subsystem.

isLoaded is a logical array with one entry for each block diagram name.

Examples

bdIsLoaded('sf_car')

returns a logical scalar.

bdIsLoaded({'sf_car','vdp'})

returns a 1-by-2 logical array.

See Also

bdIsDirty | bdIsLibrary | find_system

Introduced in R2008a
**bdroot**

Top-level model of current system

**Syntax**

model = bdroot
model = bdroot(elements)

**Description**

model = bdroot returns the top-level model of the current system. The current system is the currently active Simulink Editor window or the system in which a block is selected.

model = bdroot(elements) returns the top-level model of the specified model elements. Before using bdroot, make sure the top-level model of each element in elements is loaded.

**Examples**

**Get Top-Level Model of Current System**

Open the system Controller in the model f14.

load_system('f14')
open_system('f14/Controller')

Get the top-level model of the current system.

bdroot

ans =

'f14'
Get Top-Level Model of a System

Open the system Controller in the model f14.

```matlab
load_system('f14')
open_system('f14/Controller')
```

Get the top-level model of the current system.

```matlab
bdroot(gcs)
```

```
ans =
    'f14'
```

Input Arguments

elements — Model elements whose top-level models to return

*model name | block path name | handle | cell array of character vectors | string array | numeric array*

Model elements whose top-level model to return, specified as the model name, block or system path name, handle, cell array of character vectors or string array of system names, or numeric array of handles.

**Tip** Use `bdroot` with `gcs`, `gcb`, and `gcbh` to get the top-level model of the current system or block.

Output Arguments

**model — Top-level model**

*character vector | cell array | string array*

Top-level model, returned as a character vector of the model name. If the input was an array, `model` is returned as an array of the same type as the input.

See Also

gcb | gcbh | gcs
Introduced before R2006a
dlinmod

Extract discrete-time linear state-space model around operating point

Syntax

argout = dlinmod('sys', Ts)
argout = dlinmod('sys', Ts, x, u)
argout = dlinmod('sys', Ts, x, u, para, 'v5')
argout = dlinmod('sys', Ts, x, u, para, xpert, upert, 'v5')

Arguments

sys Name of the Simulink system from which the linear model is extracted.

x, u State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing x.signals.values.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

Ts Sample time of the discrete-time linearized model
An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling `linmodv5`.

*para* A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.

- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.

- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

*xpert, upert* The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

\[
\begin{align*}
xpert &= para(1) + 1e-3 * para(1) * abs(x) \\
upert &= para(1) + 1e-3 * para(1) * abs(u)
\end{align*}
\]

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

\[
xpert = Simulink.BlockDiagram.getInitialState('sys');
\]

You can then change the perturbation values within this structure by editing *xpert*.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`. 
argout  
linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- \([A,B,C,D] = \text{linmod}('sys', x, u)\) obtains the linearized model of \(sys\) around an operating point with the specified state variables \(x\) and the input \(u\). If you omit \(x\) and \(u\), the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:

- \([\text{num}, \text{den}] = \text{linmod}('sys', x, u)\) returns the linearized model in transfer function form.
- \(\text{sys} \_\text{struc} = \text{linmod}('sys', x, u)\) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

**Description**

dlinmod compute a linear state-space model for a discrete-time system by linearizing each block in a model individually.

linmod obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.
Discrete-Time System Linearization

The function `dlinmod` can linearize discrete, multirate, and hybrid continuous and discrete systems at any given sampling time. Use the same calling syntax for `dlinmod` as for `linmod`, but insert the sample time at which to perform the linearization as the second argument. For example,

```
[Ad,Bd,Cd,Dd] = dlinmod('sys', Ts, x, u);
```

produces a discrete state-space model at the sampling time `Ts` and the operating point given by the state vector `x` and input vector `u`. To obtain a continuous model approximation of a discrete system, set `Ts` to 0.

For systems composed of linear, multirate, discrete, and continuous blocks, `dlinmod` produces linear models having identical frequency and time responses (for constant inputs) at the converted sampling time `Ts`, provided that

- `Ts` is an integer multiple of all the sampling times in the system.
- The system is stable.

For systems that do not meet the first condition, in general the linearization is a time-varying system, which cannot be represented with the `[A,B,C,D]` state-space model that `dlinmod` returns.

Computing the eigenvalues of the linearized matrix `Ad` provides an indication of the stability of the system. The system is stable if `Ts>0` and the eigenvalues are within the unit circle, as determined by this statement:

```
all(abs(eig(Ad))) < 1
```

Likewise, the system is stable if `Ts = 0` and the eigenvalues are in the left half plane, as determined by this statement:

```
all(real(eig(Ad))) < 0
```

When the system is unstable and the sample time is not an integer multiple of the other sampling times, `dlinmod` produces `Ad` and `Bd` matrices, which can be complex. The eigenvalues of the `Ad` matrix in this case still, however, provide a good indication of stability.

You can use `dlinmod` to convert the sample times of a system to other values or to convert a linear discrete system to a continuous system or vice versa.
You can find the frequency response of a continuous or discrete system by using the `bode` command.

**Notes**

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose `i`th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the `v5` algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`linmod` | `linmod2` | `linmodv5`

**Introduced in R2007a**
close_system

Close Simulink system window or block dialog box

Syntax

close_system
close_system(blockOrSys)
close_system(sys,saveflag)
close_system(sys,newsys)
close_system(sys,newsys,Name,Value)

Description

close_system closes the current system or subsystem. If the current system is the top-level model and has been modified, close_system returns an error.

Use the gcs function to determine the current system.

**Note** You cannot use close_system in a block or menu callback to close the root-level model. Attempting to close the root-level model in a block or menu callback causes an error and discontinues the callback execution.

close_system(blockOrSys) closes the specified model, subsystem, or the block dialog box of the specified block. If the model was only loaded, that is, with load_system, this syntax clears the model from memory.

close_system(sys,saveflag) lets you specify whether to save the model with its current name or to close without saving.

close_system(sys,newsys) saves the model to a file with the specified name before closing.

close_system(sys,newsys,Name,Value) closes and saves the model with additional options specified by one or more Name,Value pair arguments.
Examples

Close the Current System

Open the model vdp and then close it.

vdp
close_system

Close a Block Dialog Box

Open the model vdp.

vdp

In the model, to open its block dialog box, double-click the block Mu.

Close the block dialog box

close_system('vdp/Mu');

Close a Model and Save with New Name

Open a model, modify it, save the model with a new name and close it.

Open the model vdp and add a block to it.

vdp
block = add_block('vdp/Mu','vdp/Mu','MakeNameUnique','on');

Close the model, saving it with a new name.

close_system('vdp','myvdp');

Close a Model Using Name,Value Options

This command tries to save the vdp system to a file with the name 'max', but returns an error because 'max' is the name of an existing MATLAB function.
close_system('vdp','max','ErrorIfShadowed',true)

**Input Arguments**

`blockOrSys` — Block, model, or subsystem to close  
character vector | cell array of character vectors | string array | handle | array of handles

Name of model, subsystem, or the block whose dialog box you want to close, specified as a character vector, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

Example: "vdp/Mu" 'vdp'

`sys` — Name of model to close  
character vector | cell array of character vectors | string array | handle | array of handles

Name of model to close, specified as a character vector, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

`saveflag` — Option to save file with current name  
0 (default) | 1 | numeric array

Option to save model using the current file name, specified as 0 to close without saving or 1 to save and then close. If `sys` is an array, you can supply a single character to apply to all of the models in the array. Or you can provide a numeric array with values that correspond with each model in the `sys` array.

For information on rules for naming models, see “Model Names”.

`newsys` — File to save to  
character vector | cell array of character vectors | string array

File to save to, specified as a character vector, cell array of character vectors, or string array. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, `close_system` saves to the file format specified in your Simulink preferences. Possible model extensions are `.slx` and `.mdl`.

For information on rules for naming models, see “Model Names”.
Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example:
save_system('mymodel','newmodel','SaveModelWorkspace',true,'BreakUse rLinks',true,'OverwriteIfChangedOnDisk',true)

**ErrorIfShadowed — Return an error if name exists**
false (default) | true | 'on' | 'off'

Option to return an error if the new name exists on the MATLAB path or workspace, specified as true, false, 'on', or 'off'.

**OverwriteIfChangedOnDisk — Overwrite file**
false (default) | true | 'on' | 'off'

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as true, false, 'on', or 'off'. By default, if the file changed on disk since the model was loaded, close_system displays an error to prevent the changes on disk from being overwritten.

If the file has changed on disk, you can control whether save_system displays an error using a Simulink preference. In the Model File pane of the Simulink Preferences dialog box, under Change Notification, select Saving the model. This preference is on by default.

**SaveModelWorkspace — Save model workspace**
false (default) | true | 'on' | 'off'

Option to save the contents of the model workspace, specified as true, false, 'on', or 'off'. The model workspace DataSource must be a MAT-file. If the data source is not a MAT-file, save_system does not save the workspace. See “Specify Source for Data in Model Workspace”.

**See Also**
bdclose | gcs | load_system | new_system | open_system | save_system
Introduced before R2006a
**closeDialog**

Close configuration parameters dialog

**Syntax**

closeDialog(configObj)

**Arguments**

*configObj*

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

**Description**

closeDialog closes an open configuration parameters dialog box. If `configObj` is a configuration set, the function closes the dialog box that displays the configuration set. If `configObj` is a configuration reference, the function closes the dialog box that displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already closed, the function does nothing.

**Examples**

The following example closes a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```matlab
myConfigObj = getActiveConfigSet(gcs);
closeDialog(myConfigObj);
```

Introduced in R2006b
close

(Not recommended) Close project

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead of `simulinkproject`. For more information, see “Compatibility Considerations”.

**Syntax**

close(proj)

**Description**

close(proj) closes the project `proj`.

**Examples**

**Open and Close a Project**

Open a specified project and get a project object to manipulate the project at the command line. For example,

```matlab
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Close the project.

close(proj)

**Input Arguments**

`proj` — Project

project object
Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

Compatibility Considerations

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

**Functions**

`simulinkproject`

**Introduced in R2013a**
coder.allowpcode

Package: coder

Control code generation from protected MATLAB files

Syntax

coder.allowpcode('plain')

Description

coder.allowpcode('plain') allows you to generate protected MATLAB code (P-code) that you can then compile into optimized MEX functions or embeddable C/C++ code. This function does not obfuscate the generated MEX functions or embeddable C/C++ code.

With this capability, you can distribute algorithms as protected P-files that provide code generation optimizations, providing intellectual property protection for your source MATLAB code.

Call this function in the top-level function before control-flow statements, such as if, while, switch, and function calls.

MATLAB functions can call P-code. When the .m and .p versions of a file exist in the same folder, the P-file takes precedence.

coder.allowpcode is ignored outside of code generation.

Examples

Generate optimized embeddable code from protected MATLAB code:

1. Write an function p_abs that returns the absolute value of its input:

   function out = p_abs(in)   %#codegen
   % The directive %#codegen indicates that the function
   % The code generation directives are used as comments in the code generation process.
% is intended for code generation
coder.allowpcode('plain');
out = abs(in);

2 Generate protected P-code. At the MATLAB prompt, enter:

```
pcode p_abs
```

The P-file, `p_abs.p`, appears in the current folder.

3 Generate a MEX function for `p_abs.p`, using the `-args` option to specify the size, class, and complexity of the input parameter (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -args { int32(0) }
```

codegen generates a MEX function in the current folder.

4 Generate embeddable C code for `p_abs.p` (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -config:lib -args { int32(0) };
```

codegen generates C library code in the `codegen\lib\p_abs` folder.

Introduced in R2011a
coder.ceval

Call external C/C++ function

Syntax

coder.ceval(cfun_name)
coder.ceval(cfun_name,cfun_arguments)

coder.ceval('-global',cfun_name)
coder.ceval('-global',cfun_name,cfun_arguments)

coder.ceval('-layout:rowMajor',cfun_name,cfun_arguments)
coder.ceval('-layout:columnMajor',cfun_name,cfun_arguments)
coder.ceval('-layout:any',cfun_name,cfun_arguments)

cfun_return = coder.ceval(__)

Description

coder.ceval(cfun_name) executes the external C/C++ function specified by cfun_name. Define cfun_name in an external C/C++ source file or library. Provide the external source, library, and header files to the code generator.

coder.ceval(cfun_name,cfun_arguments) executes cfun_name with arguments cfun_arguments. cfun_arguments is a comma-separated list of input arguments in the order that cfun_name requires.

By default, coder.ceval passes arguments by value to the C/C++ function whenever C/C++ supports passing arguments by value. To make coder.ceval pass arguments by reference, use the constructs coder.ref, coder.rref, and coder.wref. If C/C++ does not support passing arguments by value, for example, if the argument is an array, coder.ceval passes arguments by reference. If you do not use coder.ref, coder.rref or coder.wref, a copy of the argument can appear in the generated code to enforce MATLAB semantics for arrays.
coder.ceval('-global', cfun_name) executes cfun_name and indicates that cfun_name uses one or more MATLAB global variables. The code generator can then produce code that is consistent with this global variable usage.

coder.ceval('-global', cfun_name, cfun_arguments) executes cfun_name with arguments cfun_arguments and indicates that cfun_name uses one or more MATLAB global variables.

coder.ceval('-layout:rowMajor', cfun_name, cfun_arguments) executes cfun_name with arguments cfun_arguments and passes data stored in row-major layout. When called from a function that uses column-major layout, the code generator converts inputs to row-major layout and converts outputs back to column-major layout. For a shorter syntax, use coder.ceval('-row', ...).

coder.ceval('-layout:columnMajor', cfun_name, cfun_arguments) executes cfun_name with arguments cfun_arguments and passes data stored in column-major layout. When called from a function that uses row-major layout, the code generator converts inputs to column-major layout and converts outputs back to row-major layout. For a shorter syntax, use coder.ceval('-col', ...).

coder.ceval('-layout:any', cfun_name, cfun_arguments) executes cfun_name with arguments cfun_arguments and passes data with its current array layout, even when array layouts do not match. The code generator does not convert the array layout of the input or output data.

cfun_return = coder.ceval(____) executes cfun_name and returns a single scalar value, cfun_return, corresponding to the value that the C/C++ function returns in the return statement. To be consistent with C/C++, coder.ceval can return only a scalar value. It cannot return an array. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Call External C Function

Call a C function foo(u) from a MATLAB function from which you intend to generate C code.

Create a C header file foo.h for a function foo that takes two input parameters of type double and returns a value of type double.
double foo(double in1, double in2);

Write the C function foo.c.

#include <stdio.h>
#include <stdlib.h>
#include "foo.h"

double foo(double in1, double in2)
{
    return in1 + in2;
}

Write a function callfoo that calls foo by using coder.ceval. Provide the source and header files to the code generator in the function.

function y = callfoo  %#codegen
y = 0.0;
if coder.target('MATLAB')
    % Executing in MATLAB, call MATLAB equivalent of
    % C function foo
    y = 10 + 20;
else
    % Executing in generated code, call C function foo
    coder.updateBuildInfo('addSourceFiles','foo.c');
    coder.cinclude('foo.h');
    y = coder.ceval('foo', 10, 20);
end
end

Generate C library code for function callfoo. The codegen function generates C code in the \codegen\lib\callfoo subfolder.

codegen -config:lib callfoo -report

Call a C Library Function

Call a C library function from MATLAB code.

Write a MATLAB function myabsval.
function y = myabsval(u)
    %#codegen
    y = abs(u);

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

codegen -config:lib myabsval -args {0.0}

The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `codegen/lib/myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

function y = callmyabsval(y)
    %#codegen
    % Check the target. Do not use `coder.ceval` if `callmyabsval` is
    % executing in MATLAB
    if coder.target('MATLAB')
        % Executing in MATLAB, call function `myabsval`
        y = myabsval(y);
    else
        % add the required include statements to generated function code
        coder.updateBuildInfo('addIncludePaths','$(START_DIR)/codegen/lib/myabsval');
        coder.cinclude('myabsval_initialize.h');
        coder.cinclude('myabsval.h');
        coder.cinclude('myabsval_terminate.h');

        % Executing in the generated code.
        % Call the initialize function before calling the
        % C function for the first time
        coder.ceval('myabsval_initialize');

        % Call the generated C library function `myabsval`
        y = coder.ceval('myabsval',y);

        % Call the terminate function after
        % calling the C function for the last time
        coder.ceval('myabsval_terminate');
    end

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args \{-2.75\}

Rather than providing the library at the command line, you can use coder.updateBuildInfo to specify the library within the function. Use this option to preconfigure the build. Add this line to the else block:

coder.updateBuildInfo('addLinkObjects','myabsval.lib','$(START_DIR)\codegen\lib\myabsval',100,true,true);

Run the MEX function callmyabsval_mex which calls the library function myabsval.

callmyabsval_mex(-2.75)

ans =

   2.7500

Call the MATLAB function callmyabsval.

callmyabsval(-2.75)

ans =

   2.7500

The callmyabsval function exhibits the desired behavior for execution in MATLAB and in code generation.

Call C Function That Uses Global Variable

Use the '-global' flag when you call a C function that modifies a global variable.

Write a MATLAB function useGlobal that calls a C function addGlobal. Use the '-global' flag to indicate to the code generator that the C function uses a global variable.

function y = useGlobal()
    global g;
    t = g;
    % compare execution with/without '-global' flag
    coder.ceval('-global','addGlobal');
    y = t;
end

Create a C header file addGlobal.h for the function addGlobal.

2-75
void addGlobal(void);

Write the C function addGlobal in the file addGlobal.c. This function includes the header file useGlobal_data.h that the code generator creates when you generate code for the function useGlobal. This header file contains the global variable declaration for g.

#include "addGlobal.h"
#include "useGlobal_data.h"
void addGlobal(void) {
    g++;
}

Generate the MEX function for useGlobal. To define the input to the code generator, declare the global variable in the workspace.

global g;
g = 1;
codegen useGlobal -report addGlobal.h addGlobal.c
y = useGlobal_mex();

With the '-global' flag, the MEX function produces the result y = 1. The '-global' flag indicates to the code generator that the C function possibly modifies the global variable. For useGlobal, the code generator produces this code:

real_T useGlobal(const emlrtStack *sp)
{
    real_T y;
    (void)sp;
    y = g;
    addGlobal();
    return y;
}

Without the '-global' flag, the MEX function produces y = 2. Because there is no indication that the C function modifies g, the code generator assumes that y and g are identical. This C code is generated:

real_T useGlobal(const emlrtStack *sp)
{
    (void)sp;
    addGlobal();
}
Call C Function That Uses Different Array Layout

Suppose that you have a C function `testRM` that is designed to use row-major layout. You want to integrate this function into a MATLAB function `bar` that operates on arrays. The function `bar` is designed to use column-major layout, employing the `coder.columnMajor` directive.

```matlab
function out = bar(in)
%#codegen
coder.columnMajor;
coder.ceval('-layout:rowMajor','testRM', ...
    coder.rref(in),coder.wref(out));
end
```

In the generated code, the code generator inserts a layout conversion from column-major layout to row-major layout on the variable `in` before passing it to `testRM`. On the output variable `out`, the code generator inserts a layout conversion back to column-major.

In general, if you do not specify the `layout` option for `coder.ceval`, the external function arguments are assumed to use column-major.

Input Arguments

- **cfun_name — C/C++ function name**
  character vector | string scalar
  Name of external C/C++ function to call.
  Example: `coder.ceval('foo')`
  Data Types: char | string

- **cfun_arguments — C/C++ function arguments**
  scalar variable | array | element of an array | structure | structure field | object property
  Comma-separated list of input arguments in the order that `cfun_name` requires.
  Example: `coder.ceval('foo', 10, 20);`
Example: `coder.ceval('myFunction', coder.ref(x));`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`

Complex Number Support: Yes

**Limitations**

- You cannot use `coder.ceval` on functions that you declare extrinsic with `coder.extrinsic`.
- When the LCC compiler creates a library, it adds a leading underscore to the library function names. If the compiler for the library was LCC and your code generation compiler is not LCC, you must add the leading underscore to the function name, for example, `coder.ceval('_mylibfun')`. If the compiler for a library was not LCC, you cannot use LCC to generate code from MATLAB code that calls functions from that library. Those library function names do not have the leading underscore that the LCC compiler requires.
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

**Tips**

- For code generation, before calling `coder.ceval`, you must specify the type, size, and complexity data type of return values and output arguments.
- To apply `coder.ceval` to a function that accepts or returns variables that do not exist in MATLAB code, such as pointers, FILE types for file I/O, and C/C++ macros, use the `coder.opaque` function.
- Use `coder.ceval` only in MATLAB for code generation. `coder.ceval` generates an error in uncompiled MATLAB code. To determine if a MATLAB function is executing in MATLAB, use `coder.target`. If the function is executing in MATLAB, call the MATLAB version of the C/C++ function.

“Interface with Row-Major Data in MATLAB Function Block”
“Unknown Output Type for coder.ceval”

Introduced in R2011a
**coder.cinclude**

Include header file in generated code

**Syntax**

```matlab
coder.cinclude(headerfile)
coder.cinclude(headerfile,'InAllSourceFiles',allfiles)
```

**Description**

coder.cinclude(headerfile) includes a header file in generated C/C++ source code.

MATLAB Coder generates the include statement in the C/C++ source files that are generated from the MATLAB code that contains the coder.cinclude call.

In a Simulink model, when a coder.cinclude call appears in a MATLAB Function block, the code generator puts the include statement in the model header file.

coder.cinclude(headerfile,'InAllSourceFiles',allfiles) uses the allfiles option to determine whether to include the header file in almost all C/C++ source files.

If allfiles is true, MATLAB Coder generates the include statement in almost all C/C++ source files, except for some utility files. This behavior is the coder.cinclude behavior from R2016a and earlier releases. The presence of the include statement in these additional files can increase compile time and make the generated code less readable. Use this option only if your code depends on the legacy behavior. If allfiles is false, the behavior is the same as the behavior of coder.cinclude(headerfile).

In a MATLAB Function block, coder.cinclude(headerfile,'InAllSourceFiles',allfiles) is the same as coder.cinclude(headerfile).

**Examples**
Include Header File in C/C++ Code Generated by Using the MATLAB Coder codegen Command

Generate code from a MATLAB function that calls an external C function. Use coder.cinclude to include the required header file in the generated C code.

In a writable folder, create a subfolder mycfiles.

Write a C function myMult2.c that doubles its input. Save it in mycfiles.

```c
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file myMult2.h. Save it in mycfiles.

```c
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Write a MATLAB function, myfunc, that includes myMult2.h and calls myMult2 for code generation only.

```matlab
function y = myfunc
%#codegen
y = 21;
if ~coder.target('MATLAB')
    % Running in generated code
    coder.cinclude('myMult2.h');
    y = coder.ceval('myMult2', y);
else
    % Running in MATLAB
    y = y * 2;
end
end
```

Create a code configuration object for a static library. Specify the locations of myMult2.h and myMult2.c

```matlab
cfg = coder.config('lib');
cfg.CustomInclude = fullfile(pwd,'mycfiles');
cfg.CustomSource = fullfile(pwd,'mycfiles','myMult2.c');
```
Generate the code.

codegen -config cfg myfunc -report

The file myfunc.c contains this statement:

#include "myMult2.h"

The include statement does not appear in any other file.

Include Header File in C/C++ Code Generated from a MATLAB Function Block in a Simulink Model

Generate code from a MATLAB Function block that calls an external C function. Use coder.cinclude to include the required header file in the generated C code.

In a writable folder, create a subfolder mycfiles.

Write a C function myMult2.c that doubles its input. Save it in mycfiles.

#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}

Write the header file myMult2.h. Save it in mycfiles.

#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif

Create a Simulink model that contains a MATLAB Function block connected to an Outport block.
In the MATLAB Function block, add the function `myfunc` that includes `myMult2.h` and calls `myMult2`.

```matlab
function y = myfunc
%#codegen
y = 21;
coder.cinclude('myMult2.h');
y = coder.ceval('myMult2', y);
% Specify the locations of myMult2.h and myMult2.c
coder.extrinsic('pwd', 'fullfile');
customDir = coder.const(fullfile(pwd, 'mycfiles'));
coder.updateBuildInfo('addIncludePaths', customDir);
coder.updateBuildInfo('addSourcePaths', customDir);
coder.updateBuildInfo('addSourceFiles', 'myMult2.c');
end
```

Open the Configuration Parameters dialog box.

On the **Solver** pane, select a fixed-step solver.

Save the model as `mymodel`.

Build the model.

The file `mymodel.h` contains this statement:

```
#include "myMult2.h"
```

To read more about integrating custom code in a MATLAB Function block, see “Integrate C Code Using the MATLAB Function Block”.

**Input Arguments**

- **headerfile** — Name of header file
  
  character vector | string scalar

  Name of a header file specified as a character vector or string scalar. `headerfile` must be a compile-time constant.

  Enclose a system header file name in angle brackets `< >`. The generated `#include` statement for a system header file has the format `#include <sysheader>`. A system header file must be in a standard location or on the include path. Specify the include path by using code generation custom code parameters.
Example: `coder.cinclude('<sysheader.h>')`

For a header file that is not a system header file, omit the angle brackets. The generated `#include` statement for a header file that is not a system header file has the format `#include "myHeader"`. The header file must be in the current folder or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude('myheader.h')`

Data Types: `char`

**allfiles — All source files option**

true | false

Option to include header file in all generated C/C++ source files. If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all of the C/C++ source files, except for some utility files. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, the code generator ignores the all source files option.

Data Types: `logical`

**Limitations**

- Do not call `coder.cinclude` inside run-time conditional constructs such as `if` statements, `switch` statements, `while-loops`, and `for-loops`. You can call `coder.cinclude` inside compile-time conditional statements, such as `coder.target`. For example:

```...  
if ~coder.target('MATLAB')  
  coder.cinclude('foo.h');  
  coder.ceval('foo');  
end  
...```

**Tips**

- Before a `coder.ceval` call, call `coder.cinclude` to include the header file required by the external function that `coder.ceval` calls.
• Extraneous include statements in generated C/C++ code can increase compile time and reduce code readability. To avoid extraneous include statements in code generated by MATLAB Coder, follow these best practices:
  
  • Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.
  • Do not set `allfiles` to `true`.

For the MATLAB Function block, the code generator generates the include statement in the model header file.

• In R2016a and earlier releases, for any `coder.cinclude` call, MATLAB Coder included the header file in almost all generated C/C++ source files, except for some utility files. If you have code that depends on this legacy behavior, you can preserve the legacy behavior by using this syntax:

```
coder.cinclude(headerfile,'InAllSourceFiles',true)
```

**See Also**
`coder.ceval` | `coder.target`

**Topics**
“Model Configuration Parameters: Code Generation Custom Code” (Simulink Coder)

**Introduced in R2013a**
**coder.columnMajor**

Specify column-major array layout for a function or class

**Syntax**

coder.columnMajor

**Description**

coder.columnMajor specifies column-major array layout for the data used by the current function in generated code. When placed in a class constructor, coder.columnMajor specifies column-major layout for data used by the class.

**Examples**

**Specify Column-Major Array Layout for a Function**

Specify column-major array layout for a function by inserting coder.columnMajor into the function body.

Suppose that myFunction is the top-level function of your code. Your application requires you to perform matrix addition with column-major array layout and matrix multiplication with row-major layout.

```matlab
function S = myFunction(A,B)
    %#codegen
    if size(A,1) ~= size(B,1) || size(A,2) ~= size(B,2)
        disp('Matrices must be same size.')
        return;
    end
    B = B*B';
    A = A*A';
```
% add matrices
S = addMatrix(A,B);
end

Write a function for matrix addition called addMatrix. Specify column-major for addMatrix by using coder.columnMajor.

function S = addMatrix(A,B)
%#codegen
S = zeros(size(A));
coder.columnMajor; % specify column-major array layout
S = A + B;
end

Generate code for myFunction. Use the codegen command.

codegen myFunction -args {ones(10,20),ones(10,20)} -config:lib -launchreport -rowmajor

Because of the codegen -rowmajor option, the matrix multiplication in myFunction uses row-major layout. However, the generated code for addMatrix uses column-major array layout due to the coder.columnMajor call.

Tips

• The code generator uses column-major array layout by default.
• The specification of array layout inside a function supersedes the array layout specified with the codegen command. For example, if the function foo contains coder.columnMajor, and you generate code by using:

codegen foo -rowmajor

then the generated code still uses column-major layout.
• Other functions called from within a column-major function inherit the column-major specification. However, if one of the called functions has its own distinct coder.rowMajor call, the code generator changes the array layout accordingly. If a row-major function and a column-major function call the same function, which does not have its own array layout specification, the code generator produces a row-major version and column-major version of the function.
• coder.columnMajor is ignored outside of code generation and simulation.

Topics

“Interface with Row-Major Data in MATLAB Function Block”
“Specify Array Layout in Functions and Classes”
“Code Generation of Matrices and Arrays” (Simulink Coder)

Introduced in R2018a
**coder.const**

Fold expressions into constants in generated code

**Syntax**

\[ \text{out} = \text{coder.const(} \text{expression} \text{)} \]

\[ [\text{out1},...,\text{outN}] = \text{coder.const(} \text{handle,} \text{arg1},...,\text{argN} \text{)} \]

**Description**

\( \text{out} = \text{coder.const(} \text{expression} \text{)} \) evaluates \( \text{expression} \) and replaces \( \text{out} \) with the result of the evaluation in generated code.

\[ [\text{out1},...,\text{outN}] = \text{coder.const(} \text{handle,} \text{arg1},...,\text{argN} \text{)} \] evaluates the multi-output function having handle \( \text{handle} \). It then replaces \( \text{out1},...,\text{outN} \) with the results of the evaluation in the generated code.

**Examples**

**Specify Constants in Generated Code**

This example shows how to specify constants in generated code using \texttt{coder.const}.

Write a function AddShift that takes an input \texttt{Shift} and adds it to the elements of a vector. The vector consists of the square of the first 10 natural numbers. AddShift generates this vector.

\begin{verbatim}
function y = AddShift(Shift) %#codegen
y = (1:10).^2+Shift;
\end{verbatim}

Generate code for AddShift using the \texttt{codegen} command. Open the Code Generation Report.

\begin{verbatim}
codegen -config:lib -launchreport AddShift -args 0
\end{verbatim}
The code generator produces code for creating the vector. It adds Shift to each element of the vector during vector creation. The definition of AddShift in generated code looks as follows:

```c
void AddShift(double Shift, double y[10])
{
    int k;
    for (k = 0; k < 10; k++) {
        y[k] = (double)((1 + k) * (1 + k)) + Shift;
    }
}
```

Replace the expression `(1:10).^2` with `coder.const((1:10).^2)`, and then generate code for AddShift again using the codegen command. Open the Code Generation Report.

```bash
codegen -config:lib -launchreport AddShift -args 0
```

The code generator creates the vector containing the squares of the first 10 natural numbers. In the generated code, it adds Shift to each element of this vector. The definition of AddShift in generated code looks as follows:

```c
void AddShift(double Shift, double y[10])
{
    int i;
    static const signed char iv[10] = { 1, 4, 9, 16, 25, 36,
    49, 64, 81, 100 };

    for (i = 0; i < 10; i++) {
        y[i] = (double)iv[i] + Shift;
    }
}
```

Create Lookup Table in Generated Code

This example shows how to fold a user-written function into a constant in generated code.

Write a function `getsine` that takes an input `index` and returns the element referred to by `index` from a lookup table of sines. The function `getsine` creates the lookup table using another function `gettable`.

```matlab
function y = getsine(index) %#codegen
    assert(isa(index, 'int32'))
```
persistent tbl;
if isempty(tbl)
    tbl = gettable(1024);
end
y = tbl(index);

function y = gettable(n)
    y = zeros(1,n);
    for i = 1:n
        y(i) = sin((i-1)/(2*pi*n));
    end
end

Generate code for getsine using an argument of type int32. Open the Code Generation Report.

codegen -config:lib -launchreport getsine -args int32(0)

The generated code contains instructions for creating the lookup table.

Replace the statement:

tbl = gettable(1024);

with:

tbl = coder.const(gettable(1024));

Generate code for getsine using an argument of type int32. Open the Code Generation Report.

The generated code contains the lookup table itself. coder.const forces the expression gettable(1024) to be evaluated during code generation. The generated code does not contain instructions for the evaluation. The generated code contains the result of the evaluation itself.

**Specify Constants in Generated Code Using Multi-Output Function**

This example shows how to specify constants in generated code using a multi-output function in a coder.const statement.
Write a function `MultiplyConst` that takes an input `factor` and multiplies every element of two vectors `vec1` and `vec2` with `factor`. The function generates `vec1` and `vec2` using another function `EvalConsts`.

```matlab
function [y1,y2] = MultiplyConst(factor) %#codegen
    [vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
    y1=vec1.*factor;
    y2=vec2.*factor;
end

function [f1,f2]=EvalConsts(z,n)
    f1=z.^(2*n)/factorial(2*n);
    f2=z.^(2*n+1)/factorial(2*n+1);
end
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

codegen -config:lib -launchreport MultiplyConst -args 0

The code generator produces code for creating the vectors. Replace the statement

```
[vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
```

with

```
[vec1,vec2]=coder.const(@EvalConsts,pi.*(1./2.^(1:10)),2);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

codegen -config:lib -launchreport MultiplyConst -args 0

The code generator does not generate code for creating the vectors. Instead, it calculates the vectors and specifies the calculated vectors in generated code.

**Read Constants by Processing XML File**

This example shows how to call an extrinsic function using `coder.const`.

Write an XML file `Myparsr.xml` containing the following statements:

```
<params>
    <param name="hello" value="17"/>
</params>
```
Save MyParams.xml in the current folder.

Write a MATLAB function `xml2struct` that reads an XML file. The function identifies the XML tag `param` inside another tag `params`.

After identifying `param`, the function assigns the value of its attribute `name` to the field `name` of a structure `s`. The function also assigns the value of attribute `value` to the value of the field.

```matlab
function s = xml2struct(file)
    s = struct();
    doc = xmlread(file);
    els = doc.getElementsByTagName('params');
    for i = 0:els.getLength-1
        it = els.item(i);
        ps = it.getElementsByTagName('param');
        for j = 0:ps.getLength-1
            param = ps.item(j);
            paramName = char(param.getAttribute('name'));
            paramValue = char(param.getAttribute('value'));
            paramValue = evalin('base', paramValue);
            s.(paramName) = paramValue;
        end
    end
end
```

Save `xml2struct` in the current folder.

Write a MATLAB function `MyFunc` that reads the XML file `MyParams.xml` into a structure `s` using the function `xml2struct`. Declare `xml2struct` as extrinsic using `coder.extrinsic` and call it in a `coder.const` statement.

```matlab
function y = MyFunc(u) %#codegen
    assert(isa(u, 'double'));
    coder.extrinsic('xml2struct');
    s = coder.const(xml2struct('MyParams.xml'));
    y = s.hello + s.world + u;
end
```

Generate code for `MyFunc` using the `codegen` command. Open the Code Generation Report.

codegen -config:dll -launchreport MyFunc -args 0
The code generator executes the call to `xml2struct` during code generation. It replaces the structure fields `s.hello` and `s.world` with the values 17 and 42 in generated code.

**Input Arguments**

*expression* — MATLAB expression or user-written function

expression with constants | single-output function with constant arguments

MATLAB expression or user-defined single-output function.

The expression must have compile-time constants only. The function must take constant arguments only. For instance, the following code leads to a code generation error, because `x` is not a compile-time constant.

```matlab
function y=func(x)
    y=coder.const(log10(x));
```

To fix the error, assign `x` to a constant in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```bash
codegen -config:lib func -args coder.Constant(10)
```

Example: `2*pi`, `factorial(10)`

**handle** — Function handle

Handle to built-in or user-written function.

Example: `@log`, `@sin`

Data Types: `function_handle`

*arg1,...,argN* — Arguments to the function with handle handle

Arguments to the function with handle `handle`.

The arguments must be compile-time constants. For instance, the following code leads to a code generation error, because `x` and `y` are not compile-time constants.

```matlab
function y=func(x,y)
    y=coder.const(@nchoosek,x,y);
```
To fix the error, assign \( x \) and \( y \) to constants in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args {coder.Constant(10),coder.Constant(2)}
```

## Output Arguments

- **out** — Value of expression
  value of the evaluated expression

Value of expression. In the generated code, MATLAB Coder replaces occurrences of `out` with the value of expression.

- **out1,...,outN** — Outputs of the function with handle handle
  values of the outputs of the function with handle handle

Outputs of the function with handle handle. MATLAB Coder evaluates the function and replaces occurrences of `out1,...,outN` with constants in the generated code.

## Tips

- When possible, the code generator constant-folds expressions automatically. Typically, automatic constant-folding occurs for expressions with scalars only. Use `coder.const` when the code generator does not constant-fold expressions on its own.

- When constant-folding computationally intensive function calls, to reduce code generation time, make the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:

  ```
  function j = fcn(z)
  zTable = coder.const(0:0.01:100);
  jTable = coder.const(feval('besselj',3,zTable));
  j = interp1(zTable,jTable,z);
  end
  ```

  See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

- If `coder.const` is unable to constant-fold a function call, try to force constant-folding by making the function call extrinsic. The extrinsic function call causes evaluation of the function call by MATLAB instead of by the code generator. For example:
function yi = fcn(xi)
y = coder.const(feval('rand',1,100));
yi = interp1(y,xi);
end

See “Use coder.const with Extrinsic Function Calls” (MATLAB Coder).

“Use coder.const with Extrinsic Function Calls” (MATLAB Coder)

Introduced in R2013b
**coder.cstructname**

Package: coder

Name C structure type in generated code

**Syntax**

```matlab
coder.cstructname(var, structName)
coder.cstructname(var, structName, 'extern', 'HeaderFile', headerfile)
coder.cstructname(var, structName, 'extern', 'HeaderFile',
                 headerfile, 'Alignment', alignment)
```

```matlab
outtype = coder.cstructname(intype, structName)
outtype = coder.cstructname(intype, structName, 'extern', 'HeaderFile',
                             headerfile)
outtype = coder.cstructname(intype, structName, 'extern', 'HeaderFile',
                             headerfile, 'Alignment', alignment)
```

**Description**

coder.cstructname names the generated or externally defined C structure type to use for MATLAB variables that are represented as structures in generated code.

coder.cstructname(var, structName) names the C structure type generated for the MATLAB variable var. The input var can be a structure or a cell array. Use this syntax in a function from which you generate code. Place coder.cstructname after the definition of var and before the first use of var. If var is an entry-point (top-level) function input argument, place coder.cstructname at the beginning of the function, before any control flow statements.

coder.cstructname(var, structName, 'extern', 'HeaderFile', headerfile) specifies that the C structure type to use for var has the name structName and is defined in the external file, headerfile.
It is possible to use the 'extern' option without specifying the header file. However, it is a best practice to specify the header file so that the code generator produces the `#include` statement in the correct location.

coder.cstructname(var,structName,'extern','HeaderFile', headerfile,'Alignment',alignment) also specifies the run-time memory alignment for the externally defined structure type structName. If you have Embedded Coder and use custom Code Replacement Libraries (CRLs), specify the alignment so that the code generator can match CRL functions that require alignment for structures. See “Data Alignment for Code Replacement” (Embedded Coder).

outtype = coder.cstructname(intype,structName) returns a structure or cell array type object outtype that specifies the name of the C structure type to generate. coder.cstructname creates outtype with the properties of the input type intype. Then, it sets the TypeName property to structName. Use this syntax to create a type object that you use with the codegen -args option. You cannot use this syntax in a function from which you generate code.

You cannot use this syntax in a MATLAB Function block.

outtype = coder.cstructname(intype,structName,'extern','HeaderFile', headerfile) returns a type object outtype that specifies the name and location of an externally defined C structure type. The code generator uses the externally defined structure type for variables with type outtype.

You cannot use this syntax in a MATLAB Function block.

outtype = coder.cstructname(intype,structName,'extern','HeaderFile', headerfile,'Alignment',alignment) creates a type object outtype that also specifies the C structure type alignment.

You cannot use this syntax in a MATLAB Function block.

**Examples**

**Name the C Structure Type for a Variable in a Function**

In a MATLAB function, `myfun`, assign the name `MyStruct` to the generated C structure type for the variable `v`. 
function y = myfun()
    %#codegen
    v = struct('a',1,'b',2);
    coder.cstructname(v, 'myStruct');
    y = v;
end

Generate standalone C code. For example, generate a static library.

codegen -config:lib myfun -report

To see the generated structure type, open codegen/lib/myfun/myfun_types.h or view myfun_types.h in the code generation report. The generated C structure type is:

typedef struct {
    double a;
    double b;
} myStruct;

**Name the C Structure Type Generated for a Substructure**

In a MATLAB function, myfun1, assign the name MyStruct to the generated C structure type for the structure v. Assign the name mysubStruct to the structure type generated for the substructure v.b.

function y = myfun()
    %#codegen
    v = struct('a',1,'b',struct('f',3));
    coder.cstructname(v, 'myStruct');
    coder.cstructname(v.b, 'mysubStruct');
    y = v;
end

The generated C structure type mysubStruct is:

typedef struct {
    double f;
} mysubStruct;

The generated C structure type myStruct is:

typedef struct {
    double a;
} myStruct;
mysubStruct b;
} myStruct;

Name the Structure Type Generated for a Cell Array

In a MATLAB function, myfun2, assign the name myStruct to the generated C structure type for the cell array c.

```matlab
function z = myfun2()
c = {1 2 3};
coder.cstructname(c,'myStruct')
z = c;
```

The generated C structure type for c is:

```c
typedef struct {
   double f1;
   double f2;
   double f3;
} myStruct;
```

Name an Externally Defined C Structure Type

Specify that a structure passed to a C function has a structure type defined in a C header file.

Create a C header file mycadd.h for the function mycadd that takes a parameter of type mycstruct. Define the type mycstruct in the header file.

```c
#ifndef MYCADD_H
#define MYCADD_H

typedef struct {
   double f1;
   double f2;
} mycstruct;

double mycadd(mycstruct *s);
#endif
```

Write the C function mycadd.c.
#include <stdio.h>
#include <stdlib.h>
#include "mycadd.h"

double mycadd(mycstruct *s)
{
    return s->f1 + s->f2;
}

Write a MATLAB function mymAdd that passes a structure by reference to mycadd. Use coder.cstructname to specify that in the generated code, the structure has the C type mycstruct, which is defined in mycadd.h.

function y = mymAdd
%#codegen
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'mycstruct', 'extern', 'HeaderFile', 'mycadd.h');
y = 0;
y = coder.ceval('mycadd', coder.ref(s));

Generate a C static library for function mymAdd.

codegen -config:lib mymAdd mycadd.c

The generated header file mymadd_types.h does not contain a definition of the structure mycstruct because mycstruct is an external type.

**Create a Structure Type Object That Names the Generated C Structure Type**

Suppose that the entry-point function myFunction takes a structure argument. To specify the type of the input argument at the command line:

1. Define an example structure S.
2. Create a type T from S by using coder.typeof.
3. Use coder.cstructname to create a type T1 that:
   - Has the properties of T.
   - Names the generated C structure type myStruct.
4. Pass the type to codegen by using the -args option.
For example:

```matlab
S = struct('a',double(0),'b',single(0));
T = coder.typeof(S);
T1 = coder.cstructname(T,'myStruct');
codegen -config:lib myFunction -args T1
```

Alternatively, you can create the structure type directly from the example structure.

```matlab
S = struct('a',double(0),'b',single(0));
T1 = coder.cstructname(S,'myStruct');
codegen -config:lib myFunction -args T1
```

### Input Arguments

- **var** — MATLAB structure or cell array variable
  
  structure | cell array

  MATLAB structure or cell array variable that is represented as a structure in the generated code.

- **structName** — Name of C structure type
  
  character vector | string scalar

  Name of generated or externally defined C structure type, specified as a character vector or string scalar.

- **headerfile** — Header file that contains the C structure type definition
  
  character vector | string scalar

  Header file that contains the C structure type definition, specified as a character vector or string scalar.

To specify the path to the file:

- Use the `codegen -I` option or the **Additional include directories** parameter on the MATLAB Coder app settings **Custom Code** tab.
- For a MATLAB Function block, on the **Simulation Target** and the **Code Generation** > **Custom Code** panes, under **Additional build information**, set the **Include directories** parameter.

Alternatively, use `coder.updateBuildInfo` with the 'addIncludePaths' option.
Example: 'mystruct.h'

**alignment** — Run-time memory alignment for structure
-1 (default) | power of 2 not greater than 128

Run-time memory alignment for generated or externally defined structure.

**intype** — Type object or variable for creation of new type object
coder StructType | coder CellType | structure | cell array

Structure type object, cell array type object, structure variable, or cell array variable from which to create a type object.

**Limitations**

- You cannot apply `coder.cstructname` directly to a global variable. To name the structure type to use with a global variable, use `coder.cstructname` to create a type object that names the structure type. Then, when you run `codegen`, specify that the global variable has that type. See “Name the C Structure Type to Use With a Global Structure Variable” (MATLAB Coder).
- For cell array inputs, the field names of externally defined structures must be `f1`, `f2`, and so on.

**Tips**

- For information about how the code generator determines the C/C++ types of structure fields, see “Mapping MATLAB Types to Types in Generated Code” (MATLAB Coder).
- Using `coder.cstructname` on a structure array sets the name of the structure type of the base element, not the name of the array. Therefore, you cannot apply `coder.cstructname` to a structure array element, and then apply it to the array with a different C structure type name. For example, the following code is not allowed. The second `coder.cstructname` attempts to set the name of the base type to `myStructArrayName`, which conflicts with the previously specified name, `myStructName`.

```matlab
% Define scalar structure with field a
myStruct = struct('a', 0);
```
coder.cstructname(myStruct,'myStructName');
% Define array of structure with field a
myStructArray = repmat(myStruct,4,6);
coder.cstructname(myStructArray,'myStructArrayName');

- Applying `coder.cstructname` to an element of a structure array produces the same result as applying `coder.cstructname` to the entire structure array. If you apply `coder.cstructname` to an element of a structure array, you must refer to the element by using a single subscript. For example, you can use `var(1)`, but not `var(1,1)`. Applying `coder.cstructname` to `var(:)` produces the same result as applying `coder.cstructname` to `var` or `var(n)`. 

- Heterogeneous cell arrays are represented as structures in the generated code. Here are considerations for using `coder.cstructname` with cell arrays:
  - In a function from which you generate code, using `coder.cstructname` with a cell array variable makes the cell array heterogeneous. Therefore, if a cell array is an entry-point function input and its type is permanently homogeneous, then you cannot use `coder.cstructname` with the cell array.
  - Using `coder.cstructname` with a homogeneous `coder.CellType` object `intype` makes the returned object heterogeneous. Therefore, you cannot use `coder.cstructname` with a permanently homogeneous `coder.CellType` object. For information about when a cell array is permanently homogeneous, see “Specify Cell Array Inputs at the Command Line” (MATLAB Coder).
  - When used with a `coder.CellType` object, `coder.cstructname` creates a `coder.CellType` object that is permanently heterogeneous.
  - When you use a structure named by `coder.cstructname` in a project with row-major and column-major array layouts, the code generator renames the structure in certain cases, appending `row_` or `col_` to the beginning of the structure name. This renaming provides unique type definitions for the types that are used in both array layouts.
  - These tips apply only to MATLAB Function blocks:
    - MATLAB Function block input and output structures are associated with bus signals. The generated name for the structure type comes from the bus signal name. Do not use `coder.cstructname` to name the structure type for input or output signals. See “Create Structures in MATLAB Function Blocks”.
    - The code generator produces structure type names according to identifier naming rules, even if you name the structure type with `coder.cstructname`. If you have Embedded Coder, you can customize the naming rules. See “Construction of Generated Identifiers” (Embedded Coder).

Topics
“Structure Definition for Code Generation”
“Code Generation for Cell Arrays”
“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a
**coder.extrinsic**

Declare extrinsic functions

**Syntax**

```matlab
coder.extrinsic(function)
coder.extrinsic(function1, ... ,functionN)
coder('-sync:on', function1, ... ,functionN)
coder('-sync:off', function1, ... ,functionN)
```

**Description**

`coder.extrinsic(function)` declares `function` as an extrinsic function. The code generator does not produce code for the body of the extrinsic function and instead uses the MATLAB engine to execute the call. This functionality is available only when the MATLAB engine is available in MEX functions, Simulink simulations, or during calls at compile time.

During standalone code generation, the code generator attempts to determine whether an extrinsic function affects the output of the function in which it is called — for example by returning `mxArrays` to an output variable. Provided that there is no change to the output, the code generator proceeds with code generation, but excludes the extrinsic function from the generated code. Otherwise, the code generator produces a compilation error.

You cannot use `coder.ceval` on functions that you declare as extrinsic by using `coder.extrinsic`.

`coder.extrinsic` is ignored outside of code generation.

`coder.extrinsic(function1, ... ,functionN)` declares `function1` through `functionN` as extrinsic functions.

`coder('-sync:on', function1, ... ,functionN)` enables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions `function1` through `functionN`. If only a few extrinsic calls use or modify
global data, turn off synchronization before and after all extrinsic function calls by setting the global synchronization mode to `At MEX-function entry and exit`. Use the `'-sync:on'` option to turn on synchronization for only the extrinsic calls that do modify global data.

See “Generate Code for Global Data” (MATLAB Coder).

```matlab
coder('-sync:off', function1, ... ,functionN)
```
disables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions `function1` through `functionN`. If most extrinsic calls use or modify global data, but a few do not, use the `'-sync:off'` option to turn off synchronization for the extrinsic calls that do not modify global data.

See “Generate Code for Global Data” (MATLAB Coder).

## Examples

### Declare a MATLAB Function as Extrinsic

The MATLAB function `patch` is not supported for code generation. This example shows how you can still use the functionality of `patch` in your generated MEX function by declaring `patch` as extrinsic your MATLAB function.

This MATLAB code declares `patch` as extrinsic in the local function `create_plot`. By declaring `patch` as extrinsic, you instruct the code generator not to produce code for `patch`. Instead, the code generator dispatches `patch` to MATLAB for execution.

The code generator automatically treats many common MATLAB visualization functions, such as the function `axis` as extrinsic.

```matlab
function c = pythagoras(a,b,color) %#codegen
% Calculate the hypotenuse of a right triangle
% and display the triangle as a patch object.
c = sqrt(a^2 + b^2);
create_plot(a, b, color);
end

function create_plot(a, b, color)
%Declare patch as extrinsic
coder.extrinsic('patch');
```
\begin{verbatim}
x = [0;a;a];
y = [0;0;b];
patch(x,y,color);
axis('equal');
end
\end{verbatim}

Generate a MEX function for \textit{pythagoras}. Also, generate the code generation report.

codegen -report pythagoras -args {1, 1, [.3 .3 .3]}

In the report, view the MATLAB code for \textit{create_plot}.

\begin{verbatim}
function create_plot(a, b, color)
coder.extrinsic('patch');
x = [0;a;a];
y = [0;0;b];
patch(x,y,color);
axis('equal');
end
\end{verbatim}

The report highlights the \textit{patch} and \textit{axis} functions to indicate that they are treated as extrinsic functions.

Run the MEX function.

\texttt{pythagoras_mex(3, 4, [1.0 0.0 0.0]);}

MATLAB displays the plot of the right triangle as a red patch object.
Input Arguments

function — MATLAB function name
character vector

Name of the MATLAB function that is declared as extrinsic.

Example: coder.extrinsic('patch')

Data Types: char
Limitations

- Extrinsic function calls have some overhead that can affect performance. Input data that is passed in an extrinsic function call must be provided to MATLAB, which requires making a copy of the data. If the function has any output data, this data must be transferred back into the MEX function environment, which also requires a copy.
- The code generator does not support the use of `coder.extrinsic` to call functions that are located in a private folder.
- The code generator does not support the use of `coder.extrinsic` to call local functions.

Tips

- The code generator automatically treats many common MATLAB visualization functions, such as `plot`, `disp`, and `figure`, as extrinsic. You do not have to explicitly declare them as extrinsic functions by using `coder.extrinsic`.
- Use the `coder.screener` function to detect which functions you must declare as extrinsic. This function runs the Code Generation Readiness Tool that screens the MATLAB code for features and functions that are not supported for code generation.

“Resolution of Function Calls for Code Generation”

Introduced in R2011a
coder.ignoreConst

Prevent use of constant value of expression for function specializations

Syntax

coder.ignoreConst(expression)

Description

coder.ignoreConst(expression) prevents the code generator from using the constant value of expression to create function specializations on page 2-113. coder.ignoreConst(expression) returns the value of expression.

Examples

Prevent Function Specializations Based on Constant Input Values

Use coder.ignoreConst to prevent function specializations for a function that is called with constant values.

Write the function call_myfn, which calls myfcn.

```matlab
function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, 'mode1');
y = myfcn(n, 'mode2');
end

function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode,'mode1')
    y = n;
else
    y = -n;
end
```
Generate standalone C code. For example, generate a static library. Enable the code generation report.

codegen -config:lib call_myfcn -args {1} -report

In the code generation report, you see two function specializations for call_myfcn.

The code generator creates call_myfcn>myfcn>1 for mode with a value of 'mode1'. It creates call_myfcn>myfcn>2 for mode with a value of 'mode2'.

In the generated C code, you see the specializations my_fcn and b_my_fcn.

static double b_myfcn(double n)
{
    return -n;
}

static double myfcn(double n)
{
    return n;
}

To prevent the function specializations, instruct the code generator to ignore that values of the mode argument are constant.

function [x, y] = call_myfcn(n)
%#codegen
x = myfcn(n, coder.ignoreConst('mode1'));
y = myfcn(n, coder.ignoreConst('mode2'));
end

function y = myfcn(n,mode)
coder.inline('never');
if strcmp(mode, 'mode1')
y = n;
else
  y = -n;
end
end

Generate the C code.

codegen -config:lib call_myfcn -args {1} -report

In the code generation report, you do not see multiple function specializations.

In the generated C code, you see one function for my_fcn.

**Input Arguments**

expression — Expression whose value is to be treated as a nonconstant

MATLAB expression

**More About**

**Function Specialization**

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.
**Tips**

- For some recursive function calls, you can use `coder.ignoreConst` to force run-time recursion. See “Force Code Generator to Use Run-Time Recursion”.
- `coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations. It does not prevent other uses of the constant value during code generation.

**See Also**
coder.ignoreSize | coder.inline

**Topics**
“Force Code Generator to Use Run-Time Recursion”
“Compile-Time Recursion Limit Reached”
“Avoid Duplicate Functions in Generated Code”

**Introduced in R2017a**
**coder.ignoreSize**

**Package:** coder

Prevent code generator from creating function specializations for constant-size expressions

**Syntax**

coder.ignoreSize(expression)

**Description**

coder.ignoreSize(expression) declares that the code generator must not use the constant size of an expression to create function specializations.

**Examples**

**Duplicate Functions Generated for Multiple Input Sizes**

If your MATLAB code calls a function multiple times and passes inputs of different sizes, the code generator can create function specializations for each size. To avoid this issue, use coder.ignoreSize on the function input. For example, this code uses coder.ignoreSize to avoid creating multiple copies of the function indexOf:

```matlab
function [out1, out2] = test1(in)
    a = 1:10;
    b = 2:40;
    % Without coder.ignoreSize duplicate functions are generated
    out1 = indexOf(coder.ignoreSize(a), in);
    out2 = indexOf(coder.ignoreSize(b), in);
end
```

```matlab
function index = indexOf(array, value)
    coder.inline('never');
    for i = 1:numel(array)
    end
```
if array(i) == value
    index = i;
    return
end
end
index = -1;
return
end

To generate code, enter:

codegen test1 -config:lib -report -args {1}

**Input Arguments**

expression — Expression whose size is to be treated as nonconstant MATLAB expression

Example: foo(coder.ignoreSize(1:10))

**More About**

**Function Specialization**

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

**Tips**

- If you assign an expression to a variable and declare the variable as variable-size by using coder.varsize, this declaration has the same effect as using coder.ignoreSize on the expression.

“Avoid Duplicate Functions in Generated Code”

Introduced in R2019b
**coder.inline**

**Package:** coder

Control inlining in generated code

**Syntax**

coder.inline('always')
coder.inline('never')
coder.inline('default')

**Description**

coder.inline('always') forces inlining on page 2-119 of the current function in the generated code. Place the `coder.inline` directive inside the function to which it applies. The code generator does not inline entry-point functions, inline functions into `parfor` loops, or inline functions called from `parfor` loops.

coder.inline('never') prevents inlining of the current function in the generated code. Prevent inlining when you want to simplify the mapping between the MATLAB source code and the generated code.

coder.inline('default') uses internal heuristics to determine whether to inline the current function. Usually, the heuristics produce highly optimized code. Use `coder.inline` only when you need to fine-tune these optimizations.

**Examples**

- “Prevent Function Inlining” on page 2-118
- “Use coder.inline in Control Flow Statements” on page 2-119

**Prevent Function Inlining**

In this example, function `foo` is not inlined in the generated code:
function y = foo(x)
    coder.inline('never');
    y = x;
end

Use coder.inline in Control Flow Statements

You can use coder.inline in control flow code. If the software detects contradictory coder.inline directives, the generated code uses the default inlining heuristic and issues a warning.

Suppose that you want to generate code for a division function used by a system with limited memory. To optimize memory use in the generated code, the inline_division function manually controls inlining based on whether it performs scalar division or vector division:

function y = inline_division(dividend, divisor)

% For scalar division, inlining produces smaller code
% than the function call itself.
if iscalar(dividend) && iscalar(divisor)
    coder.inline('always');
else
    % Vector division produces a for-loop.
    % Prohibit inlining to reduce code size.
    coder.inline('never');
end

if any(divisor == 0)
    error('Cannot divide by 0');
end

y = dividend / divisor;

More About

Inlining

Technique that replaces a function call with the contents (body) of that function. Inlining eliminates the overhead of a function call, but can produce larger C/C++ code. Inlining can create opportunities for further optimization of the generated C/C++ code.

Introduced in R2011a
coder.isColumnMajor

Determine whether the current function or variable uses column-major layout

Syntax

coder.isColumnMajor
coder.isColumnMajor(arg)

Description

coder.isColumnMajor resolves as true in the generated code if the current function uses column-major array layout. Use the function as the expression in control flow (if, else, switch) statements.

coder.isColumnMajor(arg) resolves as true if the current variable uses column-major array layout.

Examples

Query Array Layout of a Function

To query the array layout of a function at compile time, use coder.isColumnMajor or coder.isRowMajor. This query can be useful for specializing your generated code when it involves row-major and column-major functions. For example, consider this function:

```
function S = addMatrixRouted(A,B)
  if coder.isRowMajor
    %execute this code if row major
    S = addMatrix_OptimizedForRowMajor(A,B);
  elseif coder.isColumnMajor
    %execute this code if column major
    S = addMatrix_OptimizedForColumnMajor(A,B);
  end
```
The function `addMatrixRouted` behaves differently depending on whether it uses row-major layout or column-major layout. The layout that the function uses, for example, can depend on whether it is called from a function that contains `coder.rowMajor` or `coder.columnMajor`. When `addMatrixRouted` uses row-major layout, it calls the `addMatrix_OptimizedForRowMajor` function, which has efficient memory access for row-major data. When the function uses column-major layout, it calls a version of the `addMatrix` function optimized for column-major data.

By using the query functions, the generated code for `addMatrixRouted` provides efficient memory access for either choice of array layout.

**Query Array Layout of a Variable**

Consider the function `bar`:

```matlab
function bar
coder.columnMajor;
x = magic(3);
if coder.isColumnMajor(x)
    fprintf('This will always be displayed in generated code.
    
else
    fprintf('This will never be displayed in generated code.
    
end
```

Generate code:

```bash
codegen bar
```

To run the MEX function, enter:

```bash
bar_mex
```

**Input Arguments**

`arg` — Variable name
array variable

Variable to query for array layout.

Example: `coder.isColumnMajor(x);`
Limitations

- You cannot query the array layout of a structure field or property.

Tips

- The code generator uses column-major layout by default.
- Outside of code generation and simulation, `coder.isColumnMajor` is always true.
- If `coder.isColumnMajor` always resolves to true for your code, other branches in the if statement are ignored by the code generator. Otherwise, one instance of the current function is created for each array layout.

**coder.isRowMajor**

Determine whether the current function or variable uses row-major layout

**Syntax**

coder.isRowMajor
coder.isRowMajor(arg)

**Description**

coder.isRowMajor resolves as true in the generated code if the current function uses row-major array layout. Use the function as the expression in control flow (if, else, switch) statements.

coder.isRowMajor(arg) resolves as true if the current variable uses row-major array layout.

**Examples**

**Query Array Layout of a Function**

To query the array layout of a function at compile time, use `coder.isRowMajor` or `coder.isColumnMajor`. This query can be useful for specializing your generated code when it involves row-major and column-major functions. For example, consider this function:

```matlab
function S = addMatrixRouted(A,B)
    if coder.isRowMajor
        %execute this code if row major
        S = addMatrix_OptimizedForRowMajor(A,B);
    elseif coder.isColumnMajor
        %execute this code if column major
        S = addMatrix_OptimizedForColumnMajor(A,B);
    end
```
The function `addMatrixRouted` behaves differently depending on whether it uses row-major layout or column-major layout. The layout that the function uses, for example, can depend on whether it is called from a function that contains `coder.rowMajor` or `coder.columnMajor`. When `addMatrixRouted` uses row-major layout, it calls the `addMatrix_OptimizedForRowMajor` function, which has efficient memory access for row-major data. When the function uses column-major layout, it calls a version of the `addMatrix` function optimized for column-major data.

By using the query functions, the generated code for `addMatrixRouted` provides efficient memory access for either choice of array layout.

**Query Array Layout of a Variable**

Consider the function `foo`:

```matlab
function foo
coder.rowMajor;
x = magic(3);
if coder.isRowMajor(x)
    fprintf('This will always be displayed in generated code.
');
else
    fprintf('This will never be displayed in generated code.
');
end
end
```

Generate code:

```
codegen foo
```

To run the MEX function, enter:

```
foo_mex
```

**Input Arguments**

`arg` — Variable name

Array variable

Variable to query for array layout.

Example: `coder.isRowMajor(x);`
Limitations

- You cannot query the array layout of a structure field or property.

Tips

- Outside of code generation and simulation, `coder.isRowMajor` is always false.
- If `coder.isRowMajor` always resolves to true for your code, other branches in the if statement are ignored by the code generator. Otherwise, one instance of the current function is created for each array layout.

**coder.load**

Load compile-time constants from MAT-file or ASCII file into caller workspace

**Syntax**

```matlab
S = coder.load(filename)
S = coder.load(filename,var1,...,varN)
S = coder.load(filename,'-regexp',expr1,...,exprN)
S = coder.load(filename,'-ascii')
S = coder.load(filename,'-mat')
S = coder.load(filename,'-mat','-regexp', expr1,...,exprN)
```

**Description**

*S* = `coder.load(filename)` loads compile-time constants from `filename`.

- If `filename` is a MAT-file, then `coder.load` loads variables from the MAT-file into a structure array.
- If `filename` is an ASCII file, then `coder.load` loads data into a double-precision array.

`coder.load` loads data at code generation time, also referred to as *compile time*. If you change the content of `filename` after you generate code, the change is not reflected in the behavior of the generated code.

*S* = `coder.load(filename,var1,...,varN)` loads only the specified variables from the MAT-file `filename`.

*S* = `coder.load(filename,'-regexp',expr1,...,exprN)` loads only the variables that match the specified regular expressions.

*S* = `coder.load(filename,'-ascii')` treats `filename` as an ASCII file, regardless of the file extension.
\[ S = \text{coder.load}(\text{filename}, \text{'-mat'}) \] treats \text{filename} as a MAT-file, regardless of the file extension.

\[ S = \text{coder.load}(\text{filename}, \text{'-mat'}, \text{var1}, \ldots, \text{varN}) \] treats \text{filename} as a MAT-file and loads only the specified variables from the file.

\[ S = \text{coder.load}(\text{filename}, \text{'-mat'}, \text{'-regexp'}, \text{expr1}, \ldots, \text{exprN}) \] treats \text{filename} as a MAT-file and loads only the variables that match the specified regular expressions.

**Examples**

**Load compile-time constants from MAT-file**

Generate code for a function \texttt{edgeDetect1} which given a normalized image, returns an image where the edges are detected with respect to the threshold value. \texttt{edgeDetect1} uses \texttt{coder.load} to load the edge detection kernel from a MAT-file at compile time.

Save the Sobel edge-detection kernel in a MAT-file.

\[ k = \begin{bmatrix} 1 & 2 & 1; 0 & 0 & 0; -1 & -2 & -1 \end{bmatrix}; \]

\[ \text{save sobel.mat } k \]

Write the function \texttt{edgeDetect1}.

\begin{verbatim}
function edgeImage = edgeDetect1(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

S = coder.load('sobel.mat','k');
H = conv2(double(originalImage),S.k, 'same');
V = conv2(double(originalImage),S.k','same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
\end{verbatim}

Create a code generation configuration object for a static library.

\[ \text{cfg = coder.config('lib')}; \]

Generate a static library for \texttt{edgeDetect1}. 

2-128
codegen -report -config cfg edgeDetect1

codegen generates C code in the codegen\lib\edgeDetect1 folder.

**Load compile-time constants from ASCII file**

Generate code for a function `edgeDetect2` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect2` uses `coder.load` to load the edge detection kernel from an ASCII file at compile time.

Save the Sobel edge-detection kernel in an ASCII file.

k = [1 2 1; 0 0 0; -1 -2 -1];
save sobel.dat k -ascii

Write the function `edgeDetect2`.

```matlab
function edgeImage = edgeDetect2(originalImage, threshold) %#codegen
    assert(all(size(originalImage) <= [1024 1024]));
    assert(isa(originalImage, 'double'));
    assert(isa(threshold, 'double'));

    k = coder.load('sobel.dat');
    H = conv2(double(originalImage),k, 'same');
    V = conv2(double(originalImage),k,'same');
    E = sqrt(H.*H + V.*V);
    edgeImage = uint8((E > threshold) * 255);

Create a code generation configuration object for a static library.

cfg = coder.config('lib');

Generate a static library for `edgeDetect2`.

codegen -report -config cfg edgeDetect2
```
codegen generates C code in the `codegen\lib\edgeDetect2` folder.

**Input Arguments**

`filename` — Name of file  
character vector | string scalar

Name of file. `filename` must be a compile-time constant.

`filename` can include a file extension and a full or partial path. If `filename` has no extension, `load` looks for a file named `filename.mat`. If `filename` has an extension other than `.mat`, `load` treats the file as ASCII data.

ASCII files must contain a rectangular table of numbers, with an equal number of elements in each row. The file delimiter (the character between elements in each row) can be a blank, comma, semicolon, or tab character. The file can contain MATLAB comments (lines that begin with a percent sign, %).

Example: `'myFile.mat'`

`var1,...,varN` — Names of variables to load  
character vector | string scalar

Names of variables, specified as one or more character vectors or string scalars. Each variable name must be a compile-time constant. Use the `*` wildcard to match patterns.

Example: `coder.load('myFile.mat','A*')` loads all variables in the file whose names start with `A`.

`expr1,...,exprN` — Regular expressions indicating which variables to load  
character vector | string scalar

Regular expressions indicating which variables to load specified as one or more character vectors or string scalars. Each regular expression must be a compile-time constant.

Example: `coder.load('myFile.mat', '-regexp', '^A')` loads only variables whose names begin with `A`. 
Output Arguments

S — Loaded variables or data
structure array | m-by-n array

If filename is a MAT-file, S is a structure array.

If filename is an ASCII file, S is an m-by-n array of type double. m is the number of lines in the file and n is the number of values on a line.

Limitations

• Arguments to coder.load must be compile-time constants.
• The output S must be the name of a structure or array without any subscripting. For example, S(i) = coder.load('myFile.mat') is not allowed.
• You cannot use save to save workspace data to a file inside a function intended for code generation. The code generator does not support the save function. Furthermore, you cannot use coder.extrinsic with save. Prior to generating code, you can use save to save workspace data to a file.

Tips

• coder.load loads data at compile time, not at run time. If you are generating MEX code or code for Simulink simulation, you can use the MATLAB function load to load run-time values.
• If the MAT-file contains unsupported constructs, use coder.load(filename, var1, ..., varN) to load only the supported constructs.
• If you generate code in a MATLAB Coder project, the code generator practices incremental code generation for the coder.load function. When the MAT-file or ASCII file used by coder.load changes, the software rebuilds the code.

matfile | regexp | save
Topics
“Regular Expressions” (MATLAB)

Introduced in R2013a
coder.nullcopy

Package: coder

Declare uninitialized variables in code generation

Syntax

X = coder.nullcopy(A)

Description

X = coder.nullcopy(A) copies type, size, and complexity of A to X, but does not copy element values. The function preallocates memory for X without incurring the overhead of initializing memory. In code generation, the coder.nullcopy function declares uninitialized variables. In MATLAB, coder.nullcopy returns the input such that X is equal to A.

If X is a structure containing variable-sized arrays, then you must assign the size of each array. coder.nullcopy does not copy sizes of arrays or nested arrays from its argument to its result.

Note Before you use X in a function or a program, ensure that the data in X is completely initialized. Declaring a variable through coder.nullcopy without assigning all the elements of the variable results in nondeterministic program behavior. For more information, see “How to Eliminate Redundant Copies by Defining Uninitialized Variables”.

Examples

Declare Variables for Optimized Initialization

Declare variable X as a 1-by-5 vector of real doubles without performing an unnecessary initialization:
function X = foo %#codegen

N = 5;
X = coder.nullcopy(zeros(1,N));
for i = 1:N
    if mod(i,2) == 0
        X(i) = i;
    else
        X(i) = 0;
    end
end

Using coder.nullcopy with zeros lets you specify the size of vector X without initializing each element to zero.

Input Arguments

A — Variable to copy
scalar | vector | matrix | multidimensional array

Variable to copy, specified as a scalar, vector, matrix, or multidimensional array.

Example: coder.nullcopy(A);

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string
Complex Number Support: Yes

Limitations

You cannot use coder.nullcopy on sparse matrices, structures, cell arrays, or classes that contain sparse matrices.

Topics
“Eliminate Redundant Copies of Variables in Generated Code”
Introduced in R2011a
**coder.opaque**

Declare variable in generated code

**Syntax**

\[
y = \text{coder.opaque}(	ext{type})
\]
\[
y = \text{coder.opaque}(	ext{type}, \text{value})
\]
\[
y = \text{coder.opaque}(\_\_, \text{'Size'}, \text{Size})
\]
\[
y = \text{coder.opaque}(\_\_, \text{'HeaderFile'}, \text{HeaderFile})
\]

**Description**

\[
y = \text{coder.opaque}(	ext{type})
\] declares a variable \( y \) with the specified type and no initial value in the generated code.

- \( y \) can be a variable or a structure field.
- MATLAB code cannot set or access \( y \), but external C functions can accept \( y \) as an argument.
- \( y \) can be an:
  - Argument to \text{coder.rref}, \text{coder.wref}, or \text{coder.ref}
  - Input or output argument to \text{coder.ceval}
  - Input or output argument to a user-written MATLAB function
  - Input to a subset of MATLAB toolbox functions supported for code generation
- Assignment from \( y \) declares another variable with the same type in the generated code. For example:

\[
y = \text{coder.opaque}('\text{int}')
\]
\[
z = y;
\]

declares a variable \( z \) of type \text{int} in the generated code.

- You can assign \( y \) from another variable declared using either \text{coder.opaque} or assignment from a variable declared using \text{coder.opaque}. The variables must have identical types.
• You can compare `y` to another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

\[
y = \text{coder.opaque}(\text{type},\text{value})\text{ specifies the type and initial value of } y.\]

\[
y = \text{coder.opaque}(\_\_\_,'\text{Size}',\text{Size})\text{ specifies the size, in bytes, of } y. \text{ You can specify the size with any of the previous syntaxes.}\]

\[
y = \text{coder.opaque}(\_\_\_,'\text{HeaderFile}',\text{HeaderFile})\text{ specifies the header file that contains the type definition. The code generator produces the } \#\text{include statement for the header file where the statement is required in the generated code. You can specify the header file with any of the previous syntaxes.}\]

### Examples

#### Declare Variable Specifying Initial Value

Generate code for a function `valtest` which returns 1 if the call to `myfun` is successful. This function uses `coder.opaque` to declare a variable `x1` with type `int` and initial value 0. The assignment `x2 = x1` declares `x2` to be a variable with the type and initial value of `x1`.

Write a function `valtest`.

```matlab
function y = valtest  
%codegen  
%declare x1 to be an integer with initial value '0'
x1 = coder.opaque('int','0');  
%Declare x2 to have same type and initial value as x1  
x2 = x1;  
x2 = coder.ceval('myfun');  
%test the result of call to 'myfun' by comparing to value of x1  
if x2 == x1  
    y = 0;  
else  
    y = 1;  
end
```
Declare Variable Specifying Initial Value and Header File

Generate code for a MATLAB function filetest which returns its own source code using fopen/fread/fclose. This function uses coder.opaque to declare the variable that stores the file pointer used by fopen/fread/fclose. The call to coder.opaque declares the variable f with type FILE *, initial value NULL, and header file <stdio.h>.

Write a MATLAB function filetest.

```matlab
function buffer = filetest
%#codegen
% Declare 'f' as an opaque type 'FILE *' with initial value 'NULL'
% Specify the header file that contains the type definition of 'FILE *';

f = coder.opaque('FILE *', 'NULL','HeaderFile','<stdio.h>');
% Open file in binary mode
f = coder.ceval('fopen', cstring('filetest.m'), cstring('rb'));
% Read from file until end of file is reached and put
% contents into buffer
n = int32(1);
i = int32(1);
buffer = char(zeros(1,8192));
while n > 0
    % By default, MATLAB converts constant values
    % to doubles in generated code
    % so explicit type conversion to int32 is inserted.
    n = coder.ceval('fread', coder.ref(buffer(i)), int32(1), ...
                    int32(numel(buffer)), f);
    i = i + n;
end
coder.ceval('fclose',f);

buffer = strip_cr(buffer);

% Put a C termination character '\0' at the end of MATLAB character vector
function y = cstring(x)
    y = [x char(0)];

% Remove all character 13 (CR) but keep character 10 (LF)
function buffer = strip_cr(buffer)
    j = 1;
    for i = 1:numel(buffer)
        if buffer(i) == char(13)
            buffer(j) = buffer(i);
            j = j + 1;
        end
    end
```

2-138
Compare Variables Declared Using coder.opaque

Compare variables declared using coder.opaque to test for successfully opening a file.

Use coder.opaque to declare a variable null with type FILE * and initial value NULL.

```
null = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
```

Use assignment to declare another variable fttmp with the same type and value as null.

```
ftmp = null;
ftmp = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

Compare the variables.

```
if ftmp == null
    %error condition
end
```

Cast to and from Types of Variables Declared Using coder.opaque

This example shows how to cast to and from types of variables that are declared using coder.opaque. The function castopaque calls the C run-time function strncmp to compare at most n characters of the strings s1 and s2. n is the number of characters in the shorter of the strings. To generate the correct C type for the strncmp input nsizet, the function casts n to the C type size_t and assigns the result to nsizet. The function uses coder.opaque to declare nsizet. Before using the output retval from strncmp, the function casts retval to the MATLAB type int32 and stores the results in y.

Write this MATLAB function:

```
function y = castopaque(s1,s2)

%  <0 - the first character that does not match has a lower value in s1 than in s2
%  0 - the contents of both strings are equal
%  >0 - the first character that does not match has a greater value in s1 than in s2
%  
%#codegen
```
coder.cinclude('<string.h>);
n = min(numel(s1), numel(s2));

% Convert the number of characters to compare to a size_t
nsizet = cast(n,'like',coder.opaque('size_t','0'));

% The return value is an int
retval = coder.opaque('int');
retval = coder.ceval('strncmp', cstr(s1), cstr(s2), nsizet);

% Convert the opaque return value to a MATLAB value
y = cast(retval, 'int32');

%-----------------
function sc = cstr(s)
% NULL terminate a MATLAB character vector for C
sc = [s, char(0)];

Generate the MEX function.
codegen castopaque -args {blanks(3), blanks(3)} -report

Call the MEX function with inputs 'abc' and 'abc'.
castopaque_mex('abc','abc')
ans =

    0

The output is 0 because the strings are equal.

Call the MEX function with inputs 'abc' and 'abd'.
castopaque_mex('abc','abd')
ans =

    -1

The output is -1 because the third character d in the second string is greater than the third character c in the first string.

Call the MEX function with inputs 'abd' and 'abc'.

2-140
castopaque_mex('abd','abc')
ans =
 1

The output is 1 because the third character d in the first string is greater than the third character c in the second string.

In the MATLAB workspace, you can see that the type of y is int32.

**Declare Variable Specifying Initial Value and Size**

Declare y to be a 4-byte integer with initial value 0.

```matlab
y = coder.opaque('int','0', 'Size', 4);
```

**Input Arguments**

- **type** — Type of variable
  character vector | string scalar

Type of variable in generated code. type must be a compile-time constant. The type must be a:

- Built-in C data type or a type defined in a header file
- C type that supports copy by assignment
- Legal prefix in a C declaration

Example: 'FILE *'

- **value** — Initial value of variable
  character vector | string scalar

Initial value of variable in generated code. value must be a compile-time constant. Specify a C expression not dependent on MATLAB variables or functions.

If you do not provide the initial value in value, initialize the value of the variable before using it. To initialize a variable declared using coder.opaque:
• Assign a value from another variable with the same type declared using either \texttt{coder.opaque} or assignment from a variable declared using \texttt{coder.opaque}.

• Assign a value from an external C function.

• Pass the address of the variable to an external function using \texttt{coder.wref}.

Specify a value that has the type that \texttt{type} specifies. Otherwise, the generated code can produce unexpected results.

Example: \texttt{'NULL'}

\textbf{Size — Size of variable}

\texttt{integer}

Number of bytes for the variable in the generated code, specified as an integer. If you do not specify the size, the size of the variable is 8 bytes.

Data Types: \texttt{single} | \texttt{double} | \texttt{int8} | \texttt{int16} | \texttt{int32} | \texttt{int64} | \texttt{uint8} | \texttt{uint16} | \texttt{uint32} | \texttt{uint64}

\textbf{HeaderFile — Name of header file}

\texttt{character vector} | \texttt{string scalar}

Name of header file that contains the definition of \texttt{type}. \texttt{HeaderFile} must be a compile-time constant.

For a system header file, use angle brackets.

Example: \texttt{'<stdio.h>}' generates \texttt{#include <stdio.h>}

For an application header file, use double quotes.

Example: \texttt{"foo.h"} generates \texttt{#include "foo.h"}

If you omit the angle brackets or double quotes, the code generator produces double quotes.

Example: \texttt{'foo.h'} generates \texttt{#include "foo.h"}

Specify the include path in the build configuration parameters.

Example: \texttt{cfg.CustomInclude = 'c:\myincludes'}
Tips

- Specify a value that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results. For example, the following `coder.opaque` declaration can produce unexpected results.

```matlab
y = coder.opaque('int', '0.2')
```

- `coder.opaque` declares the type of a variable. It does not instantiate the variable. You can instantiate a variable by using it later in the MATLAB code. In the following example, assignment of `fp1` from `coder.ceval` instantiates `fp1`.

```matlab
% Declare fp1 of type FILE *
fpl = coder.opaque('FILE *');
%Create the variable fp1
fp1 = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

- In the MATLAB environment, `coder.opaque` returns the value specified in `value`. If `value` is not provided, it returns an empty character vector.

- You can compare variables declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types. The following example demonstrates how to compare these variables. “Compare Variables Declared Using coder.opaque” on page 2-139

- To avoid multiple inclusions of the same header file in generated code, enclose the header file in the conditional preprocessor statements `#ifndef` and `#endif`. For example:

```matlab
#ifndef MyHeader_h
#define MyHeader_h
<body of header file>
#endif
```

- You can use the MATLAB `cast` function to cast a variable to or from a variable that is declared using `coder.opaque`. Use `cast` with `coder.opaque` only for numeric types.

To cast a variable declared by `coder.opaque` to a MATLAB type, you can use the `B = cast(A, type)` syntax. For example:

```matlab
x = coder.opaque('size_t', '0');
x1 = cast(x, 'int32');
```

You can also use the `B = cast(A, 'like', p)` syntax. For example:
x = coder.opaque('size_t','0');
x1 = cast(x, 'like', int32(0));

To cast a MATLAB variable to the type of a variable declared by coder.opaque, you must use the B = cast(A,'like',p) syntax. For example:

x = int32(12);
x1 = coder.opaque('size_t', '0');
x2 = cast(x, 'like', x1));

Use cast with coder.opaque to generate the correct data types for:

- Inputs to C/C++ functions that you call using coder.ceval.
- Variables that you assign to outputs from C/C++ functions that you call using coder.ceval.

Without this casting, it is possible to receive compiler warnings during code generation.

**Topics**
“Integrate C Code Using the MATLAB Function Block”

**Introduced in R2011a**
**coder.ref**

Indicate data to pass by reference

**Syntax**

coder.ref(arg)

**Description**

coder.ref(arg) indicates that arg is an expression or variable to pass by reference to an external C/C++ function. Use coder.ref inside a coder.ceval call only. The C/C++ function can read from or write to the variable passed by reference. Use a separate coder.ref construct for each argument that you pass by reference to the function.

See also coder.rref and coder.wref.

**Examples**

**Pass Scalar Variable by Reference**

Consider the C function addone that returns the value of an input plus one:

```c
double addone(double* p) {
    return *p + 1;
}
```

The C function defines the input variable p as a pointer to a double.

Pass the input by reference to addone:

```c
...  
y = 0;
u = 42;
```
y = coder.ceval('addone', coder.ref(u));
...

Pass Multiple Arguments by Reference
...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.ref(u), coder.ref(v));
...

Pass Class Property by Reference
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.ref(x.prop));
...

Pass a Structure by Reference

To indicate that the structure type is defined in a C header file, use coder.cstructname.

Suppose that you have the C function incr_struct. This function reads from and writes to the input argument.

#include "MyStruct.h"

void incr_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = my_struct->f1 + 1;
    my_struct->f2 = my_struct->f2 + 1;
}

The C header file, MyStruct.h, defines a structure type named MyStruct:

#ifndef MYSTRUCT
#define MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{

double f1;
    double f2;
} MyStruct;

void incr_struct(struct MyStruct *my_struct);

In your MATLAB function, pass a structure by reference to incr_struct. To indicate that the structure type for s has the name MyStruct that is defined in the C header file MyStruct.h, use coder.cstructname.

function y = foo
    %#codegen
    y = 0;
    coder.updateBuildInfo('addSourceFiles','incr_struct.c');

    s = struct('f1',1,'f2',2);
    coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
    coder.ceval('incr_struct', coder.ref(s));

To generate standalone library code, enter:

codegen -config:lib foo -report

**Pass Structure Field by Reference**

... 
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.ref(s.s1.a));
...

You can also pass an element of an array of structures:

... 
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.ref(a.b(3,4).c(2).u));
...
Input Arguments

arg — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct
Complex Number Support: Yes

Limitations

• You cannot pass these data types by reference:
  • Class or System object
  • Cell array or index into a cell array
  • If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

• If arg is an array, then coder.ref(arg) provides the address of the first element of the array. The coder.ref(arg) function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

coder.ceval('myFun',coder.ref(arg),int32(numel(arg)));

• When you pass a structure by reference to an external C/C++ function, use coder.cstructname to provide the name of a C structure type that is defined in a C header file.

• In MATLAB, coder.ref results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use coder.target.

• You can use coder.opaque to declare variables that you pass to and from an external C/C++ function.

Topics

"Integrate C Code Using the MATLAB Function Block"

Introduced in R2011a
**coder.rowMajor**

Specify row-major array layout for a function or class

**Syntax**

coder.rowMajor

**Description**

coder.rowMajor specifies row-major array layout for the data used by the current function in generated code. When placed in a class constructor, coder.rowMajor specifies row-major layout for data used by the class.

**Examples**

**Specify Row-Major Array Layout for a Function**

Specify row-major array layout for a function by inserting coder.rowMajor into the function body.

Suppose that `myFunction` is the top-level function of your code. Your application requires you to perform matrix addition with row-major array layout and matrix multiplication with column-major layout.

```matlab
function S = myFunction(A,B)
%#codegen
% check to make sure inputs are valid
if size(A,1) ~= size(B,1) || size(A,2) ~= size(B,2)
    disp('Matrices must be same size.');
    return;
end
% make both matrices symmetric
B = B*B';
A = A*A';
```

2-150
% add matrices
S = addMatrix(A,B);
end

Write a function for matrix addition called addMatrix. Specify row-major layout for addMatrix by using coder.rowMajor.

function S = addMatrix(A,B)
%#codegen
S = zeros(size(A));
coder.rowMajor; % specify row-major array layout
S = A + B;
end

Generate code for myFunction. Use the codegen command.

codegen myFunction -args {ones(10,20),ones(10,20)} -config:lib -launchreport

The code generator produces code for addMatrix that uses row-major array layout. However, the matrix multiplication from the top-level function uses the default layout, column-major.

**Tips**

- To specify row-major array layout for all the functions in your generated code, use the codegen -rowmajor option.
- Other functions called from within a row-major function inherit the row-major specification. However, if one of the called functions has its own distinct coder.columnMajor call, the code generator changes the array layout accordingly. If a row-major function and a column-major function call the same function, which does not have its own array layout specification, the code generator produces a row-major version and column-major version of the function.
- coder.rowMajor is ignored outside of code generation and simulation.

Introduced in R2018a
**coder.rref**

Indicate read-only data to pass by reference

**Syntax**

coder.rref(arg)

**Description**

coder.rref(arg) indicates that arg is a read-only expression or variable to pass by reference to an external C/C++ function. Use coder.rref only inside a coder.ceval call.

The coder.rref function can enable the code generator to optimize the generated code. Because the external function is assumed to not write to coder.rref(arg), the code generator can perform optimizations such as expression folding on assignments to arg that occur before and after the coder.ceval call. Expression folding is the combining of multiple operations into one statement to avoid the use of temporary variables and improve code performance.

**Note** The code generator assumes that the memory that you pass with coder.rref(arg) is read-only. To avoid unpredictable results, the C/C++ function must not write to this variable.

See also coder.ref and coder.wref.

**Examples**

**Pass Scalar Variable as a Read-Only Reference**

Consider the C function addone that returns the value of a constant input plus one:
double addone(const double* p) {
    return *p + 1;
}

The C function defines the input variable p as a pointer to a constant double.

Pass the input by reference to addone:

...  
y = 0;
u = 42;
y = coder.ceval('addone', coder.rref(u));
...

**Pass Multiple Arguments as a Read-Only Reference**

...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.rref(u), coder.rref(v));
...

**Pass Class Property as a Read-Only Reference**

...
x = myClass;
x.prop = 1;
y = coder.ceval('foo', coder.rref(x.prop));
...

**Pass Structure as a Read-Only Reference**

To indicate that the structure type is defined in a C header file, use coder.cstructname.

Suppose that you have the C function use_struct. This function reads from the input argument but does not write to it.

#include "MyStruct.h"

double use_struct(const struct MyStruct *my_struct) {

return my_struct->f1 + my_struct->f2;
}

The C header file, MyStruct.h, defines a structure type named MyStruct:

#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
   double f1;
   double f2;
} MyStruct;

double use_struct(const struct MyStruct *my_struct);
#endif

In your MATLAB function, pass a structure as a read-only reference to use_struct. To indicate that the structure type for s has the name MyStruct that is defined in the C header file MyStruct.h, use coder.cstructname.

function y = foo
%#codegen
y = 0;
coder.updateBuildInfo('addSourceFiles','use_struct.c');

s = struct('f1',1,'f2',2);
coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
y = coder.ceval('use_struct', coder.rref(s));

To generate standalone library code, enter:

codegen -config:lib foo -report

Pass Structure Field as a Read-Only Reference

...  
s = struct('s1', struct('a', [0 1]));
y = coder.ceval('foo', coder.rref(s.s1.a));
...

You can also pass an element of an array of structures:
...  
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
a = struct('b',b);
coder.ceval('foo', coder.rref(a.b(3,4).c(2).u));
...

Input Arguments

arg — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct
Complex Number Support: Yes

Limitations

• You cannot pass these data types by reference:
  • Class or System object
  • Cell array or index into a cell array
  • If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

• If arg is an array, then coder.rref(arg) provides the address of the first element of the array. The coder.rref(arg) function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

  coder.ceval('myFun',coder.rref(arg),int32(numel(arg)));
• When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
• In MATLAB, `coder.rref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
• You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Topics
“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a
coder.screener

Package: coder

Determine if function is suitable for code generation

Syntax

coder.screener(fcn)
coder.screener(fcn_1,...,fcn_n)

Description

coder.screener(fcn) analyzes the entry-point MATLAB function, fcn. It identifies unsupported functions and language features as code generation compliance issues. It displays the code generation compliance issues in a report. If fcn calls other functions directly or indirectly that are not MathWorks® functions, coder.screener analyzes these functions. It does not analyze MathWorks functions. It is possible that coder.screener does not detect all code generation issues. Under certain circumstances, it is possible that coder.screener reports false errors.

coder.screener does not report functions that the code generator automatically treats as extrinsic. Examples of such functions are plot, disp, and figure. See “Extrinsic Functions”.

coder.screener(fcn_1,...,fcn_n) analyzes entry-point functions (fcn_1,...,fcn_n).

Examples

Identify Unsupported Functions

The coder.screener function identifies calls to functions that are not supported for code generation. It checks both the entry-point function, foo1, and the function foo2 that foo1 calls.
Write the function `foo2` and save it in the file `foo2.m`.

```matlab
function out = foo2(in)
    out = eval(in);
end
```

Write the function `foo1` that calls `foo2`. Save `foo1` in the file `foo1.m`.

```matlab
function out = foo1(in)
    out = foo2(in);
    disp(out);
end
```

Analyze `foo1`.

```matlab
coder.screener('foo1')
```

The code generation readiness report displays a summary of the unsupported MATLAB function calls. The function `foo2` calls one unsupported MATLAB function.
In the report, click the **Code Structure** tab and select the **Show MATLAB functions** check box.

This tab displays a pie chart showing the relative size of each file and how suitable each file is for code generation. In this case, the report:
• Colors `foo1.m` green to indicate that it is suitable for code generation.
• Colors `foo2.m` yellow to indicate that it requires significant changes.
• Assigns `foo1.m` a code generation readiness score of 4 and `foo2.m` a score of 3. The score is based on a scale of 1–5. 1 indicates that significant changes are required; 5 indicates that the code generation readiness tool does not detect issues.
• Displays a call tree.
The report Summary tab indicates that foo2.m contains one call to the eval function, which code generation does not support. To generate a MEX function for foo2.m, modify the code to make the call to eval extrinsic.

```
function out = foo2(in)
    coder.extrinsic('eval');
```
out = eval(in);
end

Rerun the code generation readiness tool.
coder.screener('foo1')

The report no longer flags that code generation does not support the eval function. When you generate a MEX function for foo1, the code generator dispatches eval to MATLAB for execution. For standalone code generation, the code generator does not generate code for eval.

**Identify Unsupported Data Types**

The coder.screener function identifies MATLAB data types that code generation does not support.

Write the function myfun that contains a MATLAB calendar duration array data type.

```matlab
function out = myfun1(A)
out = calyears(A);
end
```

Analyze myfun.
coder.screener('myfun1');

The code generation readiness report indicates that the calyears data type is not supported for code generation.
The report assigns myfun1 a code readiness score of 3. Before generating code, you must fix the reported issues.

**Input Arguments**

`fcn` — Name of entry-point function  
character vector | string scalar  
Name of entry-point MATLAB function that you want to analyze. Specify as a character vector or a string scalar.  
Example: `coder.screener('myfun1');`  
Data Types: `char` | `string`

`fcn_1,...,fcn_n` — List of names of entry-point functions  
character vector | string scalar  
Comma-separated list of names of entry-point MATLAB functions that you want to analyze. Specify as character vectors or string scalars.
Example: coder.screener('myfun1','myfun2');

Data Types: char | string

**Tips**

- Before using `coder.screener`, fix issues that the Code Analyzer identifies.
- Before generating code, use `coder.screener` to check that a function is suitable for code generation. Fix all the issues that it detects.
- `coder.screener` does not report functions that the code generator automatically treats as extrinsic. Examples of such functions are `plot`, `disp`, and `figure`. See “Extrinsic Functions”.

**Alternatives**

- “Run the Code Generation Readiness Tool From the Current Folder Browser”

**See Also**

**Topics**

“Functions and Objects Supported for C/C++ Code Generation”
“Code Generation Readiness Tool”

**Introduced in R2012b**
**coder.target**

Determine if code generation target is specified target

**Syntax**

```
tf = coder.target(target)
```

**Description**

`tf = coder.target(target)` returns true (1) if the code generation target is `target`. Otherwise, it returns false (0).

If you generate code for MATLAB classes, MATLAB computes class initial values at class loading time before code generation. If you use `coder.target` in MATLAB class property initialization, `coder.target('MATLAB')` returns true.

**Examples**

**Use coder.target to Parametrize a MATLAB Function**

Parametrize a MATLAB function so that it works in MATLAB or in generated code. When the function runs in MATLAB, it calls the MATLAB function `myabsval`. The generated code, however, calls a C library function `myabsval`.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)
    y = abs(u);
```

Generate a C static library for `myabsval`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```
The `codegen` function creates the library file `myabsval.lib` and header file `myabsval.h` in the folder `\codegen\lib\myabsval`. (The library file extension can change depending on your platform.) It generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```matlab
function y = callmyabsval(y)
%#codegen
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
    % Executing in MATLAB, call function myabsval
    y = myabsval(y);
else
    % add the required include statements to generated function code
    coder.updateBuildInfo('addIncludePaths', '$(START_DIR)\codegen\lib\myabsval');
    coder.cinclude('myabsval_initialize.h');
    coder.cinclude('myabsval.h');
    coder.cinclude('myabsval_terminate.h');

    % Executing in the generated code.
    % Call the initialize function before calling the
    % C function for the first time
    coder.ceval('myabsval_initialize');

    % Call the generated C library function myabsval
    y = coder.ceval('myabsval', y);

    % Call the terminate function after
    % calling the C function for the last time
    coder.ceval('myabsval_terminate');
end
```

Generate the MEX function `callmyabsval_mex`. Provide the generated library file at the command line.

```
codegen -config:mex callmyabsval codegen\lib\myabsval\myabsval.lib -args {-2.75}
```

Rather than providing the library at the command line, you can use `coder.updateBuildInfo` to specify the library within the function. Use this option to preconfigure the build. Add this line to the `else` block:

```
coder.updateBuildInfo('addLinkObjects', 'myabsval.lib', '$(START_DIR)\codegen\lib\myabsval');
```
Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```matlab
callmyabsval_mex(-2.75)
ans =
    2.7500
```

Call the MATLAB function `callmyabsval`.

```matlab
callmyabsval(-2.75)
ans =
    2.7500
```

The `callmyabsval` function exhibits the desired behavior for execution in MATLAB and in code generation.

### Input Arguments

**target — code generation target**

A character vector: 'MATLAB', 'MEX', 'Sfun', 'Rtw', 'HDL', or 'Custom'.

- 'MATLAB': Running in MATLAB (not generating code)
- 'MEX': Generating a MEX function
- 'Sfun': Simulating a Simulink model
- 'Rtw': Generating a LIB, DLL, or EXE target
- 'HDL': Generating an HDL target
- 'Custom': Generating a custom target

```matlab
Example: tf = coder.target('MATLAB')
Example: tf = coder.target("MATLAB")
```

Topics

“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a
**coder.unroll**

Unroll for-loop by making a copy of the loop body for each loop iteration

**Syntax**

coder.unroll()
coder.unroll(flag)

**Description**

coder.unroll() unrolls a for-loop. The coder.unroll call must be on a line by itself immediately preceding the for-loop that it unrolls.

Instead of producing a for-loop in the generated code, loop unrolling produces a copy of the for-loop body for each loop iteration. In each iteration, the loop index becomes constant. To unroll a loop, the code generator must be able to determine the bounds of the for-loop.

For small, tight loops, unrolling can improve performance. However, for large loops, unrolling can increase code generation time significantly and generate inefficient code.

coder.unroll is ignored outside of code generation.

coder.unroll(flag) unrolls a for-loop if flag is true. flag is evaluated at code generation time. The coder.unroll call must be on a line by itself immediately preceding the for-loop that it unrolls.

**Examples**

**Unroll a for-loop**

To produce copies of a for-loop body in the generated code, use coder.unroll.
In one file, write the entry-point function `call_getrand` and a local function `getrand`. `getrand` unrolls a `for`-loop that assigns random numbers to an `n`-by-1 array. `call_getrand` calls `getrand` with the value 3.

```matlab
function z = call_getrand
%#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
y = zeros(n, 1);
coder.unroll();
for i = 1:n
    y(i) = rand();
end
end
```

Generate a static library.

```bash
codegen -config:lib call_getrand -report
```

In the generated code, the code generator produces a copy of the `for`-loop body for each of the three loop iterations.

```c
static void getrand(double y[3])
{
    y[0] = b_rand();
    y[1] = b_rand();
    y[2] = b_rand();
}
```

**Control for-loop Unrolling with Flag**

Control loop unrolling by using `coder.unroll` with the flag argument.

In one file, write the entry-point function `call_getrand_unrollflag` and a local function `getrand_unrollflag`. When the number of loop iterations is less than 10, `getrand_unrollflag` unrolls the `for`-loop. `call_getrand` calls `getrand` with the value 50.

```matlab
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
```
function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
coder.unroll(unrollflag)
for i = 1:n
    y(i) = rand();
end
end

Generate a static library.

codegen -config:lib call_getrand_unrollflag -report

The number of iterations is not less than 10. Therefore, the code generator does not
unroll the for-loop. It produces a for-loop in the generated code.

static void getrand_unrollflag(double y[50])
{
    int i;
    for (i = 0; i < 50; i++) {
        y[i] = b_rand();
    }
}

**Use Legacy Syntax to Unroll for-Loop**

function z = call_getrand
%
#codegen
z = getrand(3);
end

function y = getrand(n)
coder.inline('never');
y = zeros(n, 1);
for i = coder.unroll(1:n)
    y(i) = rand();
end
end
Use Legacy Syntax to Control for-Loop Unrolling

```matlab
function z = call_getrand_unrollflag
%#codegen
z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
coder.inline('never');
unrollflag = n < 10;
y = zeros(n, 1);
for i = coder.unroll(1:n, unrollflag)
    y(i) = rand();
end
end
```

### Input Arguments

**flag** — Indicates whether to unroll the for-loop

*true (default) | false*

When `flag` is `true`, the code generator unrolls the for-loop. When `flag` is `false`, the code generator produces a for-loop in the generated code. `flag` is evaluated at code generation time.

### Tips

- Sometimes, the code generator unrolls a for-loop even though you do not use `coder.unroll`. For example, if a for-loop indexes into a heterogeneous cell array or into `varargin` or `varargout`, the code generator unrolls the loop. By unrolling the loop, the code generator can determine the value of the index for each loop iteration. The code generator uses heuristics to determine when to unroll a for-loop. If the heuristics fail to identify that unrolling is warranted, or if the number of loop iterations exceeds a limit, code generation fails. In these cases, you can force loop unrolling by using `coder.unroll`. See “Nonconstant Index into varargin or varargout in a for-Loop”.

Introduced in R2011a
**coder.updateBuildInfo**

Update build information object `RTW.BuildInfo`

**Syntax**

```matlab
coder.updateBuildInfo('addCompileFlags',options)  
coder.updateBuildInfo('addLinkFlags',options)  
coder.updateBuildInfo('addDefines',options)  
coder.updateBuildInfo( ___ ,group)  

coder.updateBuildInfo('addLinkObjects',filename,path)  
coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled)  
coder.updateBuildInfo('addLinkObjects',filename,path,priority, precompiled,linkonly)  
coder.updateBuildInfo( ___ ,group)  

coder.updateBuildInfo('addNonBuildFiles',filename)  
coder.updateBuildInfo('addSourceFiles',filename)  
coder.updateBuildInfo('addIncludeFiles',filename)  
coder.updateBuildInfo( ___ ,path)  
coder.updateBuildInfo( ___ ,path,group)  

coder.updateBuildInfo('addSourcePaths',path)  
coder.updateBuildInfo('addIncludePaths',path)  
coder.updateBuildInfo( ___ ,group)  
```

**Description**

`coder.updateBuildInfo('addCompileFlags',options)` adds compiler options to the build information object.

`coder.updateBuildInfo('addLinkFlags',options)` adds link options to the build information object.
coder.updateBuildInfo('addDefines',options) adds preprocessor macro definitions to the build information object.

coder.updateBuildInfo(____,group) assigns a group name to options for later reference.

coder.updateBuildInfo('addLinkObjects',filename,path) adds a link object from a file to the build information object.

coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled) specifies if the link object is precompiled.

coder.updateBuildInfo('addLinkObjects',filename,path,priority,precompiled,linkonly) specifies if the object is to be built before being linked or used for linking alone. If the object is to be built, it specifies if the object is precompiled.

coder.updateBuildInfo(____,group) assigns a group name to the link object for later reference.

coder.updateBuildInfo('addNonBuildFiles',filename) adds a nonbuild-related file to the build information object.

coder.updateBuildInfo('addSourceFiles',filename) adds a source file to the build information object.

coder.updateBuildInfo('addIncludeFiles',filename) adds an include file to the build information object.

coder.updateBuildInfo(____,path) adds the file from specified path.

coder.updateBuildInfo(____,path,group) assigns a group name to the file for later reference.

coder.updateBuildInfo('addSourcePaths',path) adds a source file path to the build information object.

coder.updateBuildInfo('addIncludePaths',path) adds an include file path to the build information object.

coder.updateBuildInfo(____,group) assigns a group name to the path for later reference.
Examples

Add Multiple Compiler Options

Add the compiler options -Zi and -Wall during code generation for function, func.

Anywhere in the MATLAB code for func, add the following line:

coder.updateBuildInfo('addCompileFlags','-Zi -Wall');

Generate code for func using the codegen command. Open the Code Generation Report.

codegen -config:lib -launchreport func

Add Source File Name

Add a source file to the project build information while generating code for a function, calc_factorial.

1. Write a header file fact.h that declares a C function factorial.

   double factorial(double x);

   fact.h will be included as a header file in generated code. This inclusion ensures that the function is declared before it is called.

   Save the file in the current folder.

2. Write a C file fact.c that contains the definition of factorial. factorial calculates the factorial of its input.

   #include "fact.h"

   double factorial(double x)
   {
     int i;
     double fact = 1.0;
     if (x == 0 || x == 1) {
       return 1.0;
     } else {
       for (i = 1; i <= x; i++) {
         fact *= i;
       }
       return fact;
     }
fact *= (double)i;
}
return fact;
}

fact.c is used as a source file during code generation.

Save the file in the current folder.

3 Write a MATLAB function calc_factorial that uses coder.ceval to call the external C function factorial.

Use coder.updateBuildInfo with option 'addSourceFiles' to add the source file fact.c to the build information. Use coder.cinclud to include the header file fact.h in the generated code.

```matlab
function y = calc_factorial(x) %#codegen
coder.cinclud('fact.h');
coder.updateBuildInfo('addSourceFiles', 'fact.c');
y = 0;
y = coder.ceval('factorial', x);
```

4 Generate code for calc_factorial using the codegen command.

```
codegen -config:dll -launchreport calc_factorial -args 0
```

Add Link Object

Add a link object LinkObj.lib to the build information while generating code for a function func. For this example, you must have a link object LinkObj.lib saved in a local folder, for example, c:\Link_Objects.

Anywhere in the MATLAB code for func, add the following lines:

```matlab
libPriority = '';
libPreCompiled = true;
libLinkOnly = true;
libName = 'LinkObj.lib';
libPath = 'c:\Link_Objects';
```
coder.updateBuildInfo('addLinkObjects', libName, libPath, ...
   libPriority, libPreCompiled, libLinkOnly);

Generate a MEX function for func using the codegen command. Open the Code Generation Report.

codegen -launchreport func

**Add Include Paths**

Add an include path to the build information while generating code for a function, adder. Include a header file, adder.h, existing on the path.

When header files do not reside in the current folder, to include them, use this method:

1. Write a header file mysum.h that contains the declaration for a C function mysum.
   
   ```
   double mysum(double, double);
   ```
   
   Save it in a local folder, for example c:\coder\myheaders.

2. Write a C file mysum.c that contains the definition of the function mysum.
   
   ```
   #include "mysum.h"
   double mysum(double x, double y)
   {
     return(x+y);
   }
   ```
   
   Save it in the current folder.

3. Write a MATLAB function adder that adds the path c:\coder\myheaders to the build information.

   Use coder.cinclude to include the header file mysum.h in the generated code.

   ```
   function y = adder(x1, x2) %#codegen
       coder.updateBuildInfo('addIncludePaths','c:\coder\myheaders');
       coder.updateBuildInfo('addSourceFiles','mysum.c');
       %Include the source file containing C function definition
       coder.cinclude('mysum.h');
       y = 0;
   ```
if coder.target('MATLAB')
    y = x1 + x2;
else
    y = coder.ceval('mySum', x1, x2);
end
end

Generate code for adder using the codegen command.

codegen -config:lib -launchreport adder -args {0,0}

Input Arguments

options — Build options
character vector | string scalar

Build options, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, options specifies the relevant build options to be added to the project’s build information.

<table>
<thead>
<tr>
<th>Leading Argument</th>
<th>Values in options</th>
</tr>
</thead>
<tbody>
<tr>
<td>'addCompileFlags'</td>
<td>Compiler options</td>
</tr>
<tr>
<td>'addLinkFlags'</td>
<td>Link options</td>
</tr>
<tr>
<td>'addDefines'</td>
<td>Preprocessor macro definitions</td>
</tr>
</tbody>
</table>

The function adds the options to the end of an option vector.

Example: coder.updateBuildInfo('addCompileFlags','-Zi -Wall')

group — Group name
character vector | string scalar

Name of user-defined group, specified as a character vector or string scalar. The value must be a compile-time constant.

The group option assigns a group name to the parameters in the second argument.
<table>
<thead>
<tr>
<th>Leading Argument</th>
<th>Second Argument</th>
<th>Parameters Named by group</th>
</tr>
</thead>
<tbody>
<tr>
<td>'addCompileFlags'</td>
<td>options</td>
<td>Compiler options</td>
</tr>
<tr>
<td>'addLinkFlags'</td>
<td>options</td>
<td>Link options</td>
</tr>
<tr>
<td>'addLinkObjects'</td>
<td>filename</td>
<td>Name of file containing linkable objects</td>
</tr>
<tr>
<td>'addNonBuildFiles'</td>
<td>filename</td>
<td>Name of nonbuild-related file</td>
</tr>
<tr>
<td>'addSourceFiles'</td>
<td>filename</td>
<td>Name of source file</td>
</tr>
<tr>
<td>'addSourcePaths'</td>
<td>path</td>
<td>Name of source file path</td>
</tr>
</tbody>
</table>

You can use group to:

- Document the use of specific parameters.
- Retrieve or apply multiple parameters together as one group.

**filename — File name**

character vector | string scalar

File name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, filename specifies the relevant file to be added to the project’s build information.

<table>
<thead>
<tr>
<th>Leading Argument</th>
<th>File Specified by filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>'addLinkObjects'</td>
<td>File containing linkable objects</td>
</tr>
<tr>
<td>'addNonBuildFiles'</td>
<td>Nonbuild-related file</td>
</tr>
<tr>
<td>'addSourceFiles'</td>
<td>Source file</td>
</tr>
</tbody>
</table>

The function adds the file name to the end of a file name vector.

Example: `coder.updateBuildInfo('addSourceFiles', 'fact.c')`

**path — Path name**

character vector | string scalar
Relative path name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, path specifies the relevant path name to be added to the project’s build information. The function adds the path to the end of a path name vector.

<table>
<thead>
<tr>
<th>Leading Argument</th>
<th>Path Specified by path</th>
</tr>
</thead>
<tbody>
<tr>
<td>'addLinkObjects'</td>
<td>Path to linkable objects</td>
</tr>
<tr>
<td>'addNonBuildFiles'</td>
<td>Path to nonbuild-related files</td>
</tr>
<tr>
<td>'addSourceFiles', 'addSourcePaths'</td>
<td>Path to source files</td>
</tr>
</tbody>
</table>

The relative path starts from the build folder. If you have a function foo contained in the folder C:\myCode, and you generate MEX code by using:

codegen foo -report

then the build folder is C:\myCode\codegen\mex\foo. You can write the path from the build folder or write the path from the current working folder in which you generate code. Reference the current working folder by using the START_DIR macro. For example, suppose that your source file is contained in C:\myCode\mySrcDir, and you generate code from C:\myCode. Write the path as in these examples:

Example:
coder.updateBuildInfo('addSourceFiles','fact.c','..\..\..\..\mySrcDir')
Example: coder.updateBuildInfo('addSourceFiles','fact.c','$\{\text{START\_DIR}\}\mySrcDir')

**priority** — Relative priority of link object

Priority of link objects.

This feature applies only when several link objects are added. Currently, only a single link object file can be added for every coder.updateBuildInfo statement. Therefore, this feature is not available for use.

To use the succeeding arguments, include '' as a placeholder argument.

**precompiled** — Variable indicating if link objects are precompiled

logical value
Variable indicating if the link objects are precompiled, specified as a logical value. The value must be a compile-time constant.

If the link object has been prebuilt for faster compiling and linking and exists in a specified location, specify true. Otherwise, the MATLAB Coder build process creates the link object in the build folder.

If linkonly is set to true, this argument is ignored.

Data Types: logical

linkonly — Variable indicating if objects must be used for linking only
logical value

Variable indicating if objects must be used for linking only, specified as a logical value. The value must be a compile-time constant.

If you want that the MATLAB Coder build process must not build or generate rules in the makefile for building the specified link object, specify true. Instead, when linking the final executable, the process should just include the object. Otherwise, rules for building the link object are added to the makefile.

You can use this argument to incorporate link objects for which source files are not available.

If linkonly is set to true, the value of precompiled is ignored.

Data Types: logical

Introduced in R2013b
coder.varsize

**Package:** coder

Declare variable-size data

**Syntax**

coder.varsize(varName1,...,varNameN)
coder.varsize(varName1,...,varNameN,ubounds)
coder.varsize(varName1,...,varNameN,ubounds,dims)

**Description**

coder.varsize(varName1,...,varNameN) declares that the variables named varName1,...,varNameN have a variable size. The declaration instructs the code generator to allow the variables to change size during execution of the generated code. With this syntax, you do not specify the upper bounds of the dimensions of the variables or which dimensions can change size. The code generator computes the upper bounds. All dimensions, except singleton dimensions on page 2-191, are allowed to change size.

Use `coder.varsize` according to these restrictions and guidelines:

- Use `coder.varsize` inside a MATLAB function intended for code generation.
- The `coder.varsize` declaration must precede the first use of a variable. For example:

  ```matlab
  ...
  x = 1;
  coder.varsize('x');
  disp(size(x));
  ...
  ```

- Use `coder.varsize` to declare that an output argument has a variable size or to address size mismatch errors. Otherwise, to define variable-size data, use the methods described in “Define Variable-Size Data for Code Generation”.
Note For MATLAB Function blocks, to declare variable-size input or output signals, use the Ports and Data Manager. See “Declare Variable-Size Inputs and Outputs”. If you provide upper bounds in a `coder.varsize` declaration, the upper bounds must match the upper bounds in the Ports and Data Manager.

For more restrictions and guidelines, see “Limitations” on page 2-189 and “Tips” on page 2-191.

`coder.varsize(varName1,...,varNameN,ubounds)` also specifies an upper bound for each dimension of the variables. All variables must have the same number of dimensions. All dimensions, except singleton dimensions on page 2-191, are allowed to change size.

`coder.varsize(varName1,...,varNameN,ubounds,dims)` also specifies an upper bound for each dimension of the variables and whether each dimension has a fixed size or a variable size. If a dimension has a fixed size, then the corresponding `ubound` element specifies the fixed size of the dimension. All variables have the same fixed-size dimensions and the same variable-size dimensions.

Examples

Address Size Mismatch Error by Using `coder.varsize`

After a variable is used (read), changing the size of the variable can cause a size mismatch error. Use `coder.varsize` to specify that the size of the variable can change.

Code generation for the following function produces a size mismatch error because `x = 1:10` changes the size of the second dimension of `x` after the line `y = size(x)` that uses `x`.

```matlab
function [x,y] = usevarsize(n)
  %#codegen
  x = 1;
  y = size(x);
  if n > 10
    x = 1:10;
  end
```

To declare that `x` can change size, use `coder.varsize`. 
function [x,y] = usevarsize(n)
  %#codegen
  x = 1;
  coder.varsize('x');
  y = size(x);
  if n > 10
    x = 1:10;
  end

If you remove the line `y = size(x)`, you no longer need the `coder.varsize` declaration because `x` is not used before its size changes.

**Declare Variable-Size Array with Upper Bounds**

Specify that `A` is a row vector whose second dimension has a variable size with an upper bound of 20.

```matlab
function fcn()
  ...
  coder.varsize('A',[1 20]);
  ...
end
```

When you do not provide `dims`, all dimensions, except singleton dimensions, have a variable size.

**Declare Variable-Size Array with a Mix of Fixed and Variable Dimensions**

Specify that `A` is an array whose first dimension has a fixed size of three and whose second dimension has a variable size with an upper bound of 20.

```matlab
function fcn()
  ...
  coder.varsize('A',[3 20], [0 1] );
  ...
end
```
Declare Variable-Size Structure Fields

If a structure field belongs to an array of structures, use colon (:) as the index expression to make the field variable-size for all elements of the array.

In this function, the statement `coder.varsize('data(:).values')` declares that the field values inside each element of data has a variable size.

```matlab
function y = varsize_field()
    %#codegen
    d = struct('values', zeros(1,0), 'color', 0);
    data = repmat(d, [3 3]);
    coder.varsize('data(:).values');

    for i = 1:numel(data)
        data(i).color = rand-0.5;
        data(i).values = 1:i;
    end

    y = 0;
    for i = 1:numel(data)
        if data(i).color > 0
            y = y + sum(data(i).values);
        end
    end
```

Declare Variable-Size Cell Array

Specify that cell array C has a fixed-size first dimension and variable-size second dimension with an upper bound of three. The `coder.varsize` declaration must precede the first use of C.

```matlab
... C = {1 [1 2]};
coder.varsize('C', [1 3], [0 1]);
y = C{1};
...
end
```

Without the `coder.varsize` declaration, C is a heterogeneous cell array whose elements have the same class and different sizes. With the `coder.varsize` declaration, C is a
homogeneous cell array whose elements have the same class and maximum size. The first dimension of each element is fixed at 1. The second dimension of each element has a variable size with an upper bound of 3.

Declare That a Cell Array Has Variable-Size Elements

Specify that the elements of cell array C are vectors with a fixed-size first dimension and variable-size second dimension with an upper bound of 5.

```matlab
... 
C = {1 2 3}; 
coder.varsize('C{:}', [1 5], [0 1]); 
C = {1, 1:5, 2:3}; 
...
```

Input Arguments

`varName1,...,varNameN` — Names of variables to declare as having a variable size
code vectors | string scalars

Names of variables to declare as having a variable size, specified as one or more character vectors or string scalars.
Example: `coder.varsize('x','y')`

`ubounds` — Upper bounds for array dimensions
[] (default) | vector of integer constants

Upper bounds for array dimensions, specified as a vector of integer constants.

When you do not specify `ubounds`, the code generator computes the upper bound for each variable. If the `ubounds` element corresponds to a fixed-size dimension, the value is the fixed size of the dimension.
Example: `coder.varsize('x','y',[1 2])`

`dims` — Indication of whether each dimension has a fixed size or a variable size
logical vector
Indication of whether each dimension has a fixed size or a variable size, specified as a logical vector. Dimensions that correspond to 0 or false in dims have a fixed size. Dimensions that correspond to 1 or true have a variable size.

When you do not specify dims, the dimensions have a variable size, except for the singleton dimensions.

Example: 
```plaintext
coder.varsize('x','y',[1 2], [0 1])
```

**Limitations**

- The `coder.varsize` declaration instructs the code generator to allow the size of a variable to change. It does not change the size of the variable. Consider this code:

  ```plaintext
  ...
  x = 7;
  coder.varsize('x', [1,5]);
  disp(size(x));
  ...
  ```

  After the `coder.varsize` declaration, `x` is still a 1-by-1 array. You cannot assign a value to an element beyond the current size of `x`. For example, this code produces a run-time error because the index 3 exceeds the dimensions of `x`.

  ```plaintext
  ...
  x = 7;
  coder.varsize('x', [1,5]);
  x(3) = 1;
  ...
  ```

- `coder.varsize` is not supported for a function input argument. Instead:
  - If the function is an entry-point function, specify that an input argument has a variable size by using `coder.typeof` at the command line. Alternatively, specify that an entry-point function input argument has a variable size by using the Define Input Types step of the app.
  - If the function is not an entry-point function, use `coder.varsize` in the calling function with the variable that is the input to the called function.

- For sparse matrices, `coder.varsize` drops upper bounds for variable-size dimensions.
- Limitations for using `coder.varsize` with cell arrays:
• A cell array can have a variable size only if it is homogeneous. When you use `coder.varsize` with a heterogeneous cell array, the code generator tries to make the cell array homogeneous. The code generator tries to find a class and maximum size that apply to all elements of the cell array. For example, consider the cell array \( c = \{1, [2 \ 3]\} \). Both elements can be represented by a double type whose first dimension has a fixed size of 1 and whose second dimension has a variable size with an upper bound of 2. If the code generator cannot find a common class and a maximum size, code generation fails. For example, consider the cell array \( c = \{'a',[2 \ 3]\} \). The code generator cannot find a class that can represent both elements because the first element is `char` and the second element is `double`.

• If you use the `cell` function to define a fixed-size cell array, you cannot use `coder.varsize` to specify that the cell array has a variable size. For example, this code causes a code generation error because \( x = \text{cell}(1,3) \) makes \( x \) a fixed-size,1-by-3 cell array.

```matlab
... 
x = cell(1,3);
coder.varsize('x',[1 5])
...
```

You can use `coder.varsize` with a cell array that you define by using curly braces. For example:

```matlab
... 
x = {1 \ 2 \ 3};
coder.varsize('x',[1 5])
...
```

• To create a variable-size cell array by using the `cell` function, use this code pattern:

```matlab
function mycell(n)
%#codegen
x = cell(1,n);
for i = 1:n
    x{i} = i;
end
end
```

See “Definition of Variable-Size Cell Array by Using cell”.

To specify upper bounds for the cell array, use `coder.varsize`.

```matlab
function mycell(n)
%#codegen
```
x = cell(1,n);
for i = 1:n
  x{i} = i;
coder.varsize('x',[1,20]);
end
end

More About

Singleton Dimension

Dimension for which size(A,dim) = 1.

Tips

- In a code generation report or a MATLAB Function report, a colon (:) indicates that a dimension has a variable size. For example, a size of 1x:2 indicates that the first dimension has a fixed size of one and the second dimension has a variable size with an upper bound of two.

- If you use coder.varsize to specify that the upper bound of a dimension is 1, by default, the dimension has a fixed size of 1. To specify that the dimension can be 0 (empty array) or 1, set the corresponding element of the dims argument to true. For example, this code specifies that the first dimension of x has a fixed size of 1 and the other dimensions have a variable size of 5.

  coder.varsize('x',[1,5,5])

  In contrast, this code specifies that the first dimension of x has an upper bound of 1 and has a variable size (can be 0 or 1).

  coder.varsize('x',[1,5,5],[1,1,1])

Note For a MATLAB Function block, you cannot specify that an input or output signal with size 1 has a variable size.

- If you use input variables or the result of a computation using input variables to specify the size of an array, it is declared as variable-size in the generated code. Do not re-use coder.varsize on the array, unless you also want to specify an upper bound for its size.
• If you do not specify upper bounds with a `coder.varsize` declaration and the code generator is unable to determine the upper bounds, the generated code uses dynamic memory allocation. Dynamic memory allocation can reduce the speed of generated code. To avoid dynamic memory allocation, specify the upper bounds by providing the `ubounds` argument.

Introduced in R2011a
**coder.wref**

Indicate write-only data to pass by reference

**Syntax**

coder.wref(arg)

**Description**

coder.wref(arg) indicates that arg is a write-only expression or variable to pass by reference to an external C/C++ function. Use coder.wref only inside a coder.ceval call. This function enables the code generator to optimize the generated code by ignoring prior assignments to arg in your MATLAB code, because the external function is assumed to not read from the data. Write to all the elements of arg in your external code to fully initialize the memory.

**Note** The C/C++ function must fully initialize the memory referenced by coder.wref(arg). Initialize the memory by assigning values to every element of arg in your C/C++ code. If the generated code tries to read from uninitialized memory, it can cause undefined run-time behavior.

See also coder.ref and coder.rref.

**Examples**

**Pass Array by Reference as Write-Only**

Suppose that you have a C function init_array.

```c
void init_array(double* array, int numel) {
    for(int i = 0; i < numel; i++) {
        array[i] = 42;
    }
}
```
The C function defines the input variable array as a pointer to a double.

Call the C function init_array to initialize all elements of y to 42:

```matlab
... 
Y = zeros(5, 10);
coder.ceval('init_array', coder.wref(Y), int32(numel(Y)));
... 
```

**Pass Multiple Arguments as a Write-Only Reference**

```matlab
... 
U = zeros(5, 10);
V = zeros(5, 10);
coder.ceval('my_fcn', coder.wref(U), int32(numel(U)), coder.wref(V), int32(numel(V)));
... 
```

**Pass Class Property as a Write-Only Reference**

```matlab
... 
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.wref(x.prop));
... 
```

**Pass Structure as a Write-Only Reference**

To indicate that the structure type is defined in a C header file, use coder.cstructname.

Suppose that you have the C function init_struct. This function writes to the input argument but does not read from it.

```c
#include "MyStruct.h"

void init_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = 1;
    my_struct->f2 = 2;
}
```
The C header file, `MyStruct.h`, defines a structure type named `MyStruct`:

```c
#ifndef MYSTRUCT
#define MYSTRUCT

typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

void init_struct(struct MyStruct *my_struct);
#endif
```

In your MATLAB function, pass a structure as a write-only reference to `init_struct`. Use `coder.cstructname` to indicate that the structure type for `s` has the name `MyStruct` that is defined in the C header file `MyStruct.h`.

```matlab
function y = foo
    %#codegen
    y = 0;
    coder.updateBuildInfo('addSourceFiles','init_struct.c');

    s = struct('f1',1,'f2',2);
    coder.cstructname(s,'MyStruct','extern','HeaderFile','MyStruct.h');
    coder.ceval('init_struct', coder.wref(s));
```

To generate standalone library code, enter:

```
codegen -config:lib foo -report
```

### Pass Structure Field as a Write-Only Reference

```matlab
...  
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.wref(s.s1.a));
...
```

You can also pass an element of an array of structures:

```matlab
...  
c = repmat(struct('u',magic(2)),1,10);
b = repmat(struct('c',c),3,6);
```
a = struct('b',b);
coder.ceval('foo', coder.wref(a.b(3,4).c(2).u));
...

Input Arguments

arg — Argument to pass by reference
scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16
| uint32 | uint64 | logical | char | struct
Complex Number Support: Yes

Limitations

• You cannot pass these data types by reference:
  • Class or System object
  • Cell array or index into a cell array
• If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

• If arg is an array, then coder.wref(arg) provides the address of the first element of the array. The coder.wref(arg) function does not contain information about the size of the array. If the C function must know the number of elements of your data, pass that information as a separate argument. For example:

coder.ceval('myFun',coder.wref(arg),int32(numel(arg));
• When you pass a structure by reference to an external C/C++ function, use coder.cstructname to provide the name of a C structure type that is defined in a C header file.
• In MATLAB, `coder.wref` results in an error. To parametrize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.

• You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

`coder.ceval` | `coder.cstructname` | `coder.opaque` | `coder.ref` | `coder.rref`

Topics
“Integrate C Code Using the MATLAB Function Block”

Introduced in R2011a
createInputDataset

Generate dataset object for root-level Inport or bus element ports in model

Syntax

[inports_dataset] = createInputDataset(model)

Description

[inports_dataset] = createInputDataset(model) generates a Simulink.SimulationData.Dataset object from the root-level Inport blocks or bus element ports in a model. Signals in the generated dataset have the properties of the root inports and the corresponding ground values at model start and stop times. You can create timetable or timeseries objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

Examples

Generate and Populate Dataset for Root-Level Inport Blocks

This example shows how to create a dataset with elements for the four root-level Inport blocks in a model. Use that dataset as a basis for creating a dataset to load signal data into the model.

The In1 block outputs a double, In2 and In3 each output a nonvirtual bus, and In4 outputs an int16.

mdl = 'ex_dataset_for_inports';
open_system(mdl)
Create a Dataset object for the root-level Inport blocks.

ds = createInputDataset(mdl)

ds =

Simulink.SimulationData.Dataset '' with 4 elements

<table>
<thead>
<tr>
<th>Name</th>
<th>BlockPath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In1 ''</td>
</tr>
<tr>
<td>2</td>
<td>In2 ''</td>
</tr>
<tr>
<td>3</td>
<td>In3 ''</td>
</tr>
<tr>
<td>4</td>
<td>In4 ''</td>
</tr>
</tbody>
</table>

- Use braces {} to access, modify, or add elements using index.

Replace the placeholder value for the first signal in the Dataset with actual signal values that you want to load into the model.

ds{1} = ds{1}.delsample('Index',[1,2]);
ds{1} = ds{1}.addsample('time',[1 3 3 10],'data',[1 1 5 5]);

Examine the In2 signal.
ds{2}

ans =

struct with fields:
    a: [1x1 timeseries]
    b: [1x1 timeseries]

For In2, create data for bus elements a and b.

ds{2}.a = ds{2}.a.delsample('Index',[1,2]);
ds{2}.a = addsample(ds{2}.a,'time',[1:10],'data',[1:10]);
ds{2}.b = timeseries((1:10)',0.1:.1:1,'Name','sig2_b');

For In3, specify data for element a of the bus, and use ground values for element b.

ds{3}.a = timeseries((1:10)',0.1:.1:1,'Name','sig3_a');

Plot ds.

plot(ds)

Set the Input configuration parameter to ds. Alternatively, you can use the Root Inport Mapper tool to set the Input parameter.

set_param(mdl,'LoadExternalInput','on');
set_param(mdl,'ExternalInput','ds');

Run the simulation. The Inport blocks use the signal data specified in ds or ground values for elements that do not have specified signal data.

sim(mdl)

**Input Arguments**

- **model** — Model for which to generate dataset for root-level Inport blocks or bus element ports
  - character vector | model handle

  Model for which to generate a dataset with an element for each root-level Inport block, specified as a character vector or model handle.
Output Arguments

inports_dataset — Dataset with an element for each root-level Inport block

A Simulink.SimulationData.Dataset object

Dataset with an element for each root-level Inport block, returned as a Simulink.SimulationData.Dataset object.

Simulink.SimulationData.Dataset MATLAB timeseries timetable “Create a Dataset Object for Inport Blocks”

Introduced in R2017a
getHardwareImplementation

Class: coder.BuildConfig
Package: coder

Get handle of copy of hardware implementation object

Syntax

hw = bldcfg.getHardwareImplementation()

Description

hw = bldcfg.getHardwareImplementation() returns the handle of a copy of the hardware implementation object.

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

hw

Handle of copy of hardware implementation object.

See Also
getStdLibInfo

Class: coder.BuildConfig
Package: coder

Get standard library information

Syntax

\[\text{[linkLibPath,linkLibExt,execLibExt,libPrefix]} = \]
\text{bldcfg.getStdLibInfo()}\]

Description

\[\text{[linkLibPath,linkLibExt,execLibExt,libPrefix]} = \]
\text{bldcfg.getStdLibInfo()} \text{ returns character vectors representing the:}\n
\begin{itemize}
  \item Standard MATLAB architecture-specific library path
  \item Platform-specific library file extension for use at link time
  \item Platform-specific library file extension for use at run time
  \item Standard architecture-specific library name prefix
\end{itemize}

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

linkLibPath

Standard MATLAB architecture-specific library path specified as a character vector. The character vector can be empty.
linkLibExt

Platform-specific library file extension for use at link time, specified as a character vector. The value is one of '.lib', '.dylib', '.so', ''.

execLibExt

Platform-specific library file extension for use at run time, specified as a character vector. The value is one of '.dll', '.dylib', '.so', ''.

linkPrefix

Standard architecture-specific library name prefix, specified as a character vector. The character vector can be empty.
**getTargetLang**

**Class:** coder.BuildConfig  
**Package:** coder

Get target code generation language

**Syntax**

```python
lang = bldcfg.getTargetLang()
```

**Description**

`lang = bldcfg.getTargetLang()` returns a character vector containing the target code generation language.

**Input Arguments**

- **bldcfg**  
  coder.BuildConfig object.

**Output Arguments**

- **lang**  
  A character vector containing the target code generation language. The value is 'C' or 'C++'.

---

2-205
getToolchainInfo

Class: coder.BuildConfig
Package: coder

Returns handle of copy of toolchain information object

Syntax

tc = bldcfg.getToolchainInfo()

Description

tc = bldcfg.getToolchainInfo() returns a handle of a copy of the toolchain information object.

Input Arguments

bldcfg
coder.BuildConfig object.

Output Arguments

tc
Handle of copy of toolchain information object.

See Also
isCodeGenTarget

**Class:** coder.BuildConfig  
**Package:** coder

Determine if build configuration represents specified target

**Syntax**

\[ tf = \text{bldcfg}.\text{isCodeGenTarget}(\text{target}) \]

**Description**

\[ tf = \text{bldcfg}.\text{isCodeGenTarget}(\text{target}) \] returns true (1) if the code generation target of the current build configuration represents the code generation target specified by `target`. Otherwise, it returns false (0).

**Input Arguments**

**bldcfg**

coder.BuildConfig object.

**target**

Code generation target specified as a character vector or cell array of character vectors.

<table>
<thead>
<tr>
<th>Specify</th>
<th>For code generation target</th>
</tr>
</thead>
<tbody>
<tr>
<td>'rtw'</td>
<td>C/C++ dynamic Library, C/C++ static library, or C/C++ executable</td>
</tr>
<tr>
<td>'sfun'</td>
<td>S-function (Simulation)</td>
</tr>
<tr>
<td>'mex'</td>
<td>MEX-function</td>
</tr>
</tbody>
</table>

Specify `target` as a cell array of character vectors to test if the code generation target of the build configuration represents one of the targets specified in the cell array.
For example:

```matlab
... mytarget = {'sfun','mex'};
tf = bldcfg.isCodeGenTarget(mytarget);
...```

tests whether the build context represents an S-function target or a MEX-function target.

**Output Arguments**

tf

The value is true (1) if the code generation target of the build configuration represents the code generation target specified by `target`. Otherwise, the value is false (0).

**See Also**
coder.target
isMatlabHostTarget

Class: coder.BuildConfig
Package: coder

Determine if hardware implementation object target is MATLAB host computer

Syntax

\[
tf = \text{bldcfg}.\text{isMatlabHostTarget}()
\]

Description

\[
tf = \text{bldcfg}.\text{isMatlabHostTarget}() \text{ returns true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, it returns false (0).}
\]

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

tf

Value is true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, the value is false (0).

See Also

2-209
coder.ExternalDependency.getDescriptiveName

Class: coder.ExternalDependency
Package: coder

Return descriptive name for external dependency

Syntax

extname = coder.ExternalDependency.getDescriptiveName(bldcfg)

Description

extname = coder.ExternalDependency.getDescriptiveName(bldcfg) returns the name that you want to associate with an “external dependency” on page 2-211. The code generator uses the external dependency name for error messages.

Input Arguments

bldcfg
coder.BuildConfig object. Use coder.BuildConfig methods to get information about the “build context” on page 2-211

You can use this information when you want to return different names based on the build context.

Output Arguments

extname
External dependency name returned as a character vector.
Examples

Return external dependency name

Define a method that always returns the same name.

```matlab
function myextname = getDescriptiveName(~)
    myextname = 'MyLibrary'
end
```

Return external library name based on the code generation target

Define a method that uses the build context to determine the name.

```matlab
function myextname = getDescriptiveName(context)
    if context.isMatlabHostTarget()
        myextname = 'MyLibrary_MatlabHost';
    else
        myextname = 'MyLibrary_Local';
    end
end
```

More About

external dependency

External code interface represented by a class derived from a `coder.ExternalDependency` class. The external code can be a library, object files, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target
• Target hardware
• Build toolchain

See Also
coder.BuildConfig | coder.ExternalDependency | coder.ceval |
encoder.updateBuildInfo

Topics
“Develop Interface for External C/C++ Code” (MATLAB Coder)

“Integrate External/Custom Code” (MATLAB Coder)
**coder.ExternalDependency.isSupportedContext**

**Class:** coder.ExternalDependency  
**Package:** coder

Determine if build context supports external dependency

**Syntax**

```matlab
tf = coder.ExternalDependency.isSupportedContext(bldcfg)
```

**Description**

`tf = coder.ExternalDependency.isSupportedContext(bldcfg)` returns true (1) if you can use the “external dependency” on page 2-214 in the current “build context” on page 2-214. You must provide this method in the class definition for a class that derives from `coder.ExternalDependency`.

If you cannot use the “external dependency” on page 2-214 in the current “build context” on page 2-214, display an error message and stop code generation. The error message must describe why you cannot use the external dependency in this build context. If the method returns false (0), the code generator uses a default error message. The default error message uses the name returned by the `getDescriptiveName` method of the `coder.ExternalDependency` class.

Use `coder.BuildConfig` methods to determine if you can use the external dependency in the current build context.

**Input Arguments**

`bldcfg`  
`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-214.
Output Arguments

tf

Value is true (1) if the build context supports the external dependency.

Examples

Report error when build context does not support external library

This method returns true(1) if the code generation target is a MATLAB host target. Otherwise, the method reports an error and stops code generation.

Write isSupportedContext method.

```matlab
function tf = isSupportedContext(ctx)
    if ctx.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end
```

More About

external dependency

External code interface represented by a class derived from coder.ExternalDependency class. The external code can be a library, object file, or C/C++ source.

build context

Information used by the build process including:

• Target language
• Code generation target
• Target hardware
• Build toolchain

coder.ExternalDependency.updateBuildInfo

**Class:** coder.ExternalDependency  
**Package:** coder

Update build information

**Syntax**

coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)

**Description**

coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg) updates the build information object whose handle is buildInfo. After code generation, the build information object has standard information. Use this method to provide additional information required to link to external code. Use coder.BuildConfig methods to get information about the “build context” on page 2-217.

You must implement this method in a subclass of coder.ExternalDependency. For an example, see coder.ExternalDependency.

**Input Arguments**

**buildInfo**

Handle of build information object.

**bldcfg**

coder.BuildConfig object. Use coder.BuildConfig methods to get information about the “build context” on page 2-217.
Limitations

• The build information method `AddIncludeFiles` has no effect in a `coder.ExternalDependency.updateBuildInfo` method.

More About

build context

Information used by the build process including:

• Target language
• Code generation target
• Target hardware
• Build toolchain

convertToSLDataset

Convert contents of MAT-file to Simulink.SimulationData.Dataset object

Syntax

success=convertToSLDataset(source,destination)
success=convertToSLDataset(source,destination,datasetname)

Description

success=convertToSLDataset(source,destination) converts the contents of a MAT-file (source) to a destination MAT-file (destination).

success=convertToSLDataset(source,destination,datasetname) names the dataset datasetname.

When converting structure signal data, the function names the signal using the value contained in the label field of the structure signal field, such as: mySignal.signal(1).label.

This function ignores time expressions in source.

Examples

Save Signals to Dataset in file2.mat

Save signals from file1.mat to a dataset named file1 in file2.mat.

success=convertToSLDataset('file1.mat','file2.mat')

Save Signals to Dataset Named myDataset in file2.mat

Save signals from file1.mat to a dataset named myDataset in file2.mat.
success=convertToSLDataset('file1.mat','file2.mat','myDataset')

Input Arguments

source — MAT-file
character vector
MAT-file that contains Simulink inputs.

destination — MAT-file
character vector
MAT-file to contain Simulink.SimulationData.Dataset converted from contents of source.

datasetname — Data set name
character vector
Data set name for new Simulink.SimulationData.Dataset object.

Output Arguments

success — Outcome of conversion
binary
Outcome of conversion, specified as binary:

- 1
  Conversion is successful.
- 0
  Conversion is not successful.

See Also

Introduced in R2016a
**copy**

Copy a configuration set

**Syntax**

```matlab
copyCs = copy(cs)
```

**Description**

`copyCs = copy(cs)` returns a copy of a configuration set.

**Examples**

**Attach New Configuration Set to a Model**

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```matlab
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```matlab
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```matlab
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.
attachConfigSet('vdp',develConfig);

**Input Arguments**

*cs — Configuration set*  
`ConfigSet object`  
Configuration set object to copy, specified as a `ConfigSet` object.

**Output Arguments**

*copyCs — Copy of configuration set*  
`ConfigSet object`  
A copy of the configuration set, specified as a `ConfigSet` object.

*Introduced before R2006a*
createCategory

(Not recommended) Create category of project labels

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

createCategory(proj, categoryName)
createCategory(proj, categoryName, dataType)
createCategory(proj, categoryName, dataType, single-valued)

**Description**

`createCategory(proj, categoryName)` creates a new category of labels `categoryName` in the project `proj`.

`createCategory(proj, categoryName, dataType)` specifies the class of data to store in labels of the new category.

`createCategory(proj, categoryName, dataType, single-valued)` specifies a single-valued category, where you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

**Examples**

**Create a New Category of Labels for File Ownership**

Create a new category of labels for file ownership, and attach a new label and label data to a file.

Open the airframe project and create a project object.
Create a new category of labels, called **Engineers**, to denote file ownership in a project. These labels have the char datatype for attaching character vector data.

```matlab
createCategory(proj,'Engineers','char');
```

Use **findCategory** to get the new category.

```matlab
enGINEERSCATEGORY = findCategory(proj,'Engineers');
```

Create labels in the new category.

```matlab
createLabel(EENGINEERSCATEGORY,'Tom');
createLabel(EENGINEERSCATEGORY,'Dick')
createLabel(EENGINEERSCATEGORY,'Harry')
```

Attach one of the new labels to a file in the project.

```matlab
myfile = findFile(proj,'models/AnalogControl.slx')
addLabel(myfile,'Engineers','Tom');
```

Get the label and add data.

```matlab
label = findLabel(file,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)
```

Label with properties:

- File: [1x80 char]
- Data: 'Maintenance responsibility'
- DataType: 'char'
- Name: 'Tom'
- CategoryName: 'Engineers'

### Create a New Category of Labels with Datatype Double

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```
Create a new category of labels.

```matlab
createCategory(proj,'Coverage','double')
```

category =

Category with properties:

- Name: 'Coverage'
- DataType: 'double'
- LabelDefinitions: []

Find out what you can do with the new category.

```matlab
category = findCategory(proj, 'Coverage');
methods(category)
```

Methods for class slproject.Category:

- findLabel
- removeLabel
- createLabel

**Create a Single-Valued Category**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a category of labels for file ownership, and specify single-valued to restrict only one label in the category per file.

```matlab
createCategory(proj,'Engineers','char', 'single-valued');
```

**Input Arguments**

- **proj** — Project
  
  Project, specified as a project object. Use simulinkproject to create a project object to manipulate a project at the command line.
**categoryName — Name of category**
character vector

Name of the category of labels to create, specified as a character vector.

**dataType — Class of data to store in labels**
character vector

The class of data to store in labels in the new category, specified as a character vector.

**single-valued — Single-valued category**
character vector

Single-valued category, specified as a character vector. Single-valued means you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

**Tips**

After you create a new category, you can create labels in the new category. See `createLabel`.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions
createLabel | simulinkproject

Introduced in R2013a
createLabel

(Not recommended) Define project label

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

createLabel(category,newLabelName)

**Description**

`createLabel(category,newLabelName)` creates a new label, `newLabelName`, in a category. Use this syntax if you previously got a category by accessing a `Categories` property, e.g., using a command like `proj.Categories(1)`.

Use `addLabel` instead to create and attach a new label in an existing category using a single step.

Use `createCategory` first if you want to make a new category of labels.

**Examples**

**Create a New Label**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Examine the first existing category.

```matlab
cat = proj.Categories(1)
```
Define a new label in the category.

createLabel(cat,'Future');

Create a New Category of Labels for File Ownership

Open the airframe project and create a project object.

sldemo_slproject_airframe
proj = simulinkproject;

Create creates a new category of labels called Engineers which can be used to denote file ownership in a project. These labels have the char datatype for attaching character vector data.

createCategory(proj,'Engineers','char');

Use findCategory to get the new category.

engineersCategory = findCategory(proj,'Engineers');

Create labels in the new category.

createLabel(engineersCategory,'Tom');
createLabel(engineersCategory,'Dick');
createLabel(engineersCategory,'Harry');

Attach one of the new labels to a file in the project.

myfile = findFile(proj,'models/AnalogControl.slx')
addLabel(myfile,'Engineers', 'Tom');

Get the label and add data.
label = findLabel(myfile,'Engineers','Tom');
label.Data = 'Maintenance responsibility';
disp(label)

Label with properties:

File: [1x80 char]
Data: 'Maintenance responsibility'
DataType: 'char'
Name: 'Tom'
CategoryName: 'Engineers'

Input Arguments

category — Category

category object

Category for the new label, specified as a category object. Get the category by accessing a Categories property, e.g. with a command like proj.Categories(1), or use findCategory. To create a new category, use createCategory.

newLabelName — The name of the new label to define

character vector

The name of the new label to define, specified as a character vector.

Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.
The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions
addLabel | createCategory

Introduced in R2013a
addStartupFile

(Not recommended) Add startup file to project

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

addStartupFile(proj, file)

**Description**

addStartupFile(proj, file) adds a startup file to the project proj. Startup files automatically run (.m and .p files), load (.mat files), or open (Simulink models) when you open the project.

**Examples**

**Add a Startup File**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```matlab
filepath = fullfile(proj.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add the new model to the project.

```matlab
projectFile = addFile(proj, filepath)
```
Automatically open the model when the project opens, by making it a startup file.

addStartupFile(proj, filepath);

**Input Arguments**

proj — Project

*project object*

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

file — Path of file

*character vector*

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentUserProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

**See Also**

`simulinkproject`
Introduced in R2017b
addShutdownFile

(Not recommended) Add shutdown file to project

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see .

**Syntax**

addShutdownFile(proj, file)

**Description**

addShutdownFile(proj, file) adds a shutdown file to the project proj. When you close the project, it runs the shutdown file automatically. Use the shutdown list to specify executable MATLAB code to run as the project shuts down.

**Examples**

**Add a Shutdown File**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```matlab
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.
addShutdownFile(project, filepath);

**Input Arguments**

`proj — Project`  
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

`file — Path of file`  
character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: `'utilities/myscript.m'`

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

**See Also**

`simulinkproject`
Introduced in R2017b
removeStartupFile

(Not recommended) Remove startup file from project startup list

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

removeStartupFile(proj, file)

**Description**

removeStartupFile(proj, file) removes the startup file from the startup list in the project proj.

**Examples**

**Remove a Startup File**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new file.

```matlab
filepath = fullfile(proj.RootFolder, 'new_model.slx')
    new_system('new_model');
    save_system('new_model', filepath)
```

Add the new model to the project.

```matlab
projectFile = addFile(proj, filepath)
```
Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Remove the startup file.

```
removeStartupFile(proj, filepath);
```

## Input Arguments

**proj** — Project

Project object

- Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

**file** — Path of file

Character vector

- Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

## Compatibility Considerations

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

simulinkproject

Introduced in R2017b
removeShutdownFile

(Not recommended) Remove shutdown file from project shutdown list

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
removeShutdownFile(proj, file)
```

**Description**

`removeShutdownFile(proj, file)` removes the shutdown file from the shutdown list in the project `proj`.

**Examples**

**Remove a Shutdown File**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```matlab
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```matlab
addShutdownFile(project, filepath);
```

Remove the shutdown file.
removeShutdownFile(project, filepath);

**Input Arguments**

**proj — Project**
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

**file — Path of file**
character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘utilities/myscript.m’

**Compatibility Considerations**

**Simulink project API is not recommended**

`simulinkproject`
Introduced in R2017b
**delete_block**

Delete blocks from Simulink system

**Syntax**

delete_block(blockArg)

**Description**

delete_block(blockArg) deletes the specified blocks from a system. Open the system before you delete blocks.

**Examples**

**Delete Block Using Full Path Name**

Delete the block Mu from the vdp system.

```matlab
open_system('vdp')
delete_block('vdp/Mu')
```

**Delete Block Using Block Handle**

Delete the block Out2 from the vdp system using the block handle.

Open the vdp system.

```matlab
open_system('vdp')
```

Interactively select the block Out1. Get the block’s handle and assign it to the variable `Out1_handle`. Delete the block using the handle.
Out1_handle = get_param(gcb,'Handle');
delete_block(Out1_handle)

Delete Blocks Using Vector of Handles

Delete three blocks from the vdp system.

Open the vdp system. Add three blocks and assign their handles to variables.

open_system('vdp')
Constant_handle = add_block('built-in/Constant','vdp/MyConstant');
Gain_handle = add_block('built-in/Gain','vdp/MyGain');
Outport_handle = add_block('built-in/Outport','vdp/MyOutport');

Delete the blocks you added using a vector of handles.

delete_block([Constant_handle Gain_handle Outport_handle])

Input Arguments

blockArg — Blocks to delete
full path name | handle | vector of handles | 1-D cell array of handles or block path names

Blocks to delete, specified as the full block path name, a handle, a vector of handles, or a 1-D cell array of handles or block path names.

Example: 'vdp/Mu'
Example: [handle1 handle2]
Example: {'vdp/Mu' 'vdp/Out1' 'vdp/Out2'}

See Also

add_block

Introduced before R2006a
delete_line

Delete line from Simulink model

Syntax

delem_line(sys,out,in)
delem_line(sys,point)
delem_line(lineHandle)

Description

delem_line(sys,out,in) deletes the line from the model or subsystem sys that connects the output port out to the input port in.

delem_line(sys,point) deletes the line that includes the point point.

delem_line(lineHandle) deletes the line using the line handle.

Examples

Remove Line Using Block Port Names

For the model vdp, remove the line connecting the Product block with the Gain block.

load_system('vdp');
delem_line('vdp','Product/1','Mu/1');

Remove Line Using Line Handle

For the model vdp, remove a line using the line handle. You can get the line handle using different techniques.
load_system('vdp');
h = get_param('vdp/Mu','LineHandles');
delete_line(h.Outport(1));

Get a line handle when you create the line. Delete the line using that handle.

a = add_line('vdp','Mu/1','Sum/2');
delete_line(a)

**Delete a Line Using a Point**

You can use a point on the line to delete the whole line.

Find the port coordinates for the block Mu in the model vdp.

```matlab
open_system('vdp');
mu = get_param('vdp/Mu','PortConnectivity');
mu.Position
ans = 1×2
    190   150
ans = 1×2
    225   150
```

The line that connects the Mu block to the Sum block starts at the output port, which is at (225,150). You can use any point to the right of that point along the same x-axis to delete the line.

```matlab
delete_line('vdp',[230,150]);
```

**Delete Segments of Branched Lines**

Use `delete_line` with branched lines to remove the segment for any connection.

Open the model vdp.

```matlab
open_system('vdp');
```
Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```

Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```

Delete the line segment from x2 to the Product block.

```
delete_line('vdp','x2/1','Product/2')
```
Input Arguments

sys — Model or subsystem to delete line from
character vector

Model or subsystem to delete the line from, specified as a character vector.
Example: 'vdp', 'f14/Controller'

out — Block output port to delete line from
block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use 'PortHandles' with get_param to get the handles.
Example: 'Mu/1', 'Subsystem/2'

in — Block input port to delete line from
block/port name or number character vector | port handle
Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
  - An enabled subsystem is Enable.
  - A triggered subsystem is Trigger.
  - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to delete the line from.

Use 'PortHandles' with get_param to get handles.

Example: 'Mu/1', 'Subsystem/2'

**point** — Point on the line you want to delete

1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: [150 200]

**lineHandle** — Handle of the line you want to delete

Handle of the line you want to delete. You can get the line handle by using get_param with the 'LineHandles' option or by assigning the line to a handle when you create it programmatically.

See Also

add_line | get_param

Introduced before R2006a
**delete_param**

Delete system parameter added via `add_param` command

**Syntax**

```
delete_param('sys','parameter1','parameter2',...)```

**Description**

This command deletes parameters that were added to the system using the `add_param` command. The command displays an error message if a specified parameter was not added with the `add_param` command.

**Examples**

The following example

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
delete_param('vdp','DemoName')
```

adds the parameters DemoName and EquationOrder to the vdp system, then deletes DemoName from the system.

**See Also**

`add_param`

*Introduced before R2006a*
dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

files = dependencies.fileDependencyAnalysis('modelname')
[files, missing] = dependencies.fileDependencyAnalysis('modelname')
[files, missing, depfile] = dependencies.fileDependencyAnalysis('modelname')
[files, missing, depfile, manifestfile] = dependencies.fileDependencyAnalysis('modelname', 'manifestfile')

Description

files = dependencies.fileDependencyAnalysis('modelname') returns files, a cell array of character vectors containing the full paths of all existing files referenced by the model modelname.

[files, missing] = dependencies.fileDependencyAnalysis('modelname') returns files, all existing files referenced by the model modelname, and any referenced files that cannot be found in missing.

[files, missing, depfile] = dependencies.fileDependencyAnalysis('modelname') also returns depfile, the full path of the user dependencies (.smd) file, if it exists, that stores the names of any files you manually added or excluded.

[files, missing, depfile, manifestfile] = dependencies.fileDependencyAnalysis('modelname', 'manifestfile') also creates a manifest file with the name and path specified in manifestfile.

Input Arguments

modelname

Character vector specifying the name of the model to analyze for dependencies.
manifestfile

(Optional) Character vector to specify the name of the manifest file to create. You can specify a full path or just a file name (in which case the file is created in the current folder). The function adds the suffix .smf to the user-specified name.

Output Arguments

files

A cell array of character vectors containing the full-paths of all existing files referenced by the model modelname. If there is only one dependency, the return is a character vector. If there are no dependencies, the return is empty.

Default: []

missing

A cell array of character vectors containing the names of any files that are referenced by the model modelname, but cannot be found.

Default: []

depfile

Character vector containing the full path of a user dependencies (.smd) file, if it exists, that stores the names of any files you manually added or excluded. Simulink uses the .smd file to remember your changes the next time you generate a manifest. See “Edit Manifests”.

Default: []

manifestfile

Character vector containing the name and path of the new manifest file.

Default: []
Examples

The following code analyses the model `mymodel` for file dependencies:

```matlab
files = dependencies.fileDependencyAnalysis('mymodel')
```

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Tip

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Alternatives

If your file is in a project, use `listRequiredFiles` instead.

You can interactively run dependency analysis in a project. See “Run Dependency Analysis”.

To create a report to identify where dependencies arise, find required toolboxes, and for more control over dependency analysis options, you can interactively generate a manifest and report. See “Analyze Model Dependencies”.

To programmatically check which `toolboxes` are required, see `dependencies.toolboxDependencyAnalysis`.

See Also

`dependencies.toolboxDependencyAnalysis` | `listRequiredFiles`

Topics

“What Are Model Dependencies?”
Introduced in R2012a
dependencies.toolboxDependencyAnalysis

Find toolbox dependencies

Syntax

names = dependencies.toolboxDependencyAnalysis(files_in)

[ names, folders ] = dependencies.toolboxDependencyAnalysis(files_in)

Description

names = dependencies.toolboxDependencyAnalysis(files_in) returns names, a cell array of toolbox names required by the files in files_in.

[ names, folders ] = dependencies.toolboxDependencyAnalysis(files_in) returns toolbox names and also a cell array of the toolbox folders.

Tip In a project, you can interactively run dependency analysis. You can find the required toolboxes for the whole project or for selected files. You can see which products a new team member requires to use the project, or find which file is introducing a product dependency. See “Find Required Toolboxes”.

Input Arguments

files_in

Cell array of character vectors containing .m, .mdl, or .slx files on the MATLAB path. Simulink model names (without file extension) are also allowed.

Default: [ ]
Output Arguments

names
Cell array of toolbox names required by the files in files_in.

folders
(Optional) Cell-array of the required toolbox folders.

Examples

The following code reports the detectable required toolboxes for the model vdp:

```matlab
files_in={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files_in)
names =
    'MATLAB'    'Simulink'    'Simulink Coder'
```

To find all detectable toolbox dependencies of your model and the files it depends on:

1 Call fileDependencyAnalysis on your model.
   
   For example:
   ```matlab
   files = dependencies.fileDependencyAnalysis('mymodel')
   
   files =
       'C:\Work\foo.m'
       'C:\Work\mymodel.mdl'
   ```

2 Call toolboxDependencyAnalysis on the files output of step 1.
   
   For example:
   ```matlab
   tbxes = dependencies.toolboxDependencyAnalysis(files)
   
   tbxes =
   [1x24 char]    'MATLAB'    'Simulink Coder'    'Simulink'
   ```

To view long product names examine the tbxes cell array as follows:
The function `dependencies.toolboxDependencyAnalysis` looks for toolbox dependencies of the files in `files_in` but does not analyze any subsequent dependencies. See “Examples” on page 2-256.

For command-line dependency analysis, the analysis uses the default settings for analysis scope to determine required toolboxes. For example, if you have code generation products, then the check **Find files required for code generation** is on by default and Simulink Coder is always reported as required. See “Required Toolboxes” in the manifest documentation for more examples of how your installed products and analysis scope settings can affect reported toolbox requirements.

**Alternatives**

In a project, you can interactively run dependency analysis and find the required toolboxes for the whole project or for selected files. See “Find Required Toolboxes”.

For a model that is not in a project, you can interactively generate a manifest and report. You can create a report to identify where dependencies arise, and control dependency analysis options. See “Analyze Model Dependencies”.

To programmatically check which files are required, see `dependencies.fileDependencyAnalysis`.  

```
tbxes{:}
ans = 
  Image Processing Toolbox
ans = 
  MATLAB
ans = 
  Simulink Coder
ans = 
  Simulink
```

Introduced in R2012a
**depview**

Display graph of model referencing dependencies with or without library dependencies

**Syntax**

depview(sys)

depview(sys,Name,Value)

**Description**

depview opens the “Model Dependency Viewer”. While view_mdlrefs also opens the Model Dependency Viewer, depview provides programmatic options that allow you to open a specific configuration of the Model Dependency Viewer.

depview(sys) opens the Model Dependency Viewer, which displays a graph of dependencies for the model or library specified by sys.

depview(sys,Name,Value) opens the Model Dependency Viewer as specified by one or more Name,Value pair arguments.

**Examples**

**Open Model Dependency Viewer with Default Settings**

Open the default Model Dependency Viewer for the model sldemo_mdlref_depgraph.

depview('sldemo_mdlref_depgraph');
In Model Files view, node appearance corresponds to file type.

**Open Model Dependency Viewer with Custom Settings**

Open the Model Dependency Viewer for the model `sldemo_mdlref_depgraph` in **Model Instances** view with a Horizontal layout.

```
depview('sldemo_mdlref_depgraph','ModelReferenceInstance',true,'ShowHorizontal',true);
```
In **Model Instances** view, node appearance corresponds to simulation mode.

**Input Arguments**

```plaintext
sys — Name or path of model or library
    ' ' (default) | character vector
```

Name or path of model or library, specified as a character vector.

Data Types: `char`

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example:
```plaintext
depview('sldemo_mdlref_depgraph','ModelReferenceInstance',true,'ShowFullPath',true,'ShowHorizontal',true)
```
**FileDependenciesExcludingLibraries — Graph with only models**
false (default) | true

To open a Model Dependency Viewer that shows only models, set this parameter to 'true'. In this view, node appearance corresponds to file type.

**Dependencies**

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to 'true'.

**FileDependenciesIncludingLibraries — Graph with models and user-defined libraries**
true (default) | false

To open a Model Dependency Viewer that shows models and user-defined libraries, use the default setting. In this view, node appearance corresponds to file type.

**Dependencies**

To set this parameter to 'false', enable 'FileDependenciesExcludingLibraries' or 'ModelReferenceInstance'. You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to 'true'.

**FactoryDependencies — Graph with models, user-defined libraries, and built-in libraries**
false (default) | true

To open a Model Dependency Viewer that shows models, user-defined libraries, and built-in libraries, set this parameter to 'true'. In this view, node appearance corresponds to file type.

**Dependencies**

To enable this option, set 'FileDependenciesIncludingLibraries' to 'true'.

**ModelReferenceInstance — Graph with only models that shows each model instance separately**
false (default) | true
To open a Model Dependency Viewer that shows each instance of a model as a separate node in the graph, set this parameter to 'true'. In this view, node appearance corresponds to simulation mode.

**Dependencies**

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to 'true'.

**ShowFullPath — Full path for referenced models and libraries**
false (default) | true

To open a Model Dependency Viewer that shows the full path from the top model to each referenced model or library, set this parameter to 'true'. By default, the Model Dependency Viewer shows only the file name in each node. This parameter is available for only the **Model Instances** view.

**Dependencies**

To enable this option, set 'ModelReferenceInstance' to 'true'.

**ShowHorizontal — Horizontal dependency display**
false (default) | true

To open a Model Dependency Viewer that shows referenced models and libraries to the right of their parents, set this parameter to 'true'. By default, the Model Dependency Viewer shows referenced models and libraries below their parents.

**Introduced in R2006b**
**detachConfigSet**

Dissociate configuration set or configuration reference from model

**Syntax**

detachConfigSet(model, configObjName)

**Arguments**

model
   The name of an open model, or gcs to specify the current model

configObjName
   The name of a configuration set (Simulink.ConfigSet) or configuration reference (Simulink.ConfigSetRef)

**Description**

detachConfigSet detaches the configuration set or configuration reference (configuration object) specified by configObjName from model. If no such configuration object is attached to the model, an error occurs.

**Examples**

The following example detaches the configuration object named DevConfig from the current model. The code is the same whether DevConfig is a configuration set or configuration reference.

detachConfigSet(gcs, 'DevConfig');

Introduced in R2006a
disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

`retVal = disableimplicitsignalresolution('model')`
`retVal = disableimplicitsignalresolution('model', displayOnly)`

Description

`retVal = disableimplicitsignalresolution('model')` inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans `model`, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on `model`:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's `SignalResolutionControl` parameter to 'UseLocalSettings' (GUI: **Explicit Only**).

  If `SignalResolutionControl` is already set to 'UseLocalSettings' or to 'None', the function takes no action and returns a warning.

- If any Stateflow output data resolves to a Simulink signal object:
  - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
  - Explicitly label the output signal of the Stateflow chart.
• Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with `displayOnly` defaulted to or specified as false.

`retVal = disableimplicitsignalresolution('model', displayOnly)` is equivalent to `disableimplicitsignalresolution(model)` if `displayOnly` is false.

If `displayOnly` is true, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

**Input Arguments**

displayOnly

Boolean specifying whether to change the model (`false`) or just generate a report (`true`).

Default: `false`

model

Model name or handle

**Output Arguments**

retVal

A MATLAB structure containing:

Signals

Handles to ports with signal names that resolve to signal objects

States

Handles to blocks with states that resolve to signal objects

**See Also**

Simulink.Signal
Topics
“Data Validity Diagnostics Overview”
“Symbol Resolution”

Introduced in R2007a
docblock

Get or set editor invoked by Simulink DocBlock

Syntax

docblock(setEditorType,command)
editCommand = docblock(getEditorType)

Description

docblock(setEditorType,command) uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the Editor/Debugger Preferences pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

editCommand = docblock(getEditorType) returns the current command to open the specified editor from a DocBlock block.

Input Arguments

**setEditorType** — File type whose editor command to set

'setEditorHTML' | 'setEditorDOC' | 'setEditorTXT'

File type whose editor command you want to set, specified as 'setEditorHTML', 'setEditorDOC', or 'setEditorTXT'.

**command** — Command to open file in editor

character vector | ''
Command to open the specified file type in an editor from the MATLAB command prompt, specified as a character vector. Use "" to reset to the default editor for that file type.

In the command, use the "%<FileName>" token to represent the full pathname to the document.

getEditorType — File type of the editor command to return

'getEditorHTML' | 'getEditorDOC' | 'getEditorTXT'

File type of the editor command to return, specified as 'getEditorHTML', 'getEditorDOC', or 'getEditorTXT'.

Output Arguments

editCommand — Command to open the editor
character vector

Command to open the editor, returned as a character vector.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

docblock('setEditorTXT','system(''notepad "%<FileName>"'');')

Set and Get Current HTML Editor

You can use the docblock command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

docblock('setEditorHTML',...
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &'');')

Get the current HTML editor.
htmlEd = docblock('getEditorHTML')
htmlEd =
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');'

**Reset Text Editor to Default**

Specify Notepad as the DocBlock editor for text files.

docblock('setEditorTXT','system(''notepad "%<FileName>''');')

Get the current text editor.

txtEd = docblock('getEditorTXT')
txtEd =
    'system('notepad "%<FileName>"');'

Reset the editor to the default editor.

docblock('setEditorTXT','')

**Introduced in R2007a**
**edittime.getDisplayIssues**

Check whether model design warnings and errors is on

**Syntax**

val = edittime.getDisplayIssue

**Description**

Use the `val = edittime.getDisplayIssue` function to check whether model design errors and warnings is on.

**Examples**

**Enable model design errors and warnings via the command-line**

By default, model design errors and warnings are visible while you edit a model. You can turn them off by entering this command at the MATLAB command line.

`edittime.setDisplayIssues('off')`

You can turn them on by entering this command at the MATLAB command line.

`edittime.setDisplayIssues('on')`

You can check whether they are on by entering this command at the MATLAB command line.
val=edittime.getDisplayIssues

**Output Arguments**

val — Returns on or off

char

If edit-time checking is on, this function returns on. If edit-time checking is off, this function returns off.

**See Also**

edittime.setDisplayIssues

**Topics**

“Model Editing Environment”

**Introduced in R2019a**
**edittime.setDisplayIssues**

Detect model design errors and warnings

**Syntax**

edittime.setDisplayIssues(value)

**Description**

`edittime.setDisplayIssues(value)` function sets whether to display model design errors and warnings while you design your model. This function is equivalent to selecting *Display > Errors & Warnings*. This setting persists for all models.

**Examples**

**Enable model design errors and warnings through the command-line**

By default, model design errors and warnings are visible while you edit a model. You can turn them off. At the MATLAB command line, enter:

```
edittime.setDisplayIssues('off')
```

To turn on errors and warnings, at the MATLAB command line, enter:

```
edittime.setDisplayIssues('on')
```

**Input Arguments**

`value` — Enable model design warning and error detection

character vector

To enable warnings and errors while you edit your model, set `value` to `on`. To disable warnings and errors while you edit, set `value` to `off`. 

2-274
Data Types: char

edittime.getDisplayIssues

Topics
“Model Editing Environment”

Introduced in R2019a
export

(Not recommended) Export project to zip

Note simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

Syntax

export(proj, zipFileName)
export(proj, zipFileName, definitionType)

Description

export(proj, zipFileName) exports the project proj to a zip file specified by zipFileName. The zip archive preserves the project files, structure, labels, and shortcuts, and does not include any source control information. You can use the zip archive to send the project to customers, suppliers, or colleagues who do not have access to your source control repository. Recipients can create a new project from the zip archive by clicking New in the Project Tool, and then in the start page, clicking Archive.

export(proj, zipFileName, definitionType) exports the project using the specified definitionType for the project definition files, single or multiple. If you do not specify definitionType, the project's current setting is used. Use the definitionType export option if you want to change project definition file management from the type selected when the project was created. You can control project definition file management in the preferences.

Examples

Export a Project to a Zip File

Open the airframe project and create a project object.
sldemo_slproject_airframe;
proj = simulinkproject;

Export the project to a zip file.
export(proj,'airframeproj.zip')

**Input Arguments**

**proj — Project**

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

**zipFileName — Zip file name or path**

character vector

Zip file name or path, specified as a character vector ending in the file extension `.zip`. If `zipFileName` is a filename, Simulink exports the file to the current folder. You can also specify a fully qualified path name.

Example: `'project.zip'`

Data Types: char

**definitionType — Definition file type**

`slproject.DefinitionFiles.SingleFile` | `slproject.DefinitionFiles.MultiFile`

Definition file type, specified as `slproject.DefinitionFiles.SingleFile`, `slproject.DefinitionFiles.MultiFile`, or `slproject.DefinitionFiles.FixedPathMultiFile`. Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. `MultiFile` is better for avoiding merging issues on shared projects. `SingleFile` is faster but is likely to cause merge issues when two users submit changes in the same project to a source control tool. If you need to work with long file paths, use `FixedPathMultiFile`.

Example: `export(proj,'proj.zip',slproject.DefinitionFiles.SingleFile)`
Compatibility Considerations

Simulink project API is not recommended

Not recommended starting in R2019a

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

“Archive Projects”

Introduced in R2013a
**findCategory**

(Not recommended) Get project category of labels

**Note**  ```simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
category = findCategory(proj, categoryName)
```  

**Description**

`category = findCategory(proj, categoryName)` returns the project category specified by `categoryName`. You need to get a category before you can use `createLabel` or `removeLabel`.

**Examples**

**Get a Category of Project Labels**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findCategory` to get a category of labels by name.

```matlab
category = findCategory(proj, 'Classification')
category =

Category with properties:

Name: 'Classification'
```
Alternatively, you can examine categories by index. Get the first category.

proj.Categories(1)

ans =

    Category with properties:

        Name: 'Classification'
        DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]

Find out what you can do with the category.

methods(category)

Methods for class slproject.Category:

createLabel    findLabel    removeLabel

**Input Arguments**

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

categoryName — Name of category
character vector

Name of the category to get, specified as a character vector.

**Output Arguments**

category — Category of labels
category object
Category of labels, returned as a category object that you can query or modify. If the specified category is not found, the function returns an empty array.

### Compatibility Considerations

#### Simulink project API is not recommended

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

- `simulinkproject`

**Introduced in R2013a**
**findFile**

(Not recommended) Get project file by name

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
file = findFile(proj,fileorfolder)
```

**Description**

`file = findFile(proj,fileorfolder)` returns a specific project file by name. You need to get a file before you can query labels, or use `addLabel` or `removeLabel`.

**Examples**

**Find a File By Name**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Use `findFile` to get a file by name. You need to know the path if it is inside subfolders under the project root.

```matlab
myfile = findFile(proj,'models/AnalogControl.slx')
```

```matlab
myfile =
    ProjectFile with properties:
      Path: [1x86 char]
```
Alternatively, you can examine files by index. Get the first file.

```matlab
file = proj.Files(1);
```

Find out what you can do with the file.

```matlab
methods(file)
```

Methods for class `slproject.ProjectFile`:

- `addLabel`
- `removeLabel`
- `findLabel`

### Input Arguments

**proj** — Project

*project*

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

**fileorfolder** — Path of file or folder

*character vector | cell array of character vectors | string array*

Path of the file or folder to find relative to the project root folder, specified as a character vector, string, or array. Files must include any subfolders under the project root and the file extension. The file or folder must be within the root folder.

Example: `‘models/myModelName.slx’`

### Output Arguments

**file** — Project file

*file object*

Project file, returned as a file object that you can query or modify.
Compatibility Considerations

Simulink project API is not recommended
*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

**Functions**
`addLabel` | `findCategory` | `findLabel` | `removeLabel` | `simulinkproject`

**Introduced in R2013a**
findLabel

(Not recommended) Get project file label

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
label = findLabel(file, categoryName, labelName)
label = findLabel(file, labelDefinition)
label = findLabel(category, labelName)
```

**Description**

- `label = findLabel(file, categoryName, labelName)` returns the label and its attached data for the label `labelName` in the category `categoryName` that is attached to the specified file or files. Use this syntax when you know the label name and category.

- `label = findLabel(file, labelDefinition)` returns the file label and its attached data for the label name and category specified by `labelDefinition`. Use this syntax if you previously got a `labelDefinition` by accessing a `Labels` property, e.g., using a command like `myfile.Labels(1)`.

- `label = findLabel(category, labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

**Examples**

**Find Files with the Label Utility**

Find all project files with a particular label.

Open the airframe project and create a project object.
sldemo_slproject_airframe;
proj = simulinkproject;

Get the list of project files.

files = proj.Files;

Loop through each file. If the file has the extension .m, attach the label Utility.

for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension,'.m')
        addLabel(file,'Classification','Utility');
    end
end

Find all the files with the label Utility and add them to a list returned in utility_files_to_review.

utility_files_to_review = {};
for jj=1:numel(files)
    this_file = files(jj);
    label = findLabel(this_file,'Classification','Utility');

    if ( ~isempty(label))
        % This is a file labeled 'Utility'. Add to the % list of utility files.
        utility_files_to_review = [utility_files_to_review; this_file];
    end
end

**Find a Label by Name or Definition**

Open the airframe project and create a project object.

sldemo_slproject_airframe;
proj = simulinkproject;

Get a particular file by name.

myfile = findFile(proj,'models/AnalogControl.slx');
Get a label by name.

```matlab
label = findLabel(myfile,'Classification','Design');
```

Alternatively, examine the `Labels` property of the file to get an array of Label objects, one for each label attached to the file.

```matlab
labels = myfile.Labels
```

Index into the `Labels` property to get the label attached to the particular file.

```matlab
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the `Labels` property, you can use it with `findLabel`.

```matlab
label = findLabel(myfile,labeldefinition);
```

### Find Labels by Name or Definition

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a category.

```matlab
category = proj.Categories(1)
category =
```

```matlab
Category with properties:
```
```matlab
    Name: 'Classification'
    DataType: 'none'
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Get a label definition.

```matlab
ld = findLabel(category,'Design')
ld =
```
```matlab
LabelDefinition with properties:
```
Name: 'Design'
CategoryName: 'Classification'

Input Arguments

file — File to search labels of
file object

File to search the labels of, specified as a file object or an array of file objects. You can get the file object by examining the project's Files property (proj.Files), or use findFile to get a file by name. The file must be in the project.

categoryName — Name of category
character vector

Name of the parent category for the label, specified as a character vector.

labelName — Name of label
character vector

Name of the label to get, specified as a character vector.

labelDefinition — Name of label
label definition object

Name of the label to get, specified as a label definition object returned by the file.Label property.

category — Category of labels
category object

Category of labels, specified as a category object. Get a category object from the proj.Categories property or by using findCategory.

Output Arguments

label — Label
label object
Label, returned as a label object.

**Functions**

`addLabel` | `createLabel` | `findFile` | `simulinkproject`

**Introduced in R2013a**
find_mdlrefs

Find Model blocks and referenced models at all levels or at top level only

Syntax

[refMdls,mdlBlks] = find_mdlrefs(system)
[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value)
[refMdls,mdlBlks] = find_mdlrefs(system,allLevels)

Description

[refMdls,mdlBlks] = find_mdlrefs(system) finds all referenced models and Model blocks contained by the subsystem or model hierarchy that system is the top level of.

[refMdls,mdlBlks] = find_mdlrefs(system,Name,Value) finds referenced models and Model blocks with additional options specified by one or more Name,Value pair arguments.

[refMdls,mdlBlks] = find_mdlrefs(system,allLevels) specifies the levels of the system to search.

Tip The find_mdlrefs function provides two different ways to specify the levels of the system to search. Both techniques give the same results, but only the name and value technique allows you to control inclusion of protected models in refMdls.

Examples

Find Referenced Models in Model Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model.
load_system('sldemo_mdlref_basic');
[myModels,myModelBlks] = find_mdlrefs('sldemo_mdlref_basic')

myModels = 2x1 cell array
    {'sldemo_mdlref_counter'}
    {'sldemo_mdlref_basic'}

myModelBlks = 3x1 cell array
    {'sldemo_mdlref_basic/CounterA'}
    {'sldemo_mdlref_basic/CounterB'}
    {'sldemo_mdlref_basic/CounterC'}

Input Arguments

system — System to search
character vector | handle

System to search, specified as a character vector or a handle.

• The character vector can be the path to a Model block, subsystem, or a model in a model hierarchy.
• The handle can be for a Model block, subsystem, or model in a model hierarchy.

allLevels — Levels to search
true (default) | false

Levels to search, specified as true or false.

• true — Search all Model blocks in the model hierarchy for which the system is the top model.
• false — Search only the top-level system.

Data Types: logical

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes.
You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: refModels = find_mdlrefs(top_model,'IncludeProtectedModels',true)

**AllLevels — Levels to search**
true (default) | false

Levels to search, specified as a true or false.

- **true** — Search all Model blocks in the model hierarchy for which the system is the top model.
- **false** — Search only the top-level system.

Data Types: logical

**IncludeProtectedModels — Include protected models in search results**
false (default) | true

Include protected models in search, specified as true or false. This setting does not affect the list of Model blocks returned.

Data Types: logical

**Variants — Include variant models in search**
'ActivePlusCodeVariants' (default) | 'ActiveVariants' | 'AllVariants'

Include variant models in search, specified as 'ActivePlusCodeVariants', 'ActiveVariants', or 'AllVariants'.

- **'ActivePlusCodeVariants'** — Include all variant models in Variant Subsystem blocks for which you select the Analyze all choices during update diagram and generate preprocessor conditionals option.
- **'ActiveVariants'** — Include active variant models for Variant Subsystem blocks.
- **'AllVariants'** — Include all variant models in Variant Subsystem blocks.

**IncludeCommented — Include commented blocks in search**
false (default) | true

Include commented blocks in search, specified as false or true.

Data Types: logical
Keep Models Loaded — Keep loaded models that function loads
false (default) | true

The `find_mdlrefs` function loads the models in the model hierarchy of the model that you specify. By default, the function closes those models, except for models that were already loaded before execution of the function. To keep all the models loaded that the function loads, set this argument to `true`.

Data Types: logical

Output Arguments

`refMdlS` — Names of referenced models
cell array of character vectors

Names of referenced models, returned as a cell array of character vectors. The last element is the system you specified in the `system` input argument or the parent model of that system.

`mdlBlks` — Names of Model blocks
cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Topics

“Model Reference Basics”
“Inspect Model Hierarchies”
“Reference Protected Models from Third Parties”

Introduced before R2006a
**find_system**

Find systems, blocks, lines, ports, and annotations

**Syntax**

Objects = find_system
Objects = find_system(System)
Objects = find_system(Name,Value)
Objects = find_system(System,Name,Value)

**Description**

Objects = find_system returns loaded systems and their blocks, including subsystems.

Objects = find_system(System) returns the specified system and its blocks.

Objects = find_system(Name,Value) returns loaded systems and the objects in those systems that meet the criteria specified by one or more Name,Value pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

Objects = find_system(System,Name,Value) returns the objects in the specified system that meet the specified criteria.

**Examples**

**Find Loaded Systems and Their Blocks**

Return the names of all loaded systems and their blocks.

```matlab
load_system('vdp')
find_system
```
Returns loaded systems and libraries, including vdp.

**Find Specific System and Its Blocks**

Return vdp system and its blocks.

```matlab
load_system({'vdp','fuelsys'})
find_system('vdp')
```

ans = 13x1 cell array

```
{'vdp'    }
n{'vdp/Fcn' }
n{'vdp/More Info' }
n{'vdp/More Info/Model Info'}
n{'vdp/Mu'  }
n{'vdp/Mux' }
n{'vdp/Product' }
n{'vdp/Scope' }
n{'vdp/Sum'  }
n{'vdp/x1'  }
n{'vdp/x2'  }
n{'vdp/Out1' }
n{'vdp/Out2' }
```
**Return Names of Loaded Models**

Return the names of only the loaded models, i.e., block diagrams. This command returns library names as well, because libraries are treated as models.

```matlab
load_system('vdp');
open_bd = find_system('type','block_diagram')
```

```matlab
open_bd = 1x1 cell array
    {'vdp'}
```

**Search Children of Subsystem**

Return the names of all Goto blocks that are children of the Unlocked subsystem in the `sldemo_clutch` system.

```matlab
load_system('sldemo_clutch');
find_system('sldemo_clutch/Unlocked','SearchDepth',1,'BlockType','Goto')
```

```matlab
ans = 2x1 cell array
    {'sldemo_clutch/Unlocked/Goto' }
    {'sldemo_clutch/Unlocked/Goto1'}
```

**Search Using Multiple Criteria**

Search in the `vdp` system and return the names of all Gain blocks whose Gain value is set to 1.

```matlab
load_system('vdp');
find_system('vdp','BlockType','Gain','Gain','1')
```

```matlab
ans = 1x1 cell array
    {'vdp/Mu'}
```
**Return Lines and Annotations as Handles**

Get the handles of all lines and annotations in the vdp system. With 'FindAll', the function returns handles regardless of how you specify the system to search.

```matlab
load_system('vdp');
L = find_system('vdp','FindAll','on','type','line')
L = 17×1
  30.0042  
  29.0042  
  28.0042  
  27.0042  
  26.0042  
  25.0042  
  24.0042  
  23.0042  
  22.0042  
  21.0042  
  ...  

A = find_system('vdp','FindAll','on','type','annotation')
A = 2×1
  32.0042  
  31.0042
```

**Search for Specific Block Parameter Value**

Find any block dialog box parameters with a value of 0 in the vdp and fuelsys systems.

```matlab
load_system({'vdp','fuelsys'})
find_system({'vdp','fuelsys'},'BlockDialogParams','0')
ans =
  'vdp/x2'
  'vdp/Out1'
  'vdp/Out2'
  'fuelsys/BlockDialogParams1'
  'fuelsys/BlockDialogParams2'
```

2-297
Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog parameter value that starts with 3.

```matlab
load_system({'fuelsys','vdp'});
find_system('SearchDepth','1','regexp','on','BlockDialogParams','^3')
```

```matlab
ans = 3x1 cell array
    {'vdp/Scope'
    {'vdp/Scope'
    {'fuelsys/Nominal...'
```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector you want to match to return all objects that contain that character vector. Find all the import and output blocks in the `sldemo_clutch` model.

```matlab
load_system('sldemo_clutch');
find_system('sldemo_clutch','regexp','on','blocktype','port')
```

```matlab
ans = 39x1 cell array
    {'sldemo_clutch/Friction...'                           }
    {'sldemo_clutch/Friction...'                           }
    {'sldemo_clutch/Friction...'                           }
    {'sldemo_clutch/Friction Mode Logic/Tin'                }
    {'sldemo_clutch/Friction Mode Logic/Tfmaxs'             }
```
Update Library Links in a Subsystem

In this example, myModel contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use find_system with 'FollowLinks' set to 'off'. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```matlab
open_system('myModel')
find_system(bdroot,'LookUnderMasks','on','FollowLinks', 'off')
```
Use `find_system` with 'FollowLinks' set to 'on'. `find_system` updates the library links and returns the block in the subsystem.

```matlab
find_system(bdroot,'LookUnderMasks','on','FollowLinks','on')
```

Updating Link: myModel/Subsystem/Gain
Updating Link: myModel/Subsystem/Gain

```matlab
ans =
    'myModel'
    'myModel/Subsystem'
    'myModel/Subsystem/Gain'
```

### Return Values as Handles

Provide the system to `find_system` as a handle. Search for block dialog box parameters with a value of 0. If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```matlab
load_system('vdp');
sys = get_param('vdp','Handle');
find_system(sys,'BlockDialogParams','0')
```

```matlab
ans = 8×1
     3.0001
     4.0001
     8.0001
    11.0001
    12.0001
    12.0001
    13.0001
    13.0001
```
**Input Arguments**

**System — System to search**
- path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: 'MyModel/Subsystem1'
Example: {'vdp','fuelsys'}

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1,** **Value1,** ..., **NameN,** **ValueN**.

When you use the `find_system` function, **Name,** **Value** pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See “Model Parameters” on page 6-2 and “Block-Specific Parameters” on page 6-132 for the lists of model and block parameters.

Example: 'SearchDepth', '0', 'LookUnderMasks', 'none', 'BlockType', 'Goto' searches in loaded systems, excluding masked subsystems, for Goto blocks.

**BlockDialogParams — Option to search block dialog box parameters for the specified value**
- character vector | string scalar

Option to search block dialog box parameters for the specified value, specified as the comma-separated pair consisting of 'BlockDialogParams' and a character vector or string scalar. This pair must follow the other search constraint pairs.

**CaseSensitive — Option to consider case when matching**
- 'on' (default) | 'off'

Option to consider case when matching, specified as the comma-separated pair consisting of 'CaseSensitive' and 'on' for case-sensitive searching or 'off'.
FindAll — Option to include lines, ports, and annotations within systems

'off' (default) | 'on'

Option to include lines, ports, and annotations in systems in the search, specified as the comma-separated pair consisting of 'FindAll' and 'on' or 'off'. When this option is set to 'on', find_system returns a vector of handles regardless of how you specify the System argument.

FirstResultOnly — Option to return only the first result

'off' (default) | 'on'

Option to return only the first result and then stop the search, specified as the comma-separated pair consisting of 'FirstResultOnly' and 'on' or 'off'.

DiveInsideSubsystemReference — Option to dive inside a referenced subsystem

'off' (default) | 'on'

Option to dive inside a referenced subsystem in a model and list child blocks specified as the comma-separated pair consisting of 'DiveInsideSubsystemReference' and 'on' or 'off'.

FollowLinks — Option to follow links into library blocks

'off' (default) | 'on'

Option to follow links into library blocks, specified as the comma-separated pair consisting of 'FollowLinks' and 'on' or 'off'. If you do not specify a system to search, find_system includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See “Update Library Links in a Subsystem” on page 2-299.

IncludeCommented — Option to include commented blocks

'off' (default) | 'on'

Option to include commented blocks in the search, specified as the comma-separated pair consisting of 'IncludeCommented' and 'on' or 'off'.

LoadFullyIfNeeded — Option to load any partially loaded models

'off' (default) | 'on'
Option to load any partially loaded models, specified as the comma-separated pair of 'LoadFullyIfNeeded' and 'on' to load models or 'off' to disable loading. Use this option, for example, to prevent load warnings.

**LookUnderMasks — Options for searching under masks**
'graphical' (default) | 'none' | 'functional' | 'all' | 'on' | 'off'

Options for searching under masks, specified as the comma-separated pair consisting of 'LookUnderMasks' and one of these options:

- 'graphical' — Search includes masked subsystems that have no workspaces and no dialogs.
- 'none' — Search skips masked subsystems.
- 'functional' — Search includes masked subsystems that do not have dialogs.
- 'all' — Search includes all masked subsystems.
- 'on' — Search includes all masked subsystems.
- 'off' — Search skips masked subsystem.

**RegExp — Option to treat search expressions as regular expressions**
'off' (default) | 'on'

Option to treat search expressions as regular expressions specified as the comma-separated pair consisting of 'RegExp' and 'on' to treat search expressions as regular expressions or 'off'. To learn more about MATLAB regular expressions, see "Regular Expressions" (MATLAB).

**'SearchDepth — Option to restrict the search depth**
positive integer character vector or string scalar

Option to restrict the search depth to the specified level, specified as the comma-separated pair consisting of 'SearchDepth' and a positive integer character vector or string scalar. For example, specify '0' to search loaded systems only, '1' for blocks and subsystems of the top-level system, '2' for the top-level system and its children, etc. The default is to search all levels.

**Variants — Options for searching variants**
'ActiveVariants' (default) | 'AllVariants' | 'ActivePlusCodeVariants'

Options for searching variants, specified as the comma-separated pair consisting of 'Variants' and one of these options:
• 'ActiveVariants' — Search in only the active variant subsystems.
• 'AllVariants' — Search in all variants.
• 'ActivePlusCodeVariants' — Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.

This search constraint applies only to variant subsystems and model variants.

**Output Arguments**

**Objects — Matching objects**
cell array of path names | vector of handles

Matching objects found, returned as:

• A cell array of path names if you specified System as a path name or cell array of path names, or if you did not specify a system
• A vector of handles if you specified System as a handle or vector of handles

fixdt

Create Simulink.NumericType object describing fixed-point or floating-point data type

Syntax

a = fixdt(Signed, WordLength)
a = fixdt(Signed, WordLength, FractionLength)
a = fixdt(Signed, WordLength, TotalSlope, Bias)
a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent, Bias)
a = fixdt(DataTypeNameString)
a = fixdt(..., 'DataTypeOverride', 'Off')
[DataType,IsScaledDouble] = fixdt(DataTypeNameString)
[DataType,IsScaledDouble] = fixdt(DataTypeNameString,
'DataTypeOverride', 'Off')

Description

a = fixdt(Signed, WordLength) returns a Simulink.NumericType object describing a fixed-point data type with unspecified scaling. The scaling would typically be determined by another block parameter. Signed can be 0 (false) for unsigned or 1 (true) for signed.

a = fixdt(Signed, WordLength, FractionLength) returns a Simulink.NumericType object describing a fixed-point data type with binary point scaling. FractionLength can be greater than WordLength. For more information, see “Binary Point Interpretation” (Fixed-Point Designer).

a = fixdt(Signed, WordLength, TotalSlope, Bias) or a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent, Bias) returns a Simulink.NumericType object describing a fixed-point data type with slope and bias scaling.

a = fixdt(DataTypeNameString) returns a Simulink.NumericType object describing an integer, fixed-point, or floating-point data type specified by a data type
name. The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the Fixed-Point Designer product. For more information, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).

\[
a = \text{fixdt}(..., 'DataTypeOverride', 'Off')
\]
returns a Simulink.NumericType object with its DataTypeOverride parameter set to Off. The default value for this property is Inherit. You can specify the DataTypeOverride parameter after any combination of other input parameters.

\[
[\text{DataType}, \text{IsScaledDouble}] = \text{fixdt}(\text{DataTypeNameString})
\]
returns a Simulink.NumericType object describing an integer, fixed-point, or floating-point data type specified by a data type name and a flag that indicates whether the specified data type name was the name of a scaled double data type.

\[
[\text{DataType}, \text{IsScaledDouble}] = \text{fixdt}(\text{DataTypeNameString}, '\text{DataTypeOverride}', 'Off')
\]
returns:

- A Simulink.NumericType object describing an integer, fixed-point, or floating-point data type specified by a data type name. The DataTypeOverride parameter of the Simulink.NumericType object is set to Off.
- A flag that indicates whether the specified data type name was the name of a scaled double data type.

### Examples

Return a Simulink.NumericType object describing a fixed-point data type with unspecified scaling:

\[
a = \text{fixdt}(1,16)
\]

\[
a = \\
\text{Simulink.NumericType}\n\begin{align*}
\text{DataTypeMode:} & \quad '\text{Fixed-point: unspecified scaling}' \\
\text{Signedness:} & \quad '\text{Signed}' \\
\text{WordLength:} & \quad 16 \\
\text{IsAlias:} & \quad \text{false} \\
\text{HeaderFile:} & \quad '' \\
\text{Description:} & \quad ''
\end{align*}
\]
Return a Simulink.NumericType object describing a fixed-point data type with binary point scaling:

```matlab
a = fixdt(1,16,2)
a =
```

Simulink.NumericType
  DataTypeMode: 'Fixed-point: binary point scaling'
  Signedness: 'Signed'
  WordLength: 16
  FractionLength: 2
  IsAlias: false
  HeaderFile: ''
  Description: ''

Return a Simulink.NumericType object describing a fixed-point data type with slope and bias scaling:

```matlab
a = fixdt(1, 16, 2^-2, 4)
a =
```

Simulink.NumericType
  DataTypeMode: 'Fixed-point: slope and bias scaling'
  Signedness: 'Signed'
  WordLength: 16
  Slope: 0.25
  Bias: 4
  IsAlias: false
  HeaderFile: ''
  Description: ''

Return a Simulink.NumericType object describing an integer, fixed-point, or floating-point data type specified by a data type name:

```matlab
[DataType,IsScaledDouble] = fixdt('ufix8')
```

```
DataType =
```

Simulink.NumericType
  DataTypeMode: 'Fixed-point: binary point scaling'
  Signedness: 'Unsigned'
  WordLength: 8
  FractionLength: 0
Return a Simulink.NumericType object with its DataTypeOverride property set to Off:

```matlab
a = fixdt(0, 8, 2, 'DataTypeOverride', 'Off')
```

```matlab
a =
```

Simulink.NumericType

- **DataTypeMode**: 'Fixed-point: binary point scaling'
- **Signedness**: 'Unsigned'
- **WordLength**: 8
- **FractionLength**: 2
- **DataTypeOverride**: Off
- **IsAlias**: false
- **HeaderFile**: ''
- **Description**: ''

**Topics**

“Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer)

**Introduced before R2006a**
**fixpt_evenspace_cleanup**

Modify breakpoints of lookup table to have even spacing.

**Syntax**

\[ xdata\_modified = fixpt\_evenspace\_cleanup(xdata,xdt,xscale) \]

**Description**

\( xdata\_modified = fixpt\_evenspace\_cleanup(xdata,xdt,xscale) \) modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

\( xdata \) is the breakpoint vector of a lookup table to make evenly spaced, such as \( 0:0.005:1 \). \( xdt \) is the data type of the breakpoints, such as \( \text{sfix}(16) \). \( xscale \) is the scaling of the breakpoints, such as \( 2^{-12} \). Using these three inputs, \( \text{fixpt\_evenspace\_cleanup} \) returns the modified breakpoints in \( xdata\_modified \).

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector \([0 \ 2 \ 5]\), which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the \( \text{fixpt\_evenspace\_cleanup} \) function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

**Examples**

Modify breakpoints of a lookup table to have even spacing after quantization:
xdata = 0:0.005:1;
xdt = sfix(16);
xscale = 2^-12;
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)

Introduced before R2006a
fixpt_interp1

Implement 1-D lookup table

Syntax

\[ y = \text{fixpt_interp1}(xdata, ydata, x, xdt, xscale, ydt, yscale, rndmeth) \]

Description

\[ y = \text{fixpt_interp1}(xdata, ydata, x, xdt, xscale, ydt, yscale, rndmeth) \]

implements a one-dimensional lookup table to find output \( y \) for input \( x \). If \( x \) falls between two \( xdata \) values (breakpoints), \( y \) is the result of interpolating between the corresponding \( ydata \) values. If \( x \) is greater than the maximum value in \( xdata \), \( y \) is the maximum \( ydata \) value. If \( x \) is less than the minimum value in \( xdata \), \( y \) is the minimum \( ydata \) value.

If the input data type \( xdt \) or the output data type \( ydt \) is floating point, \text{fixpt_interp1} performs the interpolation using floating-point calculations. Otherwise, \text{fixpt_interp1} uses integer-only calculations. These calculations handle the input scaling \( xscale \) and the output scaling \( yscale \) and obey the rounding method \( rndmeth \).

Input Arguments

\textit{xdata}

Vector of breakpoints for the lookup table, such as \( \text{linspace}(0,8,33) \).

\textit{ydata}

Vector of table data that correspond to the breakpoints for the lookup table, such as \( \text{sin}(xdata) \).

\textit{x}

Vector of input values for the lookup table to process, such as \( \text{linspace}(-1,9,201) \).
xdt
Data type of input x, such as sfix(8).

xscale
Scaling for input x, such as 2^-3.

ydt
Data type of output y, such as sfix(16).

yscale
Scaling for output y, such as 2^-14.

rndmeth
Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'    Round to the nearest representable number in the direction of positive infinity.
'Floor' (default) Round to the nearest representable number in the direction of negative infinity.
'Nearest'    Round to the nearest representable number.
'Toward Zero' Round to the nearest representable number in the direction of zero.

Examples
Interpolate outputs for x using a 1-D lookup table that approximates the sine function:

```matlab
xdata = linspace(0,8,33).';
ydata = sin(xdata);
% Define input x as a vector of 201 evenly spaced points between -1 and 9 (includes values both lower and higher than the range of breakpoints in xdata)
x = linspace(-1,9,201).';
% Interpolate output values for x
```
y = fixpt_interp1(xdata,ydata,x,sfix(8),2^-3,sfix(16),...
  2^-14,'Floor')

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \\ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},\text{errmax},\text{nptsmax})
\]
\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},\text{errmax},[]) \]
\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},[],\text{nptsmax})
\]
\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt}y_{dt},y_{scale},\text{rndmeth},\text{errmax},\text{nptsmax},\text{spacing})
\]

Description

\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},\text{errmax},\text{nptsmax}) \]
\text{returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.}

\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},\text{errmax},[]) \]
\text{returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.}

\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt},y_{scale},\text{rndmeth},[],\text{nptsmax}) \]
\text{returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.}

\[
[xdata,ydata,erworst] = \text{fixpt\_look1\_func\_approx}(\text{func}',... \\\ \\\ \\ \ x_{min},x_{max},x_{dt},x_{scale},y_{dt}y_{dt},y_{scale},\text{rndmeth},\text{errmax},\text{nptsmax},\text{spacing})
\]
fixpt_look1_func_approx

\( \text{xmin, xmax, xdt, xscale, ydtydt, yscale, rndmeth, errmax, nptsmax, spacing} \)
returns the optimal breakpoints of a lookup table, an ideal function applied to the
breakpoints, and the worst-case approximation error. The lookup table satisfies the
maximum acceptable error, maximum number of points, and breakpoint spacing that you
specify.

In each case, fixpt_look1_func_approx interpolates between lookup table data points
to optimize the fixed-point approximation. The inputs \( \text{xmin} \) and \( \text{xmax} \) specify the range
over which to approximate the breakpoints. The inputs \( \text{xdt, xscale, ydt, yscale} \), and
rndmeth follow conventions used by fixed-point Simulink blocks.

The inputs \( \text{errmax, nptsmax} \), and \( \text{spacing} \) are optional. Of these inputs, you must
specify at least \( \text{errmax} \) or \( \text{nptsmax} \). If you omit one of those two inputs, you must use
brackets, [], in place of the omitted input. fixpt_look1_func_approx ignores that
requirement for the lookup table.

If you do not specify spacing, and more than one spacing satisfies \( \text{errmax} \) and \( \text{nptsmax} \),
fixpt_look1_func_approx chooses in this order: power-of-2 spacing, even spacing,
uneven spacing. This behavior applies when you specify both \( \text{errmax} \) and \( \text{nptsmax} \), but
not when you specify just one of the two.

**Input Arguments**

**func**

Function of x for which to approximate breakpoints. Enclose this expression in single
quotes, for example, 'sin(2*pi*x)'.

**xmin**

Minimum value of x.

**xmax**

Maximum value of x.

**xdt**

Data type of x.
**xscale**
Scaling for the x values.

**ydt**
Data type of y.

**yscale**
Scaling for the y values.

**rndmeth**
Rounding mode supported by fixed-point Simulink blocks:

- 'Ceiling' Round to the nearest representable number in the direction of positive infinity.
- 'Floor' (default) Round to the nearest representable number in the direction of negative infinity.
- 'Nearest' Round to the nearest representable number.
- 'Toward Zero' Round to the nearest representable number in the direction of zero.

**errmax**
Maximum acceptable error between the ideal function and the approximation given by the lookup table.

**nptsmax**
Maximum number of points for the lookup table.

**spacing**
Spacing of breakpoints for the lookup table:

- 'even' Even spacing
- 'pow2' Even, power-of-2 spacing
- 'unrestricted' (default) Uneven spacing
If you specify...

<table>
<thead>
<tr>
<th>The breakpoints of the lookup table...</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{errmax} and \textit{nptsmax}</td>
</tr>
<tr>
<td>Meet both criteria, if possible.</td>
</tr>
<tr>
<td>The \textit{errmax} requirement has higher priority than \textit{nptsmax}. If the breakpoints cannot meet both criteria with the specified spacing, \textit{nptsmax} does not apply.</td>
</tr>
<tr>
<td>\textit{errmax} only</td>
</tr>
<tr>
<td>Meet the error criteria, and fixpt_look1_func_approx returns the fewest number of points.</td>
</tr>
<tr>
<td>\textit{nptsmax} only</td>
</tr>
<tr>
<td>Meet the points criteria, and fixpt_look1_func_approx returns the smallest worst-case error.</td>
</tr>
</tbody>
</table>

### Output Arguments

**xdata**

Vector of breakpoints for the lookup table.

**ydata**

Vector of values from applying the ideal function to the breakpoints.

**errworst**

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

### Examples

Approximate a fixed-point sine function using a lookup table:

```matlab
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
```
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);

See Also
fixpt_evenspace_cleanup | fixpt_interp1 | fixpt_look1_func_plot

Topics
“Producing Lookup Table Data” (Fixed-Point Designer)
“Use Lookup Table Approximation Functions” (Fixed-Point Designer)

Introduced before R2006a
fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)  
errworst = fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)

Description

fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth) plots a lookup table approximation  
function and the error from the ideal function.

errworst = fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth) plots a lookup table approximation  
function and the error from the ideal function. The output errworst is the maximum  
absolute error.

You can use fixpt_look1_func_approx to generate xdata and ydata, the  
breakpoints and table data for the lookup table, respectively.  
fixpt_look1_func_approx applies the ideal function to the breakpoints in xdata to  
produce ydata. While this method is the easiest way to generate ydata, you can choose  
other values for ydata as input for fixpt_look1_func_plot. Choosing different values  
for ydata can, in some cases, produce a lookup table with a smaller maximum absolute  
error.

Input Arguments

xdata

Vector of breakpoints for the lookup table.
**ydata**
Vector of values from applying the ideal function to the breakpoints.

**func**
Function of \( x \) for which to approximate breakpoints. Enclose this expression in single quotes, for example, \( '\sin(2*\pi*x)' \).

**xmin**
Minimum value of \( x \).

**xmax**
Maximum value of \( x \).

**xdt**
Data type of \( x \).

**xscale**
Scaling for the \( x \) values.

**ydt**
Data type of \( y \).

**yscale**
Scaling for the \( y \) values.

**rndmeth**
Rounding mode supported by fixed-point Simulink blocks:

- **'Ceiling'**
  Round to the nearest representable number in the direction of positive infinity.

- **'Floor'** (default)
  Round to the nearest representable number in the direction of negative infinity.

- **'Nearest'**
  Round to the nearest representable number.
'Towards Zero'
Round to the nearest representable number in the direction of zero.

Examples
Plot a fixed-point approximation of the sine function using data points generated by fixpt_look1_func_approx:

```matlab
func = 'sin(2*pi*x)';
x = linspace(0, 0.25, 256);
x = [x -eps(x); x +eps(x)];

% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;

% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;

% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;

% Specify the rounding method
rndmeth = 'Floor';

% Define the maximum acceptable error
errmax = 2^-10;

% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';

% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
    xdt,xscale,ydt,yscale,rndmeth);
```

fixpt_look1_func_plot plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.
The lookup table requires 33 points to achieve a maximum absolute error of $2^{-11.3922}$.

“Producing Lookup Table Data” (Fixed-Point Designer)
“Use Lookup Table Approximation Functions” (Fixed-Point Designer)
Introduced before R2006a
fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)

Description

fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue) sets the property fixptPropertyName of every applicable block in the model or subsystem SystemName to the value fixptPropertyValue

Examples

Set each fixed-point block in a model Filter_1 to round towards the floor and saturate upon overflow:

% Round towards the floor
fixpt_set_all('Filter_1', 'RndMeth', 'Floor')

% Saturate upon overflow
fixpt_set_all('Filter_1', 'DoSatur', 'on')

Introduced before R2006a
**fixptbestexp**

Exponent that gives best precision for fixed-point representation of value

**Syntax**

```plaintext
out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)
out = fixptbestexp(RealWorldValue, FixPtDataType)
```

**Description**

`out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)` returns the exponent that gives the best precision for the fixed-point representation of `RealWorldValue`. `TotalBits` specifies the number of bits for the fixed-point number. `IsSigned` specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

`out = fixptbestexp(RealWorldValue, FixPtDataType)` returns the exponent that gives the best precision based on the data type `FixPtDataType`.

**Examples**

Get the exponent that gives the best precision for the real-world value 4/3 using a signed, 16-bit number:

```plaintext
out = fixptbestexp(4/3,16,1)
out =
-14
```

Alternatively, specify the fixed-point data type:

```plaintext
out = fixptbestexp(4/3,sfix(16))
out =
-14
```
This shows that the maximum precision representation of 4/3 is obtained by placing 14 bits to the right of the binary point:

01.01010101010101

You can specify the precision of this representation in fixed-point blocks by setting the scaling to $2^{-14}$ or $2^{\text{fixptbestexp}(4/3,16,1)}$.

**See Also**

fixptbestprec

**Introduced before R2006a**
**fixptbestprec**

Determine maximum precision available for fixed-point representation of value

**Syntax**

```
out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)
out = fixptbestprec(RealWorldValue,FixPtDataType)
```

**Description**

`out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed-point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is 1, the number is signed. If `IsSigned` is 0, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue,FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

**Examples**

**Example 1**

The following command returns the maximum precision available for the real-world value 4/3 using a signed, 8-bit number:

```
out = fixptbestprec(4/3,8,1)
```

```
out = 0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))
```
out =  
0.015625

This value means that the maximum precision available for 4/3 is obtained by placing six bits to the right of the binary point since \(2^{-6}\) equals 0.015625:

01.010101

**Example 2**

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```matlab
knownMax = 22;
knownMin = -13;
localSafetyMargin = 30;
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ... 
    [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp` in the Fixed-Point Designer documentation.

**See Also**

`fixptbestexp`

**Introduced before R2006a**
**float**

Create Simulink.NumericType object describing floating-point data type

**Syntax**

```matlab
a = float('single')
a = float('double')
```

**Description**

`a = float('single')` returns a Simulink.NumericType object that describes the data type of an IEEE single (32 total bits, 8 exponent bits).

`a = float('double')` returns a Simulink.NumericType object that describes the data type of an IEEE double (64 total bits, 11 exponent bits).

**Note** float is a legacy function. In new code, use fixdt instead. In existing code, replace `float('single')` with `fixdt('single')` and `float('double')` with `fixdt('double')`.

**Examples**

Define an IEEE single data type.

```matlab
>> a = float('single')
a =

NumericType with properties:

    DataTypeMode: 'Single'
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```
See Also
Simulink.NumericType | fixdt | sfix | sfrac | sint | ufix | ufrac | uint

Introduced before R2006a
frameedit

Edit print frames for Simulink and Stateflow block diagrams

Syntax

frameedit
frameedit filename

Description

frameedit starts the PrintFrame Editor, a graphical user interface you use to create borders for Simulink and Stateflow block diagrams. With no argument, frameedit opens the PrintFrame Editor window with a new file.

frameedit filename opens the PrintFrame Editor window with the specified filename, where filename is a figure file (.fig) previously created and saved using frameedit.

Tips

This illustrates the main features of the PrintFrame Editor.
Closing the PrintFrame Editor

To close the PrintFrame Editor window, click the close box in the upper right corner, or select Close from the File menu.

Printing Simulink Block Diagrams with Print Frames

Select Print from the Simulink File menu. Check the Frame box and supply the filename for the print frame you want to use. Click OK in the Print dialog box.
Getting Help for the PrintFrame Editor

For further instructions on using the PrintFrame Editor, select PrintFrame Editor Help from the Help menu in the PrintFrame Editor.

Introduced in R2008b
**fxptdlg**

Start Fixed-Point Tool

**Syntax**

`fxptdlg('modelname')`

**Description**

`fxptdlg('modelname')` starts the Fixed-Point Tool for the Simulink model specified by `modelname`. You can also access this tool by the following methods:

- From the **Apps** tab, under **Code Generation** click **Fixed-Point Tool**.
- From a subsystem context (right-click) menu, select **Fixed-Point Tool**.

In conjunction with Fixed-Point Designer software, the Fixed-Point Tool provides convenient access to:

- Model and subsystem parameters that control the signal logging, fixed-point instrumentation mode, and data type override. (see “Model Parameters” on page 6-2)
- Plotting capabilities that enable you to plot data that resides in the MATLAB workspace, namely, simulation results associated with Scope, To Workspace, and root-level Outport blocks, in addition to logged signal data (see “Signal Logging” in the Simulink User's Guide)
- An interactive automatic data typing feature that proposes fixed-point data types for appropriately configured objects in your model, and then allows you to selectively accept and apply the data type proposals

You can launch the Fixed-Point Tool for any system or subsystem, and the tool controls the object selected in its **System under design** pane. If Fixed-Point Designer software is installed, the Fixed-Point Tool displays the name, data type, design minimum and maximum values, minimum and maximum simulation values, and scaling of each model object that logs fixed-point data. Additionally, if a signal saturates or overflows, the tool displays the number of times saturation or overflow occurred.
Note If your model uses accelerator or rapid accelerator simulation modes, the Fixed-Point Tool changes the simulation mode to normal during range collection, and then sets it back to its original simulation mode once the range collection simulation is complete.

Overriding Fixed-Point Specifications

Most of the functionality in the Fixed-Point Tool is for use with the Fixed-Point Designer software. However, even if you do not have Fixed-Point Designer software, you can configure data type override settings to simulate a model that specifies fixed-point data types. In this mode, the Simulink software temporarily overrides fixed-point data types with floating-point data types when simulating the model.

Note If you use fi objects or embedded numeric data types in your model or workspace, you might introduce fixed-point data types into your model. You can set fipref to prevent the checkout of a Fixed-Point Designer license.

To simulate a model without using Fixed-Point Designer:

1 Enter the following at the command line.

```
set_param(gcs, 'DataTypeOverride', 'Double',...
    'DataTypeOverrideAppliesTo', 'AllNumericTypes',...
    'MinMaxOverflowLogging', 'ForceOff')
```

2 If you use fi objects or embedded numeric data types in your model, set the fipref DataTypeOverride property to TrueDoubles or TrueSingles (to be consistent with the model-wide data type override setting) and the DataTypeOverrideAppliesTo property to All numeric types.

For example, at the MATLAB command line, enter:

```
p = fipref('DataTypeOverride', 'TrueDoubles', ... 
    'DataTypeOverrideAppliesTo', 'AllNumericTypes');
```

“Propose Fraction Lengths Using Simulation Range Data” (Fixed-Point Designer) | Fixed-Point Tool
Introduced before R2006a
**gcb**

Get path name of current block

**Syntax**

```
bl = gcb
bl = gcb(sys)
```

**Description**

`bl = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`bl = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

**Examples**

**Get Path Name of Most Recently Selected Block**

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.
gcb
ans =

vdp/Mu

Get Parameters of Current Block

Open a model.

vdp

Select the Gain block.

Use the value of gcb with get_param to get the value of the Gain parameter.

```matlab
x = get_param(gcb,'Gain')
x =
1
```

Get Current Block in Specified System

Load the model.

```matlab
load_system('sldemo_fuelsys');
```

Get the current block in the fuel_rate_control subsystem.

```matlab
bl = gcb('sldemo_fuelsys/fuel_rate_control')
bl =
sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

Input Arguments

- `sys` — System that contains the block
  character vector
System that contains the block, specified as a character vector.
Example: 'vdp' 'sldemo_fuelsys/fuel_rate_control'

See Also
gcbh | gcbp | gcs | get_param

Topics
“Mask Callback Code”

Introduced before R2006a
gcbh

Get handle of current block

Syntax

gcbh

Description

gcbh returns the handle of the current block in the current system.

You can use this command to identify or address blocks that have no parent system. The command should be most useful to blockset authors.

Examples

This command returns the handle of the most recently selected block.

gcbh

ans =

281.0001

See Also

gcb | gcbp | gcs | getSimulinkBlockHandle

Introduced before R2006a
**gcbp**
Get `Simulink.BlockPath` object for current block

**Syntax**

```matlab
obj = gcbp
```

**Description**

`obj = gcbp` returns the `Simulink.BlockPath` object of the current block in the current system. The current block is:

- The most recently clicked block
- The last block loaded after opening a model

The returned `Simulink.BlockPath` object is context sensitive to model hierarchy.

**Examples**

Create `Simulink.BlockPath Object for Selected Block`

Open `sldemo_mdlref_basic`.

```matlab
sldemo_mdlref_basic
```

Click a block in the model hierarchy. For example, click the block labeled `ScopeA` in the `CounterA` instance of `sldemo_mdlref_counter`. Then, enter `obj = gcbp` at the command prompt.

```matlab
obj = gcbp
```

```matlab
obj = Simulink.BlockPath
```
Package: Simulink

Block Path:
  sldemo_mdlref_basic/CounterA
  sldemo_mdlref_counter/ScopeA

Use the getBlock method to access block path strings from this object.

Methods

See Also

gcb | gcbh | gcs | get_param

Introduced in R2019a
**gcs**

Get path name of current system

**Syntax**

`gcs`

**Description**

`gcs` returns the path name of the current system. The current system is one of these:

- During editing, the system or subsystem most recently clicked or that contains the block most recently clicked
- During simulation of a system that contains an S-Function block, the system or subsystem containing the S-Function block currently being evaluated
- During callbacks, the system containing any block whose callback routine is being executed
- During evaluation of `MaskInitialization`, the system containing the block whose mask is being evaluated
- The system most recently loaded into memory with `load_system`; only the first use of `load_system` makes the model the current system

The current system is the current model or a subsystem of the current model. Use `bdroot` to get the current model.

If you close the model that contains the current system, another open or loaded system becomes the current one. Use `gcs` to find out the new current system.

To explicitly set the current system, you can either:

- Use `set_param` with the 'CurrentSystem' parameter on the root Simulink model, for example:

  ```matlab
  set_param(0,'CurrentSystem','mymodel')
  ```
- Open the model by using `open_system` or the model name at the MATLAB command prompt.

## Examples

### Get Current System That Contains a Block

Return the path of the system that contains the most recently selected block.

Open the model `sldemo_fuelsys`. Open the subsystem To Controller.

```matlab
sldemo_fuelsys
open_system('sldemo_fuelsys/To Controller')
```

Click the Rate Transition block. Get the current system.

```matlab
gcs
ans =
    'sldemo_fuelsys/To Controller'
```

### Get Current System After Loading a Model

Open the model `f14` and get the current system.

```matlab
f14
gcs
ans =
    'f14'
```

Load the model `vdp` using `load_system`. Then get the current system.

```matlab
load_system('vdp');
gcs
ans =
    'vdp'
```
To remove vdp from memory, close it. In this example, the current system becomes the open model, f14.

close_system('vdp');
gcs

ans =

    'f14'

See Also
bdroot | gcb | gcbp

Introduced before R2006a
get_param

Get parameter names and values

Syntax

ParamValue = get_param(Object,Parameter)

Description

ParamValue = get_param(Object,Parameter) returns the name or value of the specified parameter for the specified model or block object. Open or load the Simulink model first.

Tip If you make multiple calls to get_param for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use getSimulinkBlockHandle to get a block handle.

For parameter names, see:

• “Model Parameters” on page 6-2
• “Block-Specific Parameters” on page 6-132
• “Common Block Properties” on page 6-112

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the vdp model.

load_system('vdp');

Get the value for the Expression block parameter.
BlockParameterValue = get_param('vdp/Fcn','Expression')

BlockParameterValue =
    1 - u*u

Get the value for the SolverType model parameter.

SolverType = get_param('vdp','SolverType')

SolverType =
    Variable-step

**Get Root Parameter Names and Values**

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

RootParameterNames = fieldnames(get_param(0,'ObjectParameters'));
load_system('vdp')
ModelParameterNames = fieldnames(get_param('vdp','ObjectParameters'));
GlobalParameterNames = setdiff(RootParameterNames,ModelParameterNames)

GlobalParameterNames =
    'AutoSaveOptions'
    'CacheFolder'
    'CallbackTracing'
    'CharacterEncoding'
    ...
    'CurrentSystem'

Get the value of a global parameter.

GlobalParameterValue = get_param(0,'CurrentSystem')

GlobalParameterValue =
    vdp

**Get Model Parameter Names and Values**

Get a list of model parameters for the vdp model.
load_system('vdp')
ModelParameterNames = get_param('vdp','ObjectParameters')

ModelParameterNames =
    Name: [1x1 struct]
    Tag: [1x1 struct]
    Description: [1x1 struct]
    Type: [1x1 struct]
    Parent: [1x1 struct]
    Handle: [1x1 struct]
    . . .
    Version: [1x1 struct]

Get the current value of the ModelVersion model parameter for the vdp model.

ModelParameterValue = get_param('vdp','ModelVersion')
ModelParameterValue = 1.6

**Get All Blocks and a Parameter Value**

Get a list of block paths and names for the vdp model.

load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')

BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'

Get a list of block dialog parameters for the Fcn block.

BlockDialogParameters = get_param('vdp/Fcn','DialogParameters')

2-348
BlockDialogParameters =
    Expr: [1x1 struct]
    SampleTime: [1x1 struct]

Get the value for the Expr block parameter.

BlockParameterValue = get_param('vdp/Fcn','Expr')

BlockParameterValue =
    1 - u*u

**Get a Block Parameter Value Using a Block Handle**

If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, e.g., `'vdp/Fcn'`.

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use `getSimulinkBlockHandle` to load the `vdp` model if necessary (by specifying `true`), and get a handle to the FCN block.

fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);

Use the block handle with `get_param` and get the value for the Expr block parameter.

BlockParameterValue = get_param(fcnblockhandle,'Expression')

BlockParameterValue =
    1 - u*u

**Display Block Types for all Blocks in a Model**

Get a list of block paths and names for the vdp model.

load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')
BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'

Get the value for the BlockType parameter for each of the blocks in the vdp model.

BlockTypes = get_param(BlockPaths,'BlockType')

BlockTypes =
    'Fcn'
    'SubSystem'
    'SubSystem'
    'Gain'
    'Mux'
    'Product'
    'Scope'
    'Sum'
    'Integrator'
    'Integrator'
    'Outport'
    'Outport'

**Input Arguments**

**Object — Name or handle of a model or block, or root**

handle | character vector | cell array of character vectors | string array | 0

Handle or name of a model or block, or root, specified as a numeric handle or a character vector, a cell array of character vectors for multiple blocks, or 0 for root. A numeric handle must be a scalar. You can also get parameters of lines and ports, but you must use numeric handles to specify them.
Tip If you make multiple calls to get_param for the same block, then specifying a block using a numeric handle is more efficient than using the full block path. Use getSimulinkBlockHandle to get a block handle. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Specify 0 to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector™ parameters.

Example: 'vdp/Fcn'

Parameter — Parameter of model or block, or root
-character vector | string scalar

Parameter of model or block, or root, specified as a character vector or 0 for root. The table shows special cases.

<table>
<thead>
<tr>
<th>Specified Parameter</th>
<th>Result</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>'ObjectParameters'</td>
<td>Returns a structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.</td>
<td></td>
</tr>
<tr>
<td>'DialogParameters'</td>
<td>Returns a structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.</td>
<td></td>
</tr>
</tbody>
</table>
**Specified Parameter**

Parameter name, e.g., 'BlockType'. Specify any model or block parameter, or block dialog box parameter.

**Result**

Returns the value of the specified model or block parameter.

If you specified multiple blocks as a cell array, returns a cell array with the values of the specified parameter common to all blocks. All of the specified blocks in the cell array must contain the parameter, otherwise the function returns an error.

**Example:** 'ObjectParameters'

**Data Types:** char

### Output Arguments

**ParamValue** — The name or value of the specified parameter for the specified model or block, or root

any data type, depending on the parameter

The name or value of the specified parameter for the specified model or block, or root. If you specify multiple objects, the output is a cell array of objects. The table shows special cases.

<table>
<thead>
<tr>
<th>Specified Parameter</th>
<th>ParamValue Returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>'ObjectParameters'</td>
<td>A structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.</td>
</tr>
<tr>
<td>'DialogParameters'</td>
<td>A structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.</td>
</tr>
<tr>
<td>Specified Parameter</td>
<td>ParamValue Returned</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Parameter name, e.g., 'BlockType'</td>
<td>The value of the specified model or block parameter. If multiple blocks are specified as a cell array, returns a cell array with the values of the specified parameter common to all blocks.</td>
</tr>
</tbody>
</table>

If you get the root parameters by specifying `get_param(0,'ObjectParameters')`, then the output `ParamValue` is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- **Type** — Parameter type values are: 'boolean', 'string', 'int', 'real', 'point', 'rectangle', 'matrix', 'enum', 'ports', or 'list'
- **Enum** — Cell array of enumeration character vector values that applies only to 'enum' parameter types
- **Attributes** — Cell array of character vectors defining the attributes of the parameter. Values are: 'read-write', 'read-only', 'read-only-if-compiled', 'write-only', 'dont-eval', 'always-save', 'never-save', 'nondirty', or 'simulation'

getActiveConfigSet

Get model's active configuration set or configuration reference

Syntax

myConfigObj = getActiveConfigSet(model)

Arguments

model

The name of an open model, or gcs to specify the current model

Description

getActiveConfigSet returns the configuration set or configuration reference (configuration object) that is the active configuration object of model.

Examples

The following example returns the active configuration object of the current model. The code is the same whether the object is a configuration set or configuration reference.

myConfigObj = getActiveConfigSet(gcs);

“Manage a Configuration Reference”
Introduced before R2006a
getCallbackAnnotation

Get annotation executing callback

Syntax

ann = getCallbackAnnotation

Description

ann = getCallbackAnnotation gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see “Associate a Click Function with an Annotation”.

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open vdp. Add and position two annotations. Each annotation displays a different value.

open_system('vdp');
an1 = Simulink.Annotation('vdp/1');
an1.position = [100,300];
an2 = Simulink.Annotation('vdp/3');
an2.position = [150,300];

Assign a click function to each annotation. The click function uses getAnnotationCallback to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (Mu).
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain'',v)'
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'',''Gain'',v)'

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

**Output Arguments**

ann — Annotation
Simulink.Annotation instance

Annotation, returned as a Simulink.Annotation instance.

**See Also**

Simulink.Annotation

**Topics**

“Associate a Click Function with an Annotation”

**Introduced before R2006a**
**getComponent**

Get a configuration set component

**Syntax**

```matlab
component = getComponent(cs, componentName)
```

**Description**

```matlab
component = getComponent(cs, componentName)
```
returns the specified component from a configuration set. With no component name specified, returns a list of the components contained in the configuration set.

**Examples**

**Get a Component for a Configuration Set**

Get the solver component for the active configuration set.

Get the active configuration set of the currently selected model.

```matlab
hCs = getActiveConfigSet(gcs);
```

Get the solver component of the active configuration set.

```matlab
hSolverConfig = getComponent(hCs, 'Solver');
```

**Get List of Components for an Active Configuration Set**

Get a list of the components contained in the active configuration set.

Get the active configuration set of the currently selected model.
hCs = getActiveConfigSet(gcs);

Get the list of components contained in the configuration set.

getComponent(hCs)

The code displays the names of the components at the MATLAB command line.

**Input Arguments**

- **cs** — Configuration set object
  - ConfigSet object
  - Configuration set, specified as a ConfigSet object

- **componentName** — Component name
  - character vector
  - Name of a component object, specified as a character vector. If a component name is not specified, the function displays a list of the components contained in the configuration set at the MATLAB command line.
  - Example: 'Solver'

**Output Arguments**

- **component** — Component
  - Simulink.ConfigComponent object
  - A component in the configuration set, returned as an instance of a Simulink.ConfigComponent object

**See Also**

**Topics**

- “About Configuration Sets”
- “Manage a Configuration Set”
Introduced before R2006a
getConfigSet

Get one of model's configuration sets or configuration references

Syntax

myConfigObj = getConfigSet(model, configObjName)

Arguments

model
  The name of an open model, or gcs to specify the current model
configObjName
  The name of a configuration set (Simulink.ConfigSet) or configuration reference (Simulink.ConfigSetRef)

Description

getConfigSet returns the configuration set or configuration reference (configuration object) that is attached to model and is named configObjName. If no such object exists, the function returns an empty object.

Examples

The following example returns the configuration object that is named DevConfig and attached to the current model. The code is the same whether DevConfig is a configuration set or configuration reference.

  myConfigObj = getConfigSet(gcs, 'DevConfig');

getConfigSets
Get names of all of model's configuration sets or configuration references

Syntax
myConfigObjNames = getConfigSets(model)

Arguments
model
The name of an open model, or gcs to specify the current model

Description
getConfigSets returns a cell array of character vectors specifying the names of all configuration sets and configuration references (configuration objects) attached to model.

Examples
The following example obtains the names of the configuration objects attached to the current model.

myConfigObjNames = getConfigSets(gcs)

getfullname

Get pathname of block or line

Syntax

path=getfullname(handle)

Description

path=getfullname(handle) returns the full pathname of the block or line specified by handle.

Examples

getfullname(gcb) returns the pathname of the block currently selected in the model editor's window.

The following code returns the pathname of the line currently selected in the model editor's window.

```matlab
line = find_system(gcs, 'SearchDepth', 1, 'FindAll', 'on', ...
    'Type', 'line', 'Selected', 'on');
path = getfullname(line);
```

See Also

find_system | gcb

Introduced in R2007a
getInputString

Create comma-separated list of variables to map

Syntax

externalInputString = getInputString(inputmap,'base')

externalInputString = getInputString(inputmap, filename)

externalInputString = getInputString(inputmap)

Description

externalInputString = getInputString(inputmap,'base') creates an input character vector using the supplied mapping inputmap and the variables loaded in the base workspace ('base').

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the sim command. Load the variables in the base workspace first.
- As input for the Configuration Parameters > Data Import/Export > Input parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

externalInputString = getInputString(inputmap, filename) creates an input character vector using the supplied mapping inputmap and the variables defined in filename.

externalInputString = getInputString(inputmap) creates an input character vector using the signals from the most recently created mapping.

Examples
Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model

`slexAutotransRootInportsExample;`

Create signal variables in the base workspace

```matlab
Throttle = timeseries(ones(10,1)*10);
Brake = timeseries(zeros(10,1));
```

Create a mapping (inputMap) for the model.

```matlab
inputMap = getRootInportMap('model','slexAutotransRootInportsExample','signalName',{'Throttle','Brake'},'blockName',{'Throttle','Brake'});
```

Call `getInputString` with `inputMap` and 'base' as inputs.

```matlab
externalInputString = getInputString(inputMap,'base')
```

```matlab
externalInputString =
    Throttle, Brake
```

Simulate the model with the input character vector.

```matlab
sim('slexAutotransRootInportsExample','ExternalInput',externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```matlab
Throttle = timeseries(ones(10,1)*10);
Brake = timeseries(zeros(10,1));
save('input.mat','Throttle','Brake');
```

Open the model.
slexAutotransRootInportsExample;

Create map object.

inputMap = getRootInportMap('model', ...  
'slexAutotransRootInportsExample', ...  
'signalName', {'Throttle', 'Brake'}, ...  
'blockName', {'Throttle', 'Brake'});

Get the resulting input character vector.

externalInputString = getInputString(inputMap, 'input.mat')

externalInputString =
Throttle, Brake

Load variables from the base workspace for the simulation.

load('input.mat');

Simulate the model.

sim('slexAutotransRootInportsExample', 'ExternalInput', ...  
   externalInputString);

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

slexAutotransRootInportsExample;

Create signal variables in the base workspace

Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));

Create a mapping vector for the model.

inputMap = getSlRootInportMap('model', 'slexAutotransRootInportsExample', ...  
   'MappingMode', 'BlockName', ...
Get the resulting input character vector.

```matlab
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```matlab
sim('slexAutotransRootInportsExample','ExternalInput',
    externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of `externalInputString` (Throttle, Brake) into the **Data Import/Export > Input** parameter. Apply the changes, and then simulate the model.

### Output Arguments

`externalInputString — External input`  
comma-separated character vector

`inputmap — Map object`  
character vector

Map object, as returned from the `getRootInportMap` or `getSlRootInportMap` functions.

`filename — Input variables`  
MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.  
Example: 'data.mat'  
Data Types: char

### Input Arguments

`filename`  
Input variables, contained in a MAT-file. The file contains variables to map.  
Example: 'data.mat'  
Data Types: char
External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the sim command or the Configuration Parameters > Data Import/Export > Input parameter.

Topics
“Map Root Inport Signal Data”

Introduced in R2013a
getRootInportMap

Create custom object to map signals to root-level inports

Syntax

map = getRootInportMap('Empty');
map = getRootInportMap(model,mdl,Name,Value);
map = getRootInportMap(inputmap,map,Name,Value);

Description

map = getRootInportMap('Empty'); creates an empty map object, map. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

map = getRootInportMap(model,mdl,Name,Value); creates a map object for model, mdl, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the getInputString function.

map = getRootInportMap(inputmap,map,Name,Value); overrides the mapping object with the specified property. You can override only the properties model, blockName, and signalName. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the getInputString function.

Use the getRootInportMap function when creating a custom mapping mode to map data to root-level inports. See the example file BlockNameIgnorePrefixMap.m, located in matlabroot/help/toolbox/simulink/examples, for an example of a custom mapping algorithm.
Input Arguments

Empty

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

model

Name of model to associate with the root inport map.

Default: None

blockName

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:
Block name of root-level input ports.
Cell array containing multiple block names of root-level input ports.

Default: None

signalName

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:
Signal name to be mapped.
Cell array containing multiple signal names of signals to be mapped.

**Default:** None

`inputmap`

Name of mapping object to override.

**Default:** None

## Output Arguments

**map**

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

## Examples

### Empty Mapping Object

Create an empty custom mapping object.

```matlab
map = getRootInportMap('Empty')
map =
    1x0 InputMap array with properties:
          Type
    DataSourceName
          Destination
```

### Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`. 

signalIn1 = timeseries((1:10)')

Common Properties:
   Name: 'unnamed'
   Time: [10x1 double]
   TimeInfo: [1x1 tsdata.timemetadata]
   Data: [10x1 double]
   DataInfo: [1x1 tsdata.datametadata]

Create a mapping object for the time series object for the model, ex_minportsOnlyModel.

modelFile = fullfile(matlabroot,'help','toolbox','simulink','examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel','blockName','In1','signalname','signalIn1')

map =

   InputMap with properties:
       Type: 'Inport'
       DataSourceName: 'signalIn1'
       Destination: [1x1 Simulink.iospecification.Destination]

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model ex_minportsOnlyModel.

Create a mapping object of vectors.

modelFile = fullfile(matlabroot,'help','toolbox','simulink','examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel','blockName',{'In1' 'In2'},'signalname',{'signalIn1' 'signalIn2'})

map =

   1x2 InputMap array with properties:
**Overriding Maps**

Create a mapping object that contains the signal `var2`, then override `var2` with `var1`.

Create a mapping object of vectors.

```matlab
% Load the model and define variables
modelFile = fullfile(matlabroot,'help','toolbox','simulink',
        'examples','ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';

% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model',modelValue,...
        'blockName',blockNameValue,...
        'signalName',signalNameToOverload)

mapToOverload =
    InputMap with properties:
        Type: 'Inport'
        DataSourceName: 'var1'
        Destination: [1x1 Simulink.iiospecification.Destination]
```

**Tips**

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getSlRootInportMap` function instead.
See Also
getInputString | getSlRootInportMap

Topics
“Create Custom Mapping File Function”

Introduced in R2012b
getSimulinkBlockHandle

Get block handle from block path

Syntax

handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)

Description

handle = getSimulinkBlockHandle(path) returns the numeric handle of the block specified by path, if it exists in a loaded model or library. Returns -1 if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by getSimulinkBlockHandle to manipulate the block in subsequent calls to get_param or set_param. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use getSimulinkBlockHandle to check whether a block path is valid. This approach is more efficient than calling get_param inside a try statement.

handle = getSimulinkBlockHandle(path,true) attempts to load the model or library containing the specified block path, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the Pilot block.
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')

handle = 
    562.0004

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the `Pilot` block.

handle = getSimulinkBlockHandle('f14/Pilot',true)

handle = 
    562.0004

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns -1.

valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0

valid_block_path = 
    0

The model contains the block but the model is not loaded, so this command returns 0 because it cannot find the block.
Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

### Input Arguments

**path — Block path name**

character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

### Output Arguments

**handle — Numeric handle of a block**

double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

`get_param` | `set_param`

### Introduced in R2015a
getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```matlab
inputMap = getSlRootInportMap('model', modelName, 'MappingMode', mappingMode, 'SignalName', signalName, 'SignalValue', signalValue)
[inputMap, hasASignal] = getSlRootInportMap('model', modelName, 'MappingMode', mappingMode, 'SignalName', signalName, 'SignalValue', signalValue)
inputMap = getSlRootInportMap('model', modelName, 'MappingMode', 'Custom', 'CustomFunction', customFunction, 'SignalName', signalName, 'SignalValue', signalValue)
[inputMap, hasASignal] = getSlRootInportMap('model', modelName, 'MappingMode', 'Custom', 'CustomFunction', customFunction, 'SignalName', signalName, 'SignalValue', signalValue)
```

Description

```matlab
inputMap = getSlRootInportMap('model', modelName, 'MappingMode', mappingMode, 'SignalName', signalName, 'SignalValue', signalValue) creates a root inport map using one of the Simulink mapping modes. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the getInputString function.

[inputMap, hasASignal] = getSlRootInportMap('model', modelName, 'MappingMode', mappingMode, 'SignalName', signalName, 'SignalValue', signalValue) returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the getInputString function.

inputMap = getSlRootInportMap('model', modelName, 'MappingMode', 'Custom', 'CustomFunction',
```
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
creates a root inport map using a custom mapping mode specified in customfunction.
Load the model before using this function. If you do not load the model first, the function
loads the model to make the mapping and then closes the model afterwards. To create a
comma-separated list of variables to map from this object, use the getInPutString
function.

[inputMap,hasASignal] = getSlRootInportMap('model',
modelName,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
returns a vector of logical values specifying whether or not the root inport map has a
signal associated with it. To create a comma-separated list of variables to map from this
object, use the getInPutString function.

To map signals to root-level inports using custom mapping modes, you can use
getSlRootInport with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

Throttle = timeseries(ones(10,1)*10);
Brake    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',
    'MappingMode','BlockName',
    'SignalName',{'Throttle' 'Brake'},
    'SignalValue',{Throttle Brake});

Create inport map using custom function

Create a vector of inport maps using a custom function

port1    = timeseries(ones(10,1)*10);
port2    = timeseries(zeros(10,1));
inputMap = getSlRootInportMap('model','slexAutotransRootInportsExample',
    'MappingMode','Custom',
    'CustomFunction','slexCustomMappingMyCustomMap',
    'SignalName',signalname,'SignalValue',signalvalue);
Input Arguments

`modelname` — Model name
character vector

Specify the model to associate with the root inport map.

Data Types: char

`mappingmode` — Simulink mapping mode
character vector

Specify the mapping mode to use with model name and data source. Possible values are:

- `'Index'` Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.
- `'BlockName'` Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.
- `'SignalName'` Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.
- `'BlockPath'` Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.
- `'Custom'` Apply mappings according to the definitions in a custom file.

Data Types: char

`customfunction` — Custom function file name
character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: char
**signalname — signal name**  
scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.  
Data Types: char | cell

**signalvalue — signal value**  
scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see “Choose a Base Workspace and MAT-File Format”.

### Output Arguments

**inputMap — input map**  
scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

**hasASignal — signal presence indicator**  
scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the `inputMap` has a signal associated with it. If the value is false the `inputMap` does not have a signal associated with it and will use a ground value as an input  
Data Types: logical

### Tips

- Load the model before running this function.
- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

getInputString | getRootInportMap

Topics
“Map Root Inport Signal Data”

Introduced in R2013b
hdllib

Display blocks that are compatible with HDL code generation

Syntax

hdllib
hdllib('off')
hdllib('html')
hdllib('librarymodel')

Description

hdllib displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter hdllib('off').

hdllib('off') displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

hdllib('html') creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (hdlblklist.html) and a table of blocks and their HDL code generation parameters (hdlsupported.html).

To run hdllib('html'), you must have an HDL Coder license.

hdllib('librarymodel') displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.
The default library name is `hdlsupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

To run `hdllib('librarymodel')`, you must have an HDL Coder license.

### Examples

#### Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```matlab
hdllib
```

```matlab
### Generating view of HDL Coder compatible blocks in Library Browser.
### To restore the Library Browser to the default Simulink view, enter "hdllib off".
```
Display All Blocks in the Library Browser

To display all blocks in the Library Browser, regardless of HDL code generation compatibility:

```matlab
hdllib('off')
```

### Restoring Library Browser to default view; removing the HDL Coder compatibility filter.
Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdllib('html')
```
Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

```matlab
hdllib('librarymodel')
```

The `hdlsupported` block library opens.

Introduced in R2006b
hilite_system

Highlight block, signal line, port, or annotation

Syntax

hilite_system(obj)
hilite_system(obj,style)

Description

hilite_system(obj) highlights a block, line, port, or annotation in an open model using the default highlight style. Use hilite_system with a port to highlight the signal line attached to the port. Each use of hilite_system adds to the highlighting. Highlighting is not saved with the model.

hilite_system(obj,style) uses the specified highlighting style.

Examples

Highlight Block Using Default Highlight Style

Open the model slexAircraftExample.

slexAircraftExample

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

hilite_system('slexAircraftExample/Controller')

Highlight a Block Using a Highlight Style

Open the model vdp.
Highlight the Mu block using the style 'fade'.

hilite_system('vdp/Mu','fade')

**Use Block Highlighting to Trace Generated Code**

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

`f14`

In the model configuration parameters, in the *Solver* pane, set *Type* to *Fixed-step*.

Generate code for the model. In the *Apps* tab, under *Code Generation*, click *Embedded Coder*. The *C Code* tab appears. Click *Build*.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

Highlight a block using a traceability tag.

`hilite_system('<Root>/Stick Input')`
Highlight a block in a subsystem.

hilite_system(''<S3>/W-gust model'')
Customize a Highlighting Style

You can customize a highlighting style by setting the 'HiliteAncestorsData' parameter on the root-level model using `set_param` in this form:

```matlab
set_param(0,'HiliteAncestorsData',hiliteData)
```

Specify `hiliteData` as a structure array that has these fields:

- 'HiliteType' — Highlighting style to customize, such as 'user1', 'debug', or 'error'.
- 'ForegroundColor' — Color for block fill.
- 'BackgroundColor' — Color for block outline.

The supported values for 'ForegroundColor' and 'BackgroundColor' are:

- 'black'
- 'white'
- 'gray'
- 'red'
- 'orange'
- 'yellow'
- 'green'
- 'darkGreen'
- 'blue'
- 'lightBlue'
- 'cyan'
- 'magenta'

Define a highlight style for 'user1', and customize the style for 'debug'.

```matlab
set_param(0,'HiliteAncestorsData',...
    struct('HiliteType','user1',...
        'ForegroundColor','darkGreen',...
        'BackgroundColor','lightBlue'));
set_param(0,'HiliteAncestorsData',...
    struct('HiliteType','debug',...
        'ForegroundColor','red',...
        'BackgroundColor','black'));
```
Use the defined style to highlight a block.

hilite_system('f14/Controller/Alpha-sensor Low-pass Filter','user1')

**Input Arguments**

**obj — Block, port, line, or annotation to highlight**

block path name | Simulink.BlockPath object | numeric handle | Simulink identifier | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A Simulink.BlockPath object
- A numeric handle for lines, ports, or annotations
- Simulink identifier
- A traceability tag from the comments of Simulink Coder generated code.

Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- Root
- A unique system number assigned by Simulink during code generation

Example: 'vdp/Mu','sldemo_fuelsys/fuel_rate_control/airflow_calc','vdp:3','<Root>/Mu'

**style — Highlighting style**

'default' (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-393.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, in the Simulink Editor, in the **Signal** tab, click **Remove Trace**.
• 'debug' — Uses default color scheme.
• 'different' — Applies red outline, white fill.
• 'error' — Uses default color scheme.
• 'fade' — Applies gray outline, white fill.
• 'find' — Applies dark blue outline, blue fill.
• 'lineTrace' — Applies red outline, blue fill.
• 'unique' — Dark blue outline, white fill.
• 'user1', 'user2', 'user3', 'user4', 'user5' — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color:

• 'orangeWhite'
• 'blackWhite'
• 'redWhite'
• 'blueWhite'
• 'greenWhite'

find_system | rtwtrace

Introduced before R2006a
isLoaded

(Not recommended) Determine if project is loaded

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
loaded = isLoaded(proj)
```

**Description**

`loaded = isLoaded(proj)` returns whether the project referenced by the project object `proj` is loaded.

**Examples**

**Find Out if Project Is Loaded**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Find out if the project is still loaded.

```matlab
loaded = isLoaded(proj)
```
loaded =
    1

**Input Arguments**

proj — Project
project

Project, specified as a project object. Use simulinkproject to create a project object to manipulate a Project at the command line.

**Output Arguments**

loaded — Loaded status
1 | 0

Project loaded status, returned as true (1) if the project is loaded.

Data Types: logical

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Functions
reload | simulinkproject

Introduced in R2013a
**legacy_code**

Use Legacy Code Tool

**Syntax**

```matlab
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelname)
legacy_code('sblock_generate', specs, modelname)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

**Description**

The `legacy_code` function creates a MATLAB structure for registering the specification for existing C or C++ code and the S-function being generated. In addition, the function can generate, compile and link, and create a masked block for the specified S-function. Other options include generating

- A TLC file for simulation in Accelerator mode or code generation
- An `rtwmakecfg.m` file that you can customize to specify dependent source and header files that reside in a different directory than that of the generated S-function

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`specs = legacy_code('initialize')` initializes the Legacy Code Tool data structure, `specs`, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', specs)` generates an S-function source file as specified by the Legacy Code Tool data structure, `specs`. 
legacy_code('compile', specs, compilerOptions) compiles and links the S-function generated by the Legacy Code Tool based on the data structure, specs, and compiler options that you might specify. The compiler options must be supported by the mex (MATLAB) function.

legacy_code('generate_for_sim', specs, modelname) generates, compiles, and links the S-function in a single step. If the Options.useTlcWithAccel field of the Legacy Code Tool data structure is set to logical 1 (true), the function also generates a TLC file for accelerated simulations.

legacy_code('slblock_generate', specs, modelname) generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, specs. The block appears in the Simulink model specified by modelname. If you omit modelname, the block appears in an empty model editor window.

legacy_code('sfcn_tlc_generate', specs) generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, specs. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the ssSetOptions SimStruct function and SS_OPTION_USE_TLC_WITH_ACCELERATOR S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

legacy_code('sfcn_makecfg_generate', specs) generates an sFunction_makecfg.m file for the S-function generated by the Legacy Code Tool based on the data structure, specs. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use makecfg to Customize Generated Makefiles for S-Functions” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

legacy_code('rtwmakecfg_generate', specs) generates an rtwmakecfg.m file for the S-function generated by the Legacy Code Tool based on the data structure, specs. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use rtwmakecfg.m API to Customize Generated Makefiles” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).
legacy_code('backward_compatibility') automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in “Integrate C Functions Using Legacy Code Tool”.

**Input Arguments**

`sargs`

A structure with the following fields:

**Name the S-function**

`SFunctionName` (Required) — A character vector specifying a name for the S-function to be generated by the Legacy Code Tool.

**Define Legacy Code Tool Function Specifications**

- **InitializeConditionsFcnSpec** — A nonempty character vector specifying a function that the S-function calls to initialize and reset states. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- **OutputFcnSpec** — A nonempty character vector specifying the function that the S-function calls at each time step. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- **StartFcnSpec** — A character vector specifying the function that the S-function calls when it begins execution. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- **TerminateFcnSpec** — A character vector specifying the function that the S-function calls when it terminates execution. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.

**Define Compilation Resources**

- **HeaderFiles** — A cell array of character vectors specifying the file names of header files required for compilation.
• **SourceFiles** — A cell array of character vectors specifying source files required for compilation. You can specify the source files using absolute or relative path names.

• **HostLibFiles** — A cell array of character vectors specifying library files required for host compilation. You can specify the library files using absolute or relative path names.

• **TargetLibFiles** — A cell array of character vectors specifying library files required for target (that is, standalone) compilation. You can specify the library files using absolute or relative path names.

• **IncPaths** — A cell array of character vectors specifying directories containing header files. You can specify the directories using absolute or relative path names.

• **SrcPaths** — A cell array of character vectors specifying directories containing source files. You can specify the directories using absolute or relative path names.

• **LibPaths** — A cell array of character vectors specifying directories containing host and target library files. You can specify the directories using absolute or relative path names.

**Specify a Sample Time**

**SampleTime** — One of the following:

• `'inherited'` (default) — Sample time is inherited from the source block.

• `'parameterized'` — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as `mxGetPr` or `mxGetData`.

• **Fixed** — Sample time that you explicitly specify. For information on how to specify sample time, see “Specify Sample Time”.

If you specify this field, you must specify it last.

**Define S-Function Options**

**Options** — A structure that controls S-function options. The structure's fields include:

• **isMacro** — A logical value specifying whether the legacy code is a C macro. By default, the value is false (0).

• **isVolatile** — A logical value specifying the setting of the S-function `SS_OPTION_NONVOLATILE` option. By default, the value is true (1).
• **canBeCalledConditionally** — A logical value specifying the setting of the S-function SS_OPTION_CAN_BE_CALLED_CONDITIONALLY option. By default, the value is true (1).

• **useTlcWithAccel** — A logical value specifying the setting of the S-function SS_OPTION_USE_TLC_WITH_ACCELERATOR option. By default, the value is true (1).

• **language** — A character vector specifying either 'C' or 'C++' as the target language of the S-function that Legacy Code Tool will produce. By default, the value is 'C'.

**Note** The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see “Legacy Code Tool Limitations” in the Simulink documentation.

• **singleCPPMexFile** — A logical value that, if true, specifies that generated code:
  
  • Requires you to generate and manage an inlined S-function as only one file (.cpp) instead of two (.c and .tlc).
  • Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

By default, the value is false.

**Limitations** You cannot set the singleCPPMexFile field to true if

• Options.language='C++'

• You use one of the following Simulink objects with the IsAlias property set to true:
  
  • Simulink.Bus
  • Simulink.AliasType
  • Simulink.NumericType

• The Legacy Code Tool function specification includes a void* or void** to represent scalar work data for a state argument

• HeaderFiles field of the Legacy Code Tool structure specifies multiple header files
• **supportsMultipleExecInstances**— A logical value specifying whether to include a call to the `ssSupportsMultipleExecInstances` function. By default, the value is `false (0)`.

• **convertNDArrayToRowMajor**— A logical value specifying the automatic conversion of a matrix between a column-major format and a row-major format. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is `false (0)`. If you currently specify the previous version of the option, `convert2DMatrixToRowMajor`, the function automatically specifies the new `convertNDArrayToRowMajor` option.

**Note** This option does not support a 2-D matrix of complex data.

• **supportCoverage**— A logical value specifying whether the generated S-function must be compatible with Model Coverage. By default, the value is `false (0)`.

• **supportCoverageAndDesignVerifier**— A logical value specifying whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier™. By default, the value is `false (0)`.

• **outputsConditionallyWritten**— A logical value specifying whether the legacy code conditionally writes the output ports. If `true`, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (`SS_NOT_REUSABLE_AND_GLOBAL`). If `false`, the memory associated with each output port is reusable and is local (`SS_REUSABLE_AND_LOCAL`). By default, the value is `false (0)`. For more information, see `ssSetOutputPortOptimOpts`.

**modelname**

The name of a Simulink model into which Legacy Code Tool is to insert the masked S-function block generated when you specify `legacy_code` with the action character vector `'slblock_generate'`. If you omit this argument, the block appears in an empty model editor window.

**Introduced in R2006b**
libinfo

Get information about library blocks referenced by model

Syntax

libdata = libinfo('system')
libdata = libinfo('system', constraint1, value1, ...)

Description

libdata = libinfo('system') returns information about library blocks referenced by system and all the systems underneath it.

libdata = libinfo('system', constraint1, value1, ...) restricts the search as indicated by the search constraint(s) c1, v1, ...

Input Arguments

system

The system to search recursively for library blocks.

constraint1, value1, ...

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with find_system.

Output Arguments

libdata

An array of structures that describes each library block referenced by system. Each structure has the following fields:
Block
Library
ReferenceBlock
LinkStatus

Path of the link to the library block
Name of the library containing the referenced block
Path of the library block
Value of the LinkStatus parameter for the link to the library block

See Also
find_system

Topics
“Create a Custom Library”

Introduced before R2006a
linmod

Extract continuous-time linear state-space model around operating point

Syntax

argout = linmod('sys');
argout = linmod('sys', x, u);
argout = linmod('sys', x, u, para);
argout = linmod('sys', x, u, 'v5');
argout = linmod('sys', x, u, para, 'v5');
argout = linmod('sys', x, u, para, xpert, upert, 'v5');

Arguments

sys
State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

x = Simulink.BlockDiagram.getInitialState('sys');

You can then change the operating point values within this structure by editing x.signals.values.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

x and u

Name of the Simulink system from which the linear model is extracted.

Ts
Sample time of the discrete-time linearized model

'v5'
An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling linmodv5.
para

A three-element vector of optional arguments:

- **para(1)** — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.

- **para(2)** — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.

- **para(3)** — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

**xpert** and **upert**

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

\[
\begin{align*}
\text{xpert} &= \text{para}(1) + 1e-3\times\text{para}(1)\times\text{abs}(x) \\
\text{upert} &= \text{para}(1) + 1e-3\times\text{para}(1)\times\text{abs}(u)
\end{align*}
\]

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

\[
\text{xpert} = \text{Simulink.BlockDiagram.getInitialState('sys');}
\]

You can then change the perturbation values within this structure by editing xpert.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling linmodv5 or specifying the 'v5' input argument to linmod.
linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

• \([A,B,C,D] = \text{linmod}('sys', x, u)\) obtains the linearized model of \(sys\) around an operating point with the specified state variables \(x\) and the input \(u\). If you omit \(x\) and \(u\), the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using \text{linmod} as an example:

• \([\text{num, den}] = \text{linmod}('sys', x, u)\) returns the linearized model in transfer function form.
• \(\text{sys\_struc} = \text{linmod}('sys', x, u)\) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

\text{linmod} compute a linear state-space model by linearizing each block in a model individually.

\text{linmod} obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.
Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose `i`th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Padé approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

Introduced in R2007a
linmod2

Extract continuous-time linear state-space model around operating point

Syntax

argout = linmod2('sys', x, u);
argout = linmod2('sys', x, u, para);

Arguments

sys  Name of the Simulink system from which the linear model is extracted.
x, u State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

x = Simulink.BlockDiagram.getInitialState('sys');

You can then change the operating point values within this structure by editing x.signals.values.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

para A three-element vector of optional arguments:

- para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

argout linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- \([A,B,C,D] = \text{linmod}('sys', x, u)\) obtains the linearized model of \(sys\) around an operating point with the specified state variables \(x\) and the input \(u\). If you omit \(x\) and \(u\), the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using \text{linmod} as an example:

- \([\text{num}, \text{den}] = \text{linmod}('sys', x, u)\) returns the linearized model in transfer function form.
- \(\text{sys\_struc} = \text{linmod}('sys', x, u)\) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

\text{linmod2} computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.
linmod2 obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

**Notes**

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose `i`th row is the block name associated with the `i`th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see “Linearizing Models”.

`dlinmod` | `linmod` | `linmodv5`

**Introduced in R2007a**
linmodv5

Extract continuous-time linear state-space model around operating point

Syntax

argout = linmodv5('sys');
argout = linmodv5('sys',x,u);
argout = linmodv5('sys', x, u, para);
argout = linmodv5('sys', x, u, para, xpert, upert);

Arguments

sys Name of the Simulink system from which the linear model is extracted.

x, u State (x) and the input (u) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify x. To extract the x structure from the model, use the following command:

x = Simulink.BlockDiagram.getInitialState('sys');

You can then change the operating point values within this structure by editing x.signals.values.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

2-416
**para**  
A three-element vector of optional arguments:

- **para(1)** — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.

- **para(2)** — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time \(t\) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.

- **para(3)** — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

**xpert, upert**  
The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

\[
xpert = \text{para}(1) + 1e-3\times\text{para}(1)\times\text{abs}(x)
\]
\[
upert = \text{para}(1) + 1e-3\times\text{para}(1)\times\text{abs}(u)
\]

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

\[
xpert = \text{Simulink.BlockDiagram.getInitialState('sys')};
\]

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.  

2-417
linmod, dlinmod, and linmod2 return state-space representations if you specify the output (left-hand) side of the equation as follows:

- \([A, B, C, D] = \text{linmod}('sys', x, u)\) obtains the linearized model of \(sys\) around an operating point with the specified state variables \(x\) and the input \(u\). If you omit \(x\) and \(u\), the default values are zero.

linmod and dlinmod both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using linmod as an example:

- \([\text{num}, \text{den}] = \text{linmod}('sys', x, u)\) returns the linearized model in transfer function form.
- \(\text{sys}_\text{struc} = \text{linmod}('sys', x, u)\) returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

### Description

linmodv5 computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

linmodv5 obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

### Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable \(\text{para}\) to a two-element vector, where the second element is used to set the value of \(t\) at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using
[sizes,x0,xstring] = sys

where xstring is a vector of strings whose ith row is the block name associated with the ith state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine ss2tf or to zero-pole form using ss2zp. You can also convert the linearized models to LTI objects using ss. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using tf or zpk.

The default algorithms in linmod and dlinmod handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

dlinmod | linmod | linmod2

Introduced in R2011b
load_system

Load Simulink model into memory

Syntax

handle = load_system(sys)

Description

handle = load_system(sys) loads the model sys into memory without opening the model in the Simulink Editor. After you load a model into memory, you can work with it using Simulink API commands. Save changes to the model using save_system.

Examples

Load Model into Memory

Load the model vdp into memory and return the model handle.

h = load_system("vdp")

h =

172.0004

Input Arguments

sys — Model to load into memory
character vector | string scalar

Model to load into memory, specified as a character vector or string scalar.

Example: "vdp"
Output Arguments

`handle` — Handle of loaded model

`handle`

Handle of loaded model.

See Also

`close_system` | `open_system` | `save_system`

Introduced before R2006a
loadIntoMemory

Load logged data into memory

Syntax

logs = loadIntoMemory(logs)

Description

logs = loadIntoMemory(logs) loads the data in logs into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use loadIntoMemory to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

Examples

Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

% Simulate model to generate logged data
sim('sldemo_fuelsys')

The simulation logs all of the instrumented signals in the model to the Simulink.SimulationData.Dataset object sldemo_fuelsys_output. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

% Load all logged signals into memory
loadIntoMemory(sldemo_fuelsys_output);
All of the data in sldemo_fuelsys_output is now available for efficient postprocessing.

**Input Arguments**

logs — Data to load into memory
'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data to load into memory. The loadIntoMemory function can load Simulink.SimulationData.Dataset and Simulink.SimulationOutput data.

Example: logsout

**Output Arguments**

logs — Data
'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data loaded into memory.

**See Also**

Simulink.SimulationData.Dataset | Simulink.SimulationOutput

Introduced in R2017b
model

Execute particular phase of simulation of model

Syntax

[sys,x0,str,ts] = model([],[],[],'sizes');
[sys,x0,str,ts] = model([],[],[],'compile');
outputs = model(t,x,u,'outputs');
derivs = model(t,x,u,'derivs');
dstates = model(t,x,u,'update');
model([],[],[],'term');

Description

The `model` command executes a specific phase of the simulation of a Simulink model whose name is `model`. The command’s last argument (flag) specifies the phase of the simulation to be executed. See “Simulation Phases in Dynamic Systems” for a description of the steps that Simulink software uses to simulate a model.

This command ignores the effects of state transitions and conditional execution. Therefore, it is not suitable for models which have such logic. Use this command for models which can be represented as simple dynamic systems. Such systems should meet these requirements.

- All states in the model must be built-in non-bus data types. For a discussion on built-in data types, see “About Data Types in Simulink”.
- If you are using vector format to specify the state, this command can access only non-complex states of `double` data type.
- There is minimal amount of state logic (Stateflow, conditionally executed subsystems etc.)
- The models are not mixed-domain models. That is, most blocks in the model are built-in Simulink blocks and do not include user-written S-functions or blocks from other Sim* products.
For models which do not comply with these requirements, using this command can cause Simulink to produce results which can only be interpreted by further analyzing and simplifying the model.

**Note** The state variable \( x \) can be represented in structure as well as vector formats. The variable follows the limitations of the format in which it is specified.

This command is also not intended to be used to run a model step-by-step, for example, to debug a model. Use the Simulink debugger if you need to examine intermediate results to debug a model.

**Arguments**

<table>
<thead>
<tr>
<th><strong>sys</strong></th>

<td>computes the derivatives of the model's continuous states at time step ( t ).</td>
</tr>
<tr>
<td>'term'</td>
<td>causes Simulink software to terminate simulation of the model.</td>
</tr>
</tbody>
</table>

**Note** The output, update, and derivs flags are valid only for single-tasking models. For more information on single-tasking and multi-tasking, see “Tasking Modes” (Simulink Coder).

### Examples

The following command executes the compilation phase of the vdp model that comes with Simulink software.

```matlab
vdp([], [], [], 'compile')
```

The following command terminates the simulation initiated in the previous example.

```matlab
vdp([], [], [], 'term')
```

**Note** Simulink does not let you close a model while it is compiling or simulating. For all phases except the 'sizes' phase, before closing the model, you must invoke the model command with the 'term' argument.

sim

Introduced in R2007a
modeladvisor

Open Model Advisor

Syntax

modeladvisor(model)

Description

modeladvisor(model) opens the Model Advisor for the model or subsystem specified by model. If the specified model or subsystem is not open, this command opens it.

Examples

Open Model Advisor for model

Open the Model Advisor for vdp example model:

modeladvisor('vdp')

Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the f14 example model:

modeladvisor('f14/Aircraft Dynamics Model')

Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:
modeladvisor(bdroot)

Open Model Advisor for currently selected subsystem
Open the Model Advisor on the currently selected subsystem:
modeladvisor(gcs)

Input Arguments

model — Model or subsystem name
character vector
Model or subsystem name or handle, specified as a character vector.
Data Types: char

See Also
“Run Model Advisor Checks”

Introduced before R2006a
new_system

Create Simulink model or library in memory

Syntax

h = new_system

h = new_system(name)
h = new_system(name,'FromTemplate',template)
h = new_system(name,'FromFile',file)
h = new_system(___,'ErrorIfShadowed')

h = new_system(name,'Model')
h = new_system(name,'Model',subsys)
h = new_system(name,'Subsystem')
h = new_system(name,'Library')
h = new_system(___,'ErrorIfShadowed')

Description

h = new_system creates a model named untitled (and then untitled1, untitled2, and so on) based on your default model template and returns the new model’s numeric handle. Select your default model template on the Simulink start page or by using the Simulink.defaultModelTemplate function.

The new_system function does not open the new model. This function creates the model in memory. To save the model, use save_system, or open the model with open_system and then save it using the Simulink Editor.

h = new_system(name) creates a model based on your default model template and gives the new model the specified name. This function returns the new model’s numeric handle. Select your default model template on the Simulink start page or by using the Simulink.defaultModelTemplate function.

If name is empty, the function creates a model named untitled, untitled1, untitled2, and so on.
The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

```matlab
h = new_system(name,'FromTemplate',template) creates the model based on the specified template.
```

```matlab
h = new_system(name,'FromFile',file) creates the model based on the specified model or template.
```

```matlab
h = new_system(___,'ErrorIfShadowed') creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.
```

```matlab
h = new_system(name,'Model') creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle 0. If name is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.
```

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

```matlab
h = new_system(name,'Model',subsys) creates a model based on the subsystem `subsys` in a currently loaded model.
```

```matlab
h = new_system(name,'Subsystem') creates an empty subsystem file that has the specified name.
```

```matlab
h = new_system(name,'Library') creates an empty library that has the specified name and returns a numeric handle.
```

```matlab
h = new_system(___,'ErrorIfShadowed') returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.
```

**Examples**
**Create a Model Based on Default Template**

Create a model in memory called untitled.

```matlab
h = new_system;
```

You can use `get_param` to get the name.

```matlab
get_param(h,'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h,'Name'))
```

```matlab
ans =
untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

**Create a Model Based on Named Template**

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template, then in the **Simulation** tab, select **Save > Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```matlab
h = new_system('templateModel','FromTemplate','mytemplate');
```

Invoking template `\myuserdir\Documents\MATLAB\mytemplate.sltx`

**Create a Model Based on Another Model**

Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.
h = new_system('mynewmodel','FromFile','myoldmodel.slx');

**Create Model from Subsystem**

Load the model f14. Create a model based on the Controller subsystem.

load_system('f14');
new_system('mycontroller','Model','f14/Controller');
open_system('mycontroller');

**Create a Library**

Create a library in memory and then open it.
new_system('mylib','Library')
open_system('mylib')

Create a Subsystem File

Create a subsystem file in memory and then open it.

new_system('mysubsystem','Subsystem')
open_system('mysubsystem')

Ensure Model Name Is Unique

Create a variable with the name myvar.

myvar = 17

Try to create a model that uses the same name as the variable. When you use the 'ErrorIfShadowed' option, the new_system function returns an error.

new_system('myvar2','Model','ErrorIfShadowed')

The model 'myvar2' cannot be created because this name is shadowing another name on the MATLAB path or in the workspace. Choose another name, or do not use the option 'ErrorIfShadowed'.

Input Arguments

name — Name of new model or library
character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not 'simulink'
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: 'mymodel', 'mylibrary'
subsys — Subsystem to base new model on
subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.
Example: 'f14/Controller'

template — Name of template to base new model on
character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor. In the Simulation tab, select Save > Template.
Example: 'mytemplate','mytemplate.sltx'

file — Path name of model or template to base new model on
character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an .mdl, .slx, or .sltx file. Include the extension and use a full or relative path.
Example: 'Models/mymodel.slx','mytemplate.sltx','model.mdl'

Simulink.defaultModelTemplate | open_system | save_system

Introduced before R2006a
num2fixpt

Convert number to nearest value representable by specified fixed-point data type

Syntax

outValue = num2fixpt(OrigValue, FixPtDataType, FixPtScaling, 
                     RndMeth, DoSatur)

Description

num2fixpt(OrigValue, FixPtDataType, FixPtScaling, RndMeth, DoSatur) returns the result of converting OrigValue to the nearest value representable by the fixed-point data type FixPtDataType. Both OrigValue and outValue are of data type double. As illustrated in the example that follows, you can use num2fixpt to investigate quantization error that might result from converting a number to a fixed-point data type. The arguments of num2fixpt include:

OrigValue

Value to be converted to a fixed-point representation. Must be specified using a double data type.

FixPtDataType

The fixed-point data type used to convert OrigValue.

FixPtScaling

Scaling of the output in either Slope or [Slope Bias] format. If FixPtDataType does not specify a generalized fixed-point data type using the sfix or ufix command, FixPtScaling is ignored.

RndMeth

Rounding technique used if the fixed-point data type lacks the precision to represent OrigValue. If FixPtDataType specifies a floating-point data type using the float command, RndMeth is ignored. Valid values are Zero, Nearest, Ceiling, or Floor (the default).
DoSatur Indicates whether the output should be saturated to the minimum or maximum representable value upon underflow or overflow. If FixPtDataType specifies a floating-point data type using the float command, DoSatur is ignored. Valid values are on or off (the default).

Examples

Suppose you wish to investigate the quantization effect associated with representing the real-world value 9.875 as a signed, 8-bit fixed-point number. The command

num2fixpt(9.875, sfix(8), 2^-1)

ans =

9.50000000000000

reveals that a slope of $2^{-1}$ results in a quantization error of 0.375. The command

num2fixpt(9.875, sfix(8), 2^-2)

ans =

9.75000000000000

demonstrates that a slope of $2^{-2}$ reduces the quantization error to 0.125. But a slope of $2^{-3}$, as used in the command

num2fixpt(9.875, sfix(8), 2^-3)

ans =

9.87500000000000

eliminates the quantization error entirely.

Introduced before R2006a
**open_system**

Open model, library, subsystem, or block dialog box

**Syntax**

open_system(obj)

double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any OpenFcn callback parameter is evaluated.
- If there is no OpenFcn callback, and a mask is defined, the mask parameter dialog box opens.
- Without an OpenFcn callback or a mask parameter, Simulink opens the object.
    - A referenced model opens in a new window.
    - A subsystem opens in a new tab in the same window.
    - For blocks, the parameters dialog box for the block opens.
To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys,'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys,'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys,'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk,'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the Look Under Mask menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk,'parameter')` opens the block parameter dialog box.

`open_system(blk,'OpenFcn')` runs the block callback `OpenFcn`.

**Examples**

**Open a Model**

Open the `f14` model.

`open_system('f14')`
Load a Model Without Opening it

Load the f14 model.

open_system('f14','loadonly')

Open a Subsystem

Open the Controller subsystem of the f14 model.

load_system('f14')
open_system('f14/Controller')

Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the Controller subsystem in a new tab.

f14
open_system('f14/Controller','tab')

Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

open_system('f14')
open_system('f14/Controller','window')

Open a Referenced Model

Open the model sldemo_mdlref_counter, which is referenced by the CounterA model block in sldemo_mdlref_basic.

open_system('sldemo_mdlref_basic')
open_system('sldemo_mdlref_basic/CounterA')

The referenced model opens in its own Simulink Editor window.
**Open Block Dialog Box**

Open the block parameters dialog box for the first Gain block in the Controller subsystem.

```matlab
load_system('f14')
open_system('f14/Controller/Gain')
```

**Run Block Open Callback Function**

Define an OpenFcn callback for a block and execute the block callback.

```matlab
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words Hello World appear on the MATLAB Command Prompt.

**Open Masked Subsystem**

Open the contents of the masked subsystem Vehicle in the model `sf_car`.

```matlab
open_system('sf_car')
open_system('sf_car/Vehicle', 'force')
```

**Open Multiple Systems with One Command**

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```matlab
models = {'f14','vdp'}
open_system(models)
```

**Input Arguments**

`obj` — Model, referenced model, library, subsystem, or block path character vector
Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., f14/Controller/Gain, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: char

sys — Model or library path
character vector

The full name or path of a model or library, specified as a character vector.

Data Types: char

sbsys — Subsystem path
character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: char

blk — Block or subsystem path
character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: char

close_system | load_system | new_system | save_system

Introduced before R2006a
**openDialog**

Open configuration parameters dialog

**Syntax**

openDialog(configObj)

**Arguments**

*configObj*

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

**Description**

`openDialog` opens a configuration parameters dialog box. If `configObj` is a configuration set, the dialog box displays the configuration set. If `configObj` is a configuration reference, the dialog box displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already open, its window becomes selected.

**Examples**

The following example opens a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```matlab
myConfigObj = getActiveConfigSet(gcs);
openDialog(myConfigObj);
```

Introduced in R2006b
parsim

Simulate dynamic system multiple times in parallel or serial

Syntax

simOut = parsim(in)
simOut = parsim(in,'ShowSimulationManager','on')
simOut = parsim(in,Name,Value)

Description

simOut = parsim(in) simulates a model using the inputs specified in the SimulationInput object, in. The parsim command uses an array of SimulationInput objects to run multiple simulations.

simOut = parsim(in,'ShowSimulationManager','on') simulates a model in parallel using the inputs specified in the SimulationInput object and opens the Simulation Manager UI. For more information, see Simulation Manager.

simOut = parsim(in,Name,Value) simulates a model in parallel using the inputs specified in the SimulationInput object and the options specified as the Name,Value pair.

The parsim command uses the Parallel Computing Toolbox license to run the simulations in parallel. parsim runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

Examples

Using parsim with Rapid Accelerator

Simulate the model, vdp, in rapid accelerator mode.

Load the model.
model = 'vdp';
load_system(model)

This step builds the Rapid Accelerator target

Simulink.BlockDiagram.buildRapidAcceleratorTarget(model);

Create a SimulationInput object and use setModelParameter method to set RapidAcceleratorUpToDateCheck to 'off'.

in = Simulink.SimulationInput(model);
in = in.setModelParameter('SimulationMode', 'rapid-accelerator');
in = in.setModelParameter('RapidAcceleratorUpToDateCheck', 'off');

Simulate the model.

out = parsim(in)

**Simulate Model in Parallel with parsim**

Simulate the model, CSTR, in parallel by sweeping over a variable. An array of SimulationInput objects is used to perform the sweep.

Specify sweep values.

FeedTempSweep = 250:10:300;

Create an array of SimulationInput objects.

```matlab
for i = length(FeedTempSweep):-1:1;
in(i) = Simulink.SimulationInput('CSTR');
in(i) = in(i).setVariable('FeedTemp0',FeedTempSweep(i));
end
```

Simulate the model in parallel.

out = parsim(in, 'ShowProgress', 'on')

[08-Jan-2018 14:10:43] Checking for availability of parallel pool...

[08-Jan-2018 14:12:09] Completed 6 of 6 simulation runs
[08-Jan-2018 14:12:09] Cleaning up parallel workers...

out =

1x6 Simulink.SimulationOutput array

**Input Arguments**

in — Simulink.SimulationInput object used to simulate the model
object, array

A Simulink.SimulationInput object or an array of Simulink.SimulationInput objects that is used to specify changes to the model for a simulation.

Example: in = Simulink.SimulationInput('vdp')

**Name-Value Pair Arguments**

**Note** All parameters passed to parsim command are unrelated to the parameters that are used with the sim command. To pass to the parsim command, use the list of following input arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name and Value must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'ShowProgress', 'on'

2-449
**AttachedFiles — Files to attach to parallel pool**
cell array
Specified as a cell array of additional files to attach to the parallel pool.

**ShowProgress — Show the progress of the simulations**
'on'(default) | 'off'
Set to 'on', to see the progress of the simulations in the command window. The progress is hidden when set to 'off'.

**Note** When the progress is shown, a message 'Cleaning up parallel workers..' may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations complete when the outputs are fetched from the future. For more information, see `Simulink.Simulation.Future`.

**RunInBackground — Run simulations in background**
'off' (default) | 'on'
Set to 'on' to run simulations asynchronously, keeping the MATLAB command prompt available for use.

**SetupFcn — Function handle to run once per worker**
function handle
Specify a function handle to 'SetupFcn' to run once per worker before the start of the simulations.

Example: 'SetupFcn',@()simulinkproject('Modelex/Model_example.prj')

**Note** When `buildRapidAcceleratorTarget` is used in the SetupFcn and the model has external inputs specified, either set 'LoadExternalInput' to 'off' or ensure that the specified external input is available on the workers to prevent compilation error.

**CleanupFcn — Function handle to run once per worker after running simulations**
function handle
Specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.
**ManageDependencies — Manage model dependencies**

'off' (default) | 'on'

When `ManageDependencies` is set to **on**, model dependencies are automatically sent to the parallel workers if required. If `ManageDependencies` is set to **off**, explicitly attach model dependencies to the parallel pool.

**UseFastRestart — Use fast restart**

'off' (default) | 'on'

When `UseFastRestart` is set to **on**, simulations run on the workers using fast restart.

When performing a parameter sweep varying properties of a Simscape component (e.g. mass and inertia of a Solid block in Simscape Multibody), specify the Simscape block parameter as run-time configurable. For more information, see “About Simscape Run-Time Parameters” (Simscape).

**Note** When using `parsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

**TransferBaseWorkspaceVariables — Transfer variables to the parallel workers**

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to **on**, variables used in the model and everything defined in the base workspace are transferred to the parallel workers.

**ShowSimulationManager — Starts the Simulation Manager app**

'off' (default) | 'on'

When `ShowSimulationManager` is set to **on**, you can use the Simulation Manager App to monitor simulations.

**StopOnError — Stop simulations on errors**

'off' (default) | 'on'

Setting `StopOnError` to **on** stops the execution of simulations if an error is encountered.
Output Arguments

`simOut` — Simulation object containing logged simulation results

Array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Extended Capabilities

**Automatic Parallel Support**
Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

If you have Parallel Computing Toolbox installed, then when you use `parsim`, MATLAB automatically opens a parallel pool of workers on your local machine. MATLAB runs the simulations across the available workers. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Run Multiple Simulations”.

Introduced in R2017a
**performanceadvisor**

Open Performance Advisor

**Syntax**

`performanceadvisor(model)`

**Description**

`performanceadvisor(model)` opens the Performance Advisor on the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

**Input Arguments**

`model`

A character vector specifying the name or handle to the model or subsystem.

**Examples**

**Open Performance Advisor**

Open Performance Advisor on the vdp example model.

`performanceadvisor('vdp')`
Performance Advisor opens the vdp model and opens Performance Advisor on the model.

**Alternatives**

In the Simulink Editor, in the **Debug** tab, click **Performance Advisor**.

**See Also**

**Topics**

“Improve Simulation Performance Using Performance Advisor”
“Perform a Quick Scan Diagnosis”
“Improve vdp Model Performance”

**Introduced in R2013a**
reload

(Not recommended) Reload project

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

**Syntax**

`reload(proj)`

**Description**

`reload(proj)` reloads the project. Use `reload` when you want to run the project startup shortcuts.

**Examples**

**Reload Project**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

When you want to run the startup shortcuts again, reload the project.

```matlab
reload(proj)
```

**Input Arguments**

`proj` — Project

project object
Project, specified as a project object already created with `simulinkproject` to manipulate a project at the command line.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

`isLoaded | simulinkproject`

**Introduced in R2013a**
removeCategory

(Not recommended) Remove project category of labels

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

removeCategory(proj,categoryName)

**Description**

removeCategory(proj,categoryName) removes a category of labels, categoryName, from the project specified by proj.

**Examples**

**Remove Category**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Create a new category of labels.

```matlab
createCategory(proj,'Engineers','char');
```

Remove the new category of labels.

```matlab
removeCategory(proj,'Engineers');
```
A message appears warning you that you cannot undo the operation. Click **Continue**. You can configure warnings in the Preferences in the Project Tool.

**Input Arguments**

`proj` — Project

`project object`

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

`categoryName` — Name of category

`character vector`

Name of the category to remove, which exists in the project, specified as a character vector.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

removeFile

(Not recommended) Remove file from project

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

removeFile(proj,file)

**Description**

removeFile(proj,file) removes a file from the project proj.

**Examples**

**Remove File from Project**

Open the airframe project and create a project object.

```matlab
sldemo_slproject_airframe;
proj = simulinkproject;
```

Remove a file.

```matlab
removeFile(proj,'models/AnalogControl.slx')
```

Add the file back to the project.
addFile(proj,'models/AnalogControl.slx')

### Input Arguments

**proj** — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a project at the command line.

**file** — Path of file

character vector | file object

Path of the file to remove relative to the project root folder, including the file extension, specified as a character vector or a file object returned by `findFile`. The file must be in the project.

Example: 'models/myModelName.slx'

### Compatibility Considerations

**Simulink project API is not recommended**

_Not recommended starting in R2019a_

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

**Functions**
addFile | findFile | simulinkproject

*Introduced in R2013a*
removeLabel

(Not recommended) Remove label from project

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

removeLabel(category,labelName)
removeLabel(file,categoryName,labelName)
removeLabel(file,labelDefinition)

**Description**

removeLabel(category,labelName) removes the label from the specified category of labels in the currently loaded project.

removeLabel(file,categoryName,labelName) removes the specified label in the category categoryName from the file. Use this syntax to specify category and label by name.

removeLabel(file,labelDefinition) removes the specified label labelDefinition from the file. Before you can remove the label, you need to get the label from the file. Label property or by using findLabel.

**Examples**

**Remove a Label**

Open the airframe project and create a project object.

sldemo_slproject_airframe;
proj = simulinkproject;
Examine the first existing category.

```matlab
cat = proj.Categories(1)
cat = 
    Category with properties:
        Name: 'Classification'
        DataType: 'none'
        LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```matlab
createLabel(cat,'Future');
```

Remove the new label.

```matlab
removeLabel(cat,'Future');
```

## Input Arguments

- **category** — Category of labels
category object

  Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

- **labelName** — Name of label
character vector

  Name of the label to remove, specified as a character vector.

- **file** — File to detach label from
  file object

  File to detach the label from, specified as a file object. You can get the file object by examining the project’s Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

- **categoryName** — Name of category that contains label
  character vector
Name of the category that contains the label to remove, specified as a character vector.

**labelDefinition — Label to detach**

Label definition object

Name of the label to detach, specified as a label definition object returned by the file.Label property or findLabel.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of simulinkproject and related functions, use the currentProject or openProject functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

**See Also**

**Functions**

addLabel | createLabel | findCategory | findLabel | simulinkproject

**Introduced in R2013a**
**replace_block**

Replace blocks in Simulink model

**Syntax**

replBlks = replace_block(sys, current, new)
replBlks = replace_block(sys, Name, Value, new)
replBlks = replace_block(____,'noprompt')

**Description**

replBlks = replace_block(sys, current, new) replaces the blocks current in the model sys with blocks of type new. You can use a block from a Simulink library or from another model as the replacement block.

Load the model sys before using this function. The function prompts you to select the blocks you want to replace from a list of blocks that match the current argument.

**Tip** Save the model before using this command.

replBlks = replace_block(sys, Name, Value, new) replaces the blocks that match the block parameters specified by the Name, Value pair arguments. You can also use find_system Name, Value pairs to qualify the search for blocks to replace.

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

With the replace_block function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-112 and “Block-Specific Parameters” on page 6-132.

To specify additional information about the search for blocks to replace, you use find_system Name, Value pairs before the block parameters. For example, you can use
CaseSensitive,'off' to make the search for blocks case insensitive or 'FollowLinks','on' to follow links into library links. See find_system for that list of Name,Value pairs.

replBlks = replace_block(___,'noprompt') replaces the blocks without prompting you to select them from a dialog box.

Examples

Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

load_system('vdp');

Replace Gain blocks with Integrator blocks.

RepNames = replace_block('vdp','Gain','Integrator');

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu selected in the dialog box, click OK.

Replace Scope blocks with To Workspace blocks.

RepNames = replace_block('vdp','Scope','simulink/Sinks/To Workspace');

A dialog box prompts you to select the blocks you want to replace.

With vdp/Scope selected in the dialog box, click OK.

Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the Unlocked subsystem of the sldemo_clutch model. Replace blocks whose Gain parameter is set to bv.

Load the model sldemo_clutch.
load_system('sldemo_clutch');

In the 'Unlocked' subsystem, replace blocks whose Gain value is bv with Integrator blocks.

replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');

A dialog box prompts you to select the blocks to replace.

With sldemo_clutch/Unlocked/VehicleDamping selected in the dialog box, click OK.

**Replace Blocks Without Dialog Box**

Load the model f14.

load_system('f14')

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

repl = replace_block('f14','Gain','Integrator','noprompt')

repl = 13x1 cell array
   {'f14/Aircraft...'}    }
   {'f14/Aircraft...'}    }
   {'f14/Aircraft...'}    }
   {'f14/Aircraft...'}    }
   {'f14/Controller/Gain'}
   {'f14/Controller/Gain2'}
   {'f14/Controller/Gain3'}
   {'f14/Gain'}
   {'f14/Gain1'}
   {'f14/Gain2'}
   {'f14/Gain5'}
   {'f14/Nz pilot...'}    }
   {'f14/Nz pilot...'}    }

2-469
Use find_system Pairs with replace_block

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gca, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

Input Arguments

**sys — Model or subsystem whose blocks to replace**

character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: 'vdp', 'sldemo_fuelsys/fuel_rate_control'

**current — Type of block to replace**

BlockType value | MaskType value

Type of block to replace, specified as a BlockType or MaskType value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gca,'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gca,'MaskType')
```

**new — Block to replace current blocks**

BlockType value | MaskType value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- BlockType value of the replacement block. Specifying this value uses a library block as the replacement block.
- MaskType value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, 'simulink/Sinks/To Workspace'. Hover over the block in the library to see the library path.
• Block path name of a block from a different model, for example, 'vdp/Mu'. Use this value to reuse an instance of a block from another model in your model.

Output Arguments

replBlks — Blocks returned by the current argument

cell array of character vectors

Blocks returned by the current argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

“Block-Specific Parameters” on page 6-132

Introduced before R2006a
save_system

Save Simulink model

Syntax

filename = save_system
filename = save_system(sys)
filename = save_system(sys,newsys)
filename = save_system(sys,newsys,Name,Value)

Description

filename = save_system saves the current top-level model. If the model was not previously saved, save_system creates a file in the current folder.

To save a subsystem, instead use Simulink.SubSystem.copyContentsToBlockDiagram to copy the subsystem contents to a new model. You can then save that model using save_system. See Simulink.SubSystem.copyContentsToBlockDiagram.

If you set the model UpdateHistory property to UpdateHistoryWhenSave, no dialog box prompt appears when you use save_system to save the model. If you want to update the comment, use the 'ModifiedComment' parameter with set_param before saving, for example:

set_param('mymodel','ModifiedComment','Here is my comment.')

filename = save_system(sys) saves the model sys. The model must be open or loaded.

filename = save_system(sys,newsys) saves the model to a new file newsys. If you do not specify an extension, then save_system uses the file format specified in your Simulink preferences.

filename = save_system(sys,newsys,Name,Value) saves the system with additional options specified by one or more Name,Value pair arguments. To use Name,Value pairs without saving to a new file, use [] for newsys.
Examples

Save Named Model

Create a model.

\begin{verbatim}
new_system('newmodel')
\end{verbatim}

Save the model.

\begin{verbatim}
save_system('newmodel')
\end{verbatim}

Save Model with Another Name

Open the model vdp. Save it to a model named myvdp in the current folder. Without a file
extension, the function saves the model using the format specified in your Simulink
preferences.

\begin{verbatim}
open_system('vdp')
save_system('vdp','myvdp')
\end{verbatim}

After you save the model by another name, the model is no longer open under its original
name. Open vdp again and save it as an .mdl file in the current folder.

\begin{verbatim}
open_system('vdp')
save_system('vdp','mynewvdp.mdl')
\end{verbatim}

Return Error If Name Exists

Save a model with a new name and return an error if something with this name exists on
the MATLAB path. In this case, save_system displays an error because max is the name
of a MATLAB function. The model is not saved.

\begin{verbatim}
open_system('vdp')
save_system('vdp','max','ErrorIfShadowed',true)
\end{verbatim}

Error using save_system (line 38)
The model 'vdp' cannot be saved with the new name 'max', because this name is
shading another name on the MATLAB path or in the workspace. Choose another name, or do not use the option 'ErrorIfShadowed'

Save Model with Options

Suppose that you have a model named mymodel. Open the model and save it to a model named newmodel. Also save the model workspace, break links to user-defined library blocks, and overwrite if the file has changed on disk,

```matlab
open_system('mymodel')
save_system('mymodel','newmodel','SaveModelWorkspace',true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)
```

Save Model to Same Name and Use Options

Save the model mymodel, breaking links to user-defined library blocks in the model.

```matlab
save_system('mymodel',[],'BreakUserLinks',true)
```

Input Arguments

**sys — Name of model to save**
character vector | cell array of character vectors | string array | handle | array of handles

Name of model to save, specified as a character, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

**newsys — File to save to**
character vector | cell array of character vectors | string array | []

File to save to, specified as a character vector, cell array of character vectors, string array, or, to use Name, Value pairs without changing the file name, []. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, `save_system` saves to the file format specified in your Simulink preferences. Possible model extensions are .slx and .mdl. With the 'ExportToXML' option, use the extension .xml.

For information on rules for naming models, see “Model Names”.

2-474
**Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example:
```
save_system('mymodel', 'newmodel', 'SaveModelWorkspace', true, 'BreakUserLinks', true, 'OverwriteIfChangedOnDisk', true)
```

**AllowPrompt — Allow dialog box prompts**

`false` (default) | `true` | `'on'` | `'off'`

Option to allow dialog box prompts, specified as `true`, `false`, `'on'`, or `'off'`. By default, warnings and error messages appear at the command line.

**BreakAllLinks — Replace links to library blocks**

`false` (default) | `true` | `'on'` | `'off'`

Option to, in the saved file, replace links to library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects user-defined blocks and Simulink library blocks.

**Caution** The `'BreakAllLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink. For example:

- Any masks on top of library links to Simulink S-functions do not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library do not upgrade to the new subsystem behavior.
- Any broken links prevent the library forwarding mechanism from upgrading the link.

If you saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks. Then upgrade the Simulink blocks to their current versions.

**BreakUserLinks — Replace links to user-defined blocks**

`false` (default) | `true` | `'on'` | `'off'`
Option to, in the saved file, replace links to user-defined library blocks with copies of the library blocks, specified as true, false, 'on', or 'off'.

**BreakToolboxLinks — Replace links to built-in library block**
false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to built-in library blocks with copies of the library blocks, specified as true, false, 'on', or 'off'. This option affects Simulink library blocks and blocks from libraries supplied with MathWorks toolboxes or blocksets.

**ErrorIfShadowed — Return an error if name exists**
false (default) | true | 'on' | 'off'

Option to return an error if the new name exists on the MATLAB path or workspace, specified as true, false, 'on', or 'off'.

**ExportToXML — Export model to XML format**
false (default) | true | 'on' | 'off'

Option to export the model to a file in a simple XML format, specified as true, false, 'on', or 'off'. Specify the full name of the file, including the .xml extension. The block diagram in memory does not change and no callbacks execute. Use this option without any other Name,Value pair arguments. This option warns and will be removed in a future release.

Example: `save_system('mymodel','exportfile.xml','ExportToXML',true)`

**ExportToVersion — MATLAB release name to export to**
character vector | string scalar

MATLAB release name to export to, specified in either of these forms (not case sensitive). You can export to seven years of previous releases.

- Release name, for example, 'R2013B', 'R2016B'
- Release name, followed by an underscore and then the extension, for example, 'R2016A_SLX', 'R2014A_MDL'. If you do not specify an extension, you export to the file format specified in your Simulink preferences.

`save_system` exports the system such that the specified Simulink version can load it. If the system contains functionality not supported by the specified Simulink version, the command removes the functionality in the exported file. It also replaces unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the exported system might generate different results.
Alternatively, use `Simulink.exportToVersion` or, interactively, the Export to Previous Version dialog box.

**OverwriteIfChangedOnDisk — Overwrite file**

false (default) | true | 'on' | 'off'

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as true, false, 'on', or 'off'. By default, if the file changed on disk since the model was loaded, `save_system` displays an error to prevent the changes on disk from being overwritten.

You can control whether `save_system` displays an error if the file has changed on disk using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

**SaveDirtyReferencedModels — Save referenced models with unsaved changes**

false (default) | true | 'on' | 'off'

Option to save referenced models that contain unsaved changes while also saving the model, specified as true, false, 'on', or 'off'. By default, attempting to save a model that contains unsaved referenced models return an error.

**SaveModelWorkspace — Save model workspace**

false (default) | true | 'on' | 'off'

Option to save the contents of the model workspace, specified as true, false, 'on', or 'off'. The model workspace **DataSource** must be a MAT-file. If the data source is not a MAT-file, `save_system` does not save the workspace. See “Specify Source for Data in Model Workspace”.

**Output Arguments**

**filename — Name of saved file**

character vector | cell array of character vectors

Full name of saved file, returned as a character vector or a cell array of character vectors.

Simulink.exportToVersion | close_system | new_system | open_system

Topics
“Save a Model”

Introduced before R2006a
**Schedule Editor**

View and edit the schedule of model components (partitions)

**Description**

The Schedule Editor is a scheduling tool that represents the components in the model known as partitions, the data connections between them, and the execution order of those partitions.

Partitions are the components of the model that execute independently as tasks. The data connections between the partitions show the flow of the data between those partitions. The scheduling of these partitions is based on the rates and the events in the model. This schedule is shown in the **Execution Order** table in the Schedule Editor.

Using the Schedule Editor, you can:

- Create partitions and specify their execution order.
- Edit and analyze the schedule of the executable partitions without disturbing the structure of the model.
- Visualize how Simulink executes partitions.

Changes made in the Schedule Editor affect both, simulation and code generation.

**Using the Schedule Editor**

The Schedule Editor consists of two parts representing two different views of partitions in the model:

- A graph that shows the partitions and the data connections between them.
• A table that shows the order in which the partitions execute.

<table>
<thead>
<tr>
<th>Order</th>
<th>Name</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>D1</td>
<td>0.1</td>
</tr>
<tr>
<td>2</td>
<td>Component.D1</td>
<td>0.1</td>
</tr>
<tr>
<td>3</td>
<td>Component.P1</td>
<td>0.1</td>
</tr>
<tr>
<td>4</td>
<td>Component.P2</td>
<td>0.1</td>
</tr>
<tr>
<td>5</td>
<td>Component.D2</td>
<td>0.2</td>
</tr>
</tbody>
</table>

Changing one of the views impacts the other.

To use the Schedule Editor, select **View > Schedule Editor**. If the model is already partitioned, you can open the Schedule Editor by clicking the badge, which appears above the blocks. To see the default partitions present in the model in the Schedule Editor, update the diagram by clicking the icon on the toolstrip or by selecting **Ctrl + D**. As you create partitions in the model and update the diagram, partitions appear in the Schedule Editor.

To check how the partitions map to the model, right-click the partitions and select **Show Source**. The Simulink model window appears with every block corresponding to the partition highlighted.
Execution Order

The Execution Order shows the order in which the partitions execute. To change the execution order, you can drag and drop the partitions. You can also use the Up and Down arrows on the toolstrip. Partitions are sorted based on their rates. You can only reorder the partitions with the same rate. Clicking a partition in the Execution Order, highlights the corresponding partition in the graph. On changing the execution order, the connections that are affected by this specified change get highlighted.

<table>
<thead>
<tr>
<th>Order</th>
<th>Name</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>D1</td>
<td>0.1</td>
</tr>
<tr>
<td>3</td>
<td>Component.P2</td>
<td>0.1</td>
</tr>
<tr>
<td>2</td>
<td>Component.D1</td>
<td>0.1</td>
</tr>
<tr>
<td>4</td>
<td>Component.U2</td>
<td>0.2</td>
</tr>
<tr>
<td>5</td>
<td>Component.P1</td>
<td>0.2</td>
</tr>
</tbody>
</table>

Connections

Connections between the partitions show data dependencies. You can right-click the connections between the partitions to change the constraints on data connections. The different types of connections illustrate how the partitions behave with each other.

The types of connections are:

- **Dependency** — Indicates that the source always runs before the destination. The dependency connection is a solid line.

- **Delay** — Indicates that the destination runs before the source. When the destination runs before the source, a scheduling delay is introduced. The delay connection is a dashed line.

You can put these types of constraints on connections:
• **Allow Delay** — Inserts a delay when required. When you specify this constraint for a connection, Simulink inserts a delay for that connection only when necessary. The unlock icon on the connections signifies an allowed delay. When you select this constraint on a connection, Simulink prefers these connections to be turned into a delay if necessary over other connections.

This constraint is displayed as one of these options.

![Unlock Icon](image)

• **Prevent Delay** — Prevents delay from being inserted in the connection. When you specify this constraint for a connection, Simulink ensures that the connection is a dependency. The lock icon on the connection indicates that the connection is locked as a dependency and is not changed to a delay.

![Lock Icon](image)

**Open the Schedule Editor**

• Simulink: In the **View**, select **Schedule Editor**.
• Simulink model: Click the badge on the partitioned blocks.
• Keyboard shortcut: Select **Alt+V+S**.

**Examples**

• “Schedule an Export-Function Model Using the Schedule Editor”
• “Schedule a Rate-Based Model Using the Schedule editor”
Parameters

Manage Partitions

**Partition Name — Name of the partitions**
character vector

Name of the partitions created. Double-click the name to edit and use the enter key to save the partition name.

**Sample Time — Sample time for partitions to execute**
discrete value | variable

Sample time at which the partitions execute. The sample time is a discrete value or a defined variable that contains a discrete value.

Property Inspector

**Hit times — Times for aperiodic partitioned to execute**
vector

Times at which the aperiodic partitions execute, specified as a vector of discrete values.

**Connections — Data connections between partitions**
Auto (default) | Delay | Dependency | Prevent Delays | Allow Delays

Dependency between the partitions is shown as a solid line. A delay between the partitions is shown as a dashed line. The arrow tail and head denote the source and destination, respectively.

Specify constraints on the connections by right-clicking the lines and selecting the constraint type.

More About

Execution Order

By default, the **Execution Order** table is expanded. **Execution Order** shows the order of partition execution. Edit the order by dragging the partitions or using the **Up** and **Down** arrows on the toolstrip.
Manage Partitions

By default, the Manage Partitions panel is collapsed. Expand the panel to create partitions, edit names and/or sample times of the existing partitions, and remove existing partitions. Changes made in the Manage Partitions panel take effect after updating the diagram.

Property Inspector

The Property Inspector shows information about the selected partition. It shows the rate at which the partition executes and the connections on that partition. Enter the Hit times when you select an aperiodic partition in the Property Inspector.

Arrange

The Arrange button organizes the partition graph.

Layout

By default, the Execution Order panel and the Property Inspector panel are expanded. From the Layout drop-down, select the preferred panels to be expanded as per preference. Clearing the panels collapses them.

Introduced in R2019a
set_param

Set system and block parameter values

Syntax

set_param(Object,ParameterName,Value,...ParameterNameN,ValueN)

Description

set_param(Object,ParameterName,Value,...ParameterNameN,ValueN) sets the parameter to the specified value on the specified model or block object.

When you set multiple parameters on the same model or block, use a single set_param command with multiple pairs of ParameterName, Value arguments, rather than multiple set_param commands. This technique is efficient because using a single call requires evaluating parameters only once. If any parameter names or values are invalid, then the function doesn’t set any parameters.

Tips:

• If you make multiple calls to set_param for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use getSimulinkBlockHandle to get a block handle.
• If you use matlab -nodisplay to start a session, you cannot use set_param to run your simulation. The -nodisplay mode does not support simulation using set_param. Use the sim command instead.
• After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

    set_param(model,'SimulationCommand','Update')

For parameter names, see:

• “Model Parameters” on page 6-2
• “Block-Specific Parameters” on page 6-132
• “Common Block Properties” on page 6-112

Examples

Set Model Configuration Parameters for a Model

Open vdp and set the Solver and StopTime parameters.

```matlab
vdp
set_param('vdp','Solver','ode15s','StopTime','3000')
```

Set Model Configuration Parameters for Current Model

Open a model and set the Solver and StopTime parameters. Use bdroot to get the current top-level model.

```matlab
vdp
set_param(bdroot,'Solver','ode15s','StopTime','3000')
```

Set a Gain Block Parameter Value

Open vdp and set a Gain parameter value in the Mu block.

```matlab
vdp
set_param('vdp/Mu','Gain','10')
```

Set Position of Block

Open vdp and set the position of the Fcn block.

```matlab
vdp
set_param('vdp/Fcn','Position',[50 100 110 120])
```
Set Position of Block Using a Handle

Set the position of the Fcn block in the vdp model.

Use `getSimulinkBlockHandle` to load the vdp model if necessary (by specifying true), and get a handle to the Fcn block. If you make multiple calls to `set_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```matlab
cfcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use the block handle with `set_param` to set the position.

```matlab
set_param(fcnblockhandle,'Position',[50 100 110 120])
```

**Input Arguments**

**Object — Name or handle of a model or block**

- character vector | string scalar | handle

Handle or name of a model or block, specified as a numeric handle or a character vector. A numeric handle must be a scalar. You can also set parameters of lines and ports, but you must use numeric handles to specify them.

**Tip** If you make multiple calls to `set_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Example: 'vdp/Fcn'
**ParameterName — Model or block parameter name**
character vector | string scalar

Model or block parameter name, specified as a character vector or a string scalar. Some parameter names are case sensitive.
Example: 'Solver'
Example: 'SimulationCommand'
Example: 'Position'

**Value — Value of the specified parameter**
any data type, depending on the parameter

Model or block parameter value, specified in the format determined by the parameter type. Some parameter values are case sensitive. Values are often character vectors, but they can also be numeric, arrays, and other types. Many block parameter values are specified as character vectors, but two exceptions are these parameters: Position, specified as a vector, and UserData, which can be any data type.

**Introduced before R2006a**
**setActiveConfigSet**

Specify model's active configuration set or configuration reference

**Syntax**

```
setActiveConfigSet(model, configObjName)
```

**Arguments**

- **model**
  - The name of an open model, or `gcs` to specify the current model
- **configObjName**
  - The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

**Description**

`setActiveConfigSet` specifies the active configuration set or configuration reference (configuration object) of `model` to be the configuration object specified by `configObjName`. If no such configuration object is attached to the model, an error occurs. The previously active configuration object becomes inactive.

**Examples**

The following example makes `DevConfig` the active configuration object of the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
setActiveConfigSet(gcs, 'DevConfig');
```

Introduced before R2006a
sfix

Create Simulink.NumericType object describing signed fixed-point data type

Syntax

\[ a = \text{sfix(WordLength)} \]

Description

\text{sfix(WordLength)} \text{ returns a Simulink.NumericType object that describes a signed fixed-point number with the specified word length and unspecified scaling.}

\textbf{Note} \text{sfix is a legacy function. In new code, use \text{fixdt} instead. In existing code, replace sfix(WordLength) with fixdt(1,WordLength).}

Examples

Define a 16-bit signed fixed-point data type.

\[ a = \text{sfix(16)} \]

\[ a = \]

\text{NumericType with properties:}

\begin{itemize}
  \item \text{DataTypeMode: 'Fixed-point: unspecified scaling'}
  \item \text{Signedness: 'Signed'}
  \item \text{WordLength: 16}
  \item \text{IsAlias: 0}
  \item \text{DataScope: 'Auto'}
  \item \text{HeaderFile: ''}
  \item \text{Description: ''}
\end{itemize}
See Also
Simulink.NumericType | fixdt | float | sfrac | sint | ufix | ufrac | uint

Introduced before R2006a
sfrac

Create Simulink.NumericType object describing signed fractional data type

Syntax

a = sfrac(WordLength)
a = sfrac(WordLength, GuardBits)

Description

sfrac(WordLength) returns a Simulink.NumericType object that describes the data type of a signed fractional data type with a word size given by WordLength.

sfrac(WordLength, GuardBits) returns a Simulink.NumericType object that describes the data type of a signed fractional number. The total word size is given by WordLength with GuardBits bits located to the left of the binary point.

The most significant (leftmost) bit is the sign bit. The default binary point for this data type is assumed to lie immediately to the right of the sign bit. If guard bits are specified, they lie to the left of the binary point and to right of the sign bit. For example, the structure for an 8-bit signed fractional data type with 4 guard bits is:

Note sfrac is a legacy function. In new code, use fixdt instead. In existing code, replace sfrac(WordLength,GuardBits) with fixdt(1,WordLength, (WordLength-1-GuardBits)) and sfrac(WordLength) with fixdt(1,WordLength,(WordLength-1)).
Examples

Define an 8-bit signed fractional data type with 4 guard bits. Note that the range of this data type is $-2^4 = -16$ to $(1 - 2^{(1 - 8)})2^4 = 15.875$.

```matlab
a = sfrac(8,4)
```

```
NumericType with properties:

    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Signed'
    WordLength: 8
    FractionLength: 3
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

Introduced before R2006a
**showblockdatatypetable**

Display HTML page of Simulink block data type support

**Syntax**

showblockdatatypetable

**Description**

showblockdatatypetable displays an HTML page of the Simulink block data type support. This table that lists the data types that Simulink blocks support.

**Examples**

**Display Support of Simulink Block Data Types**

Display an HTML page of the Simulink block data type support.

showblockdatatypetable

**Tips**

To open the Block Support Table using a block, double-click the Block Support Table block in the block library or add it to a model and then double-click it.

**See Also**

Block Support Table

**Topics**

“Data Types Supported by Simulink”
Introduced before R2006a
showunitslist

Show built-in units, physical quantities, and unit systems supported by Simulink

Syntax

showunitslist

Description

showunitslist opens a web browser that contains the list of built-in units, physical quantities, and unit systems supported by Simulink.

Examples

Show Built-in Units, Physical Quantities, and Unit Systems

Show built-in units, physical quantities, and unit systems supported by Simulink.

showunitslist

This function opens a web browser displaying the allowed units.

Topics

“Unit Specification in Simulink Models”

Introduced in R2016a
signalbuilder

(Not recommended) Create and access Signal Builder blocks

**Syntax**

```matlab
[time, data] = signalbuilder(block)
[time, data, signames] = signalbuilder(block)
[time, data, signames, groupnames] = signalbuilder(block)

block = signalbuilder(path,'create',time,data)
block = signalbuilder(path,'create',time,data,signames,groupnames)
block = signalbuilder(path,'create',time,data,signames,groupnames, vis)
block = signalbuilder(path,'create',time,data,signames,groupnames, vis,pos)
block = signalbuilder(path,'create',time,data,signames,groupnames, vis,pos,{openui openmodel})

block = signalbuilder(block,'appendgroup',time,data,signames, groupnames)
signalbuilder(block,'appendgroup',ds)
signalbuilder(block,'appendgroup', [ds1 ...dsN])
signalbuilder(block,'appendsignal',time,data,signames)
signalbuilder(block,'showsignal',signal,group)
signalbuilder(block,'hidesignal',signal, group)

[time, data] = signalbuilder(block,'get',signal,group)
ds = signalbuilder(block,'get',group)
[ds, ...dsN] = signalbuilder(block,'get',group)
signalbuilder(block,'set',signal,group,time,data)
signalbuilder(block,'set',group,ds)
signalbuilder(block,'set',group,[ds1 ...dsN])

index = signalbuilder(block,'activegroup')
```
[index, activeGroupLabel] = signalbuilder(block,'activegroup')
signalbuilder(block,'activegroup',index)
signalbuilder(block,'annotategroup')
signalbuilder(block,'print',config,printArgs)
figh = signalbuilder(block,'print',config,'figure')

**Description**

\[\text{[time, data]} = \text{signalbuilder(block)}\] returns the time and data of the Signal Builder block, block.

\[\text{[time, data, signames]} = \text{signalbuilder(block)}\] returns signal names, signames, and time and data.

\[\text{[time, data, signames, groupnames]} = \text{signalbuilder(block)}\] returns the signal names, signames, and group names, groupnames, and time and data.

\[\text{block = signalbuilder(path,'create',time, data)}\] creates a new Signal Builder block at path with specified time and data. Signal and group names are default.

\[\text{block = signalbuilder(path,'create',time, data, signames, groupnames)}\] creates a new Signal Builder block at path with specified time and data, signal names, and group names.

\[\text{block = signalbuilder(path,'create',time, data, signames, groupnames, vis)}\] creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix vis.

\[\text{block = signalbuilder(path,'create',time, data, signames, groupnames, vis,pos)}\] creates a new Signal Builder block and sets the block position to pos.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

\[\text{block = signalbuilder(path,'create',time, data, signames, groupnames, vis,pos,\{openui openmodel\})}\] creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.
block = signalbuilder(block,'appendgroup',time,data,signames, groupnames) appends new groups (groupnames) containing signames to the Signal Builder block, block. The time and data arguments must have the same number of signals as the existing block.

signalbuilder(block,'appendgroup',ds) appends one dataset.

signalbuilder(block,'appendgroup',[ds1 ...dsN]) appends N datasets.

signalbuilder(block,'appendsignal',time,data,signames) appends new signals to all signal groups in the Signal Builder block, block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide time and data arguments for either one group (append the same information to all groups) or different time and data arguments for different groups.

signalbuilder(block,'showsignal',signal,group) makes signals that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created.

signalbuilder(block,'hidesignal',signal, group) makes signals, signal, hidden from the Signal Builder block. By default, all signals are visible when created.

[time,data] = signalbuilder(block,'get',signal,group) gets the time and data values for the specified signal(s) and group(s).

ds = signalbuilder(block,'get',group) gets one or more datasets for one requested Signal Builder group. r gets N datasets for N requested Signal Builder groups.

[ds, ...dsN] = signalbuilder(block,'get',group) gets N datasets for N requested Signal Builder groups.

signalbuilder(block,'set',signal,group,time,data) sets the time and data values for the specified signal and group. Use empty values of time and data to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

signalbuilder(block,'set',group,ds) sets one dataset for the requested Signal Builder group. Specifying an empty dataset deletes the groups specified in group.
signalbuilder(block, 'set', group, [ds1 ... dsN]) sets N datasets for N requested groups.

index = signalbuilder(block, 'activegroup') gets the index of the active group.

[index, activeGroupLabel] = signalbuilder(block, 'activegroup') gets the label value of the active group.

signalbuilder(block, 'activegroup', index) sets the active group to indexed active group.

signalbuilder(block, 'annotategroup') controls the display of the current group name on the mask of the Signal Builder block. 'annotategroup' takes one of these values:

- 'on' — Shows the current group name
- 'off' — Hides the current group name

signalbuilder(block, 'print', config, printArgs) prints the currently active signal group or the signal group that config specifies. Use the config to customize the printed appearance of a signal group.

figh = signalbuilder(block, 'print', config, 'figure') prints the currently active signal group or the signal group that config specifies to a new hidden figure handle, figh.

**Examples**

**Create Signal Builder Block**

Create a Signal Builder block in a new model editor window.

block = signalbuilder([], 'create', [0 5], [[2 2]; [0 2]]);

Get Signal Builder data from this block.

[time, data, signames, groupnames] = signalbuilder(block)

time =

2x1 cell array
data =
{1×2 double}  
{1×2 double}

data =
2×1 cell array
{1×2 double}  
{1×2 double}

signames =
1×2 cell array
{'Signal 1'} {'Signal 2'}

groupnames =
1×1 cell array
{'Group 1'}

The Signal Builder block contains two signals in one group. Alter the second signal in the group.

signalbuilder(block, 'set', 2, 1, [0 5], [2 0]);

To make this same change using the signal name and group name:

signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])

Create Signal Builder Block and Delete Group

Create a Signal Builder block with two signal groups and delete one of the groups.

block = signalbuilder([], 'create', [0 2], {{0 1},[1 0]});

The Signal Builder block has two groups, each of which contains a signal.

To delete the second group, also delete its signal.
Create Signal Builder Block with Two Groups

Create a Signal Builder block with two groups, each of which contains three signals.

```matlab
block = signalbuilder([], 'create', [0 1], ...
    {{[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]}});
```

Create Signal Builder Block and Append Signal Groups

Create a Signal Builder block in a new model editor window.

```matlab
block = signalbuilder([], 'create', {
    [0 10],[0 20]
}, {
    [6 -6],...
    [2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```matlab
block = signalbuilder(block, 'appendgroup', [0 30], [10 -10]);
```

Append a new signal, sig3, to all groups.

```matlab
signalbuilder(block, 'appendsignal', [0 30], [0 10], 'sig3');
```

Create Signal Builder Block and Delete Signal Group

Create a Signal Builder block in a new model editor window.

```matlab
time = [0 1];
data = {{[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]};
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.
Create Signal Builder Block and Hide Signal

Create a Signal Builder block in a new model editor window and hide signal.

```matlab
block = signalbuilder([], 'create', [0, 5], {[2 2];[0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, Signal 1.

```matlab
signalbuilder(block,'hidesignal','Signal 1', 'Group 1')
```

Signal 1 is no longer visible in the Signal Builder block.

Make Signal 1 visible again.

```matlab
signalbuilder(block,'shows signal', 'Signal 1', 'Group 1')
```

Create Two Signal Builder Blocks

Create two Signal Builder blocks in new model editor windows.

```matlab
block = signalbuilder([], 'create', [0, 5], {[2 2];[0 2]});
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1, 2], {[1 2];[0 10]});
```

Get a dataset for group 1 of block.

```matlab
ds=signalbuilder(block,'get',1);
```

Get a dataset for group 1 of block1.

```matlab
ds1=signalbuilder(block1,'get',1);
```

Set the dataset for group 1 of block to ds1.

```matlab
signalbuilder(block,'set',1,ds1);
```

Append the original dataset for group 1 of block (ds) to block.

```matlab
signalbuilder(block,'appendgroup',ds);
```
To create a third group in `block`, append `ds1` to the end of the groups in `block`.

```matlab
signalbuilder(block,'appendgroup',ds1);
```

## Input Arguments

**block — Signal Builder block path or handle**

[] (default) | block handle | block name

Signal Builder block handle or name. If you specify [] for this argument, the block has the path 'untitled/Signal Builder'.

Example: 'untitled/Signal Builder'

Example: `block_handle = gcbh`

Data Types: char | string

**time — Time**

row vector | column cell vector | row cell vector | cell matrix

Specify `time` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Time Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 signal, 1 group</td>
<td>Row vector of break points.</td>
</tr>
<tr>
<td>&gt;1 signal, 1 group</td>
<td>Column cell vector where each element corresponds to a separate signal and contains a row vector of points.</td>
</tr>
<tr>
<td>1 signal, &gt;1 group</td>
<td>Row cell vector where each element corresponds to a separate group and contains a row vector of points.</td>
</tr>
<tr>
<td>&gt;1 signal, &gt;1 group</td>
<td>Cell matrix where each element (i, j) corresponds to signal i and group j.</td>
</tr>
</tbody>
</table>
Dependencies

If `signalbuilder` is called for an existing block, the `time` argument must have the same number of signals as the existing block.

Data Types: double

**data — Data**

`row vector | column cell vector | row cell vector | cell matrix`

Specify `data` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Time/Data Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 signal, 1 group</td>
<td>Row vector of break points.</td>
</tr>
<tr>
<td>&gt;1 signal, 1 group</td>
<td>Column cell vector where each element corresponds to a separate signal and contains a row vector of points.</td>
</tr>
<tr>
<td>1 signal, &gt;1 group</td>
<td>Row cell vector where each element corresponds to a separate group and contains a row vector of points.</td>
</tr>
<tr>
<td>&gt;1 signal, &gt;1 group</td>
<td>Cell matrix where each element (i, j) corresponds to signal i and group j.</td>
</tr>
</tbody>
</table>

Data Types: double

**config — Configuration structure name**

`structure name`

Configuration structure containing instructions to display signal group information on the block mask. Set up the structure with one or more of these fields before you print.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupIndex</td>
<td>Scalar specifying index of signal group to print</td>
<td>2</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Example Value</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>timeRange</td>
<td>Two-element vector specifying the time range to print (must not exceed the block's time range)</td>
<td>[3 6]</td>
</tr>
<tr>
<td>visibleSignals</td>
<td>Vector specifying index of signals to print</td>
<td>[1 2]</td>
</tr>
<tr>
<td>yLimits</td>
<td>Cell array specifying limits for each signal's y-axis</td>
<td>{[-1 1], [0 1]}</td>
</tr>
<tr>
<td>extent</td>
<td>Two-element vector of the form: [width, height] specifying the dimensions (in pixels) of the area in which to print the signals</td>
<td>[500 300]</td>
</tr>
<tr>
<td>showTitle</td>
<td>Logical value specifying whether to print a title: true (1) prints the title</td>
<td>false</td>
</tr>
</tbody>
</table>

For example, to print just group 2 using a configuration structure, configstruct, set up the structure as follows. You do not need to specify any other fields.

```matlab
configstruct.groupIndex=1
```

Example: configstruct

Data Types: char | string

'create' — Create directive

'create'

Create new Signal Builder block.

Data Types: char | string

signames — Signal names

<table>
<thead>
<tr>
<th>Signal 1 (default)</th>
<th>' '</th>
<th>{}</th>
<th>character vector</th>
<th>cell array of character vectors</th>
</tr>
</thead>
</table>

Signal names, specified as ' ', {}, a character vector, or cell array of character vectors.

If you specify a value of ' ' or {}, the function uses existing signal names for the new groups.

Data Types: char | string
**groupnames — Signal group names**
Group 1 (default) | character vector | cell array of character vectors

Group names, specified as a character vector or cell array of character vectors.
Data Types: char | string

**path — Block path**
[] (default) | full block path

Block path, specified as full block path. To create a Signal Builder block in a new model, `untitled`, with the name Signal Builder, specify `[]`.
Data Types: char | string

**vis — Signal visibility**
matrix

Signal visibility, specified as a matrix. The Signal Builder block displays signals in each group based on the values of the matrix `vis`. This matrix must be the same size as the cell array, `data`. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the `vis` parameter for all signals to 0, the first signal is still visible.
Data Types: double

**pos — Block position in model**
[0 0] (default) | [x y right bottom]

Block position in model, specified as `[x y right bottom]`.
Data Types: double

**openui — Open Signal Builder block dialog box**
0 (default) | 1

Open Signal Builder block dialog upon creation by `signalbuilder` function, specified as 0 or 1.
Data Types: double

**openmodel — Open model**
1 (default) | 0

Open model upon creation by `signalbuilder` function, specified as one of:
0 — Load the model but do not open it.
1 — Open the model.

Data Types: double

'appendsignal' — Append signals
'appendsignal' (default)

Append new signals to all signal groups in the Signal Builder block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block. You cannot append signals to a subset of the groups.

Data Types: char | string

'appendgroup' — Append new signal group
'appendgroup'

Append new signal groups whose number of time and signal elements are the same as existing signal groups in the Signal Builder block.

For the showsignal and hidesignal methods, if you do not specify a value for the group argument, signalbuilder applies the operation to all the signals and groups.

Data Types: char

'set' — Set values
'set'

Set values based on input arguments.

• time and data — Return time and data values.
• ds — Return Simulink.SimulationData.Dataset object(s).

Data Types: char

'get' — Get values
'get'

Get values based on output arguments.

• [time, data] — Return time and data values.
• `[ds, ...dsN]` — Return `Simulink.SimulationData.Dataset` object(s).

  Data Types: `char` | `string`

  `'showsignal'` — Make signal visible
  `'showsignal'`

  Make one or more signals visible in a signal group. If no group is specified, all the signals and groups are visible.

  Data Types: `char` | `string`

  `'hidesignal'` — Hide signal
  `'hidesignal'`

  Hide one or more signals in a signal group. If no group is specified, all the signals and groups are hidden.

  Data Types: `char`

  **ds — Dataset**
  
  `timeseries` data elements | 1-D scalar data value at each time | nonempty data and/or time | empty values

  Dataset of timeseries elements, specified as a `Simulink.SimulationData.Dataset` object.

  Data Types: `double`

  **ds1 ...dsN — Multiple datasets**
  
  vectors of `timeseries` data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time

  One or more datasets of timeseries elements, specified as `Simulink.SimulationData.Dataset` objects.

  Example: `[ds1 ds2 ds3]`

  Data Types: `double`

  **signal — Signal**
  
  signal name | scalar index | array of signal indices

  Signal, specified as a signal name, scalar index, or array of signal indices.
Data Types: char | double | string

**group — Signal group**
group name | scalar index | array of group indices

Signal group, specified as a group name, scalar index, or array of group indices.
Data Types: char | double | string

**index — Group index**
active group index

Active signal group index.
Data Types: double

'activegroup' — Get active group
'activegroup'

Get currently active signal group.
Data Types: char | string

'annotategroup' — Display active signal group name
'on' (default) | 'off'

Display active signal group name on Signal Builder block mask:
- 'on' — Display active signal group names on block mask.
- 'off' — Do not display active signal group names on block mask.

Data Types: char | string

'print' — Print signal group
'print'

Print signal group.
Data Types: char | string

**printArgs — Configure print options**
[] | print function arguments

Configure print options (see print).
To print the entire contents of the Signal Builder block, specify [].

Data Types: char | string

'figure' — Figure
'figure'

Create a figure containing contents of Signal Builder block.

Data Types: char | double | string

Output Arguments

time — Time

row vector | column cell vector | row cell vector | cell matrix

Time for the Signal Builder block, returned as row vector, column cell vector, row cell vector, or cell matrix. For the Signal Builder block, time is the x-coordinate.

time returns in different formats depending on the block configuration.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Time Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 signal, 1 group</td>
<td>Row vector of break points.</td>
</tr>
<tr>
<td>&gt;1 signal, 1 group</td>
<td>Column cell vector where each element corresponds to a separate signal and contains a row vector of points.</td>
</tr>
<tr>
<td>1 signal, &gt;1 group</td>
<td>Row cell vector where each element corresponds to a separate group and contains a row vector of points.</td>

</tr>
</tbody>
</table>

data — Data

row vector | column cell vector | row cell vector | cell matrix

Data of the Signal Builder block, returned as a one-dimensional array. For the Signal Builder block, time is the y-coordinate.

data takes different formats depending on the block configuration.
### Configuration | Data Format
---|---
1 signal, 1 group | Row vector of break points.
>1 signal, 1 group | Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group | Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group | Cell matrix where each element (i, j) corresponds to signal i and group j.

Datasets must have the same number of elements as the signals in a signal group. Dataset format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
  - Timeseries data and/or time cannot be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

#### signames — Signal names
character vector | cell array of character vectors

Signal names, returned as a character vector or cell array of character vectors.

#### block — Signal Builder block path or handle
block handle

Signal Builder block path or handle, returned by block creation or append commands.

#### ds — Dataset
timeseries data elements | 1-D scalar data value at each time | nonempty data and/or time

Dataset of timeseries elements, returned as a `Simulink.SimulationData.Dataset` object.

#### ds, ...dsN — Multiple datasets
vectors of timeseries data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time
One or more datasets of timeseries elements, returned as Simulink.SimulationData.Dataset objects.

**index — Group index**
active group index

Active signal group index.

**activeGroupLabel — Active group label**
index

Active group label, returned as an index.

**figh — Figure handle**
handle

Figure handle, returned when contents of Signal Builder block are printed to the hidden figure.

## More About

### Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the signalbuilder function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the signalbuilder function supplies data. When specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```matlab
t = 0.2*[0:49]';
```

## Topics

“Load Data with Interchangeable Scenarios”
“Signal Groups”
Introduced in R2007a
signalEditor

Start Signal Editor

Syntax

signalEditor
signalEditor(Name,Value)

Description

signalEditor starts Signal Editor without an associated model.

signalEditor(Name,Value) starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes ('). You can specify the name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

• Model - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the signalEditor function.

Note Load the model before starting Signal Editor for it.

• DataSource - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the signalEditor function.

Note You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

Examples
**Start Signal Editor for a Model**

Start the Signal Editor for the model, slexAutotransRootInportsExample.

Load the slexAutotransRootInportsExample model, then start Signal Editor for it.

```matlab
open_system('slexAutotransRootInportsExample')
signalEditor('Model', 'slexAutotransRootInportsExample');
```

**Start Signal Editor to Edit a Data Set File**

Start Signal Editor to edit myFile.mat.

```matlab
signalEditor('DataSource','myFile.mat');
```

**Start Signal Editor and Data Set File for a Model**

Load the slexAutotransRootInportsExample model, then start Signal Editor for the model, and edit myFile.mat.

```matlab
open_system('slexAutotransRootInportsExample')
signalEditor('Model','slexAutotransRootInportsExample','DataSource','myFile.mat');
```

**See Also**

**Topics**

“Create and Edit Signal Data”

**Introduced in R2017b**
sim

Simulate dynamic system

Syntax

simOut = sim(model)
simOut = sim(model,Name,Value)
simOut = sim(model,ParameterStruct)
simOut = sim(model,ConfigSet)
simOut = sim(model,'ReturnWorkspaceOutputs','on')
simOut = sim(simIn)

Description

simOut = sim(model) simulates the specified model using existing model configuration parameters, and returns the result as either a Simulink.SimulationOutput object (single-output format) or as a time vector compatible with Simulink version R2009a or earlier. See “Backward-Compatible Syntax” on page 2-526.

To return simulation results using the single-output format (simulation object), Single simulation output on the Data Import/Export pane of the Configuration Parameters dialog box is selected by default This selection overrides the Dataset format used for signal logging.

To return simulation results using the backward-compatible format (time vector),

simOut = sim(model,Name,Value) simulates the specified model using parameter name-value pairs.

simOut = sim(model,ParameterStruct) simulates the specified model using the parameter values specified in the structure ParameterStruct.

simOut = sim(model,ConfigSet) simulates the specified model using the configuration settings specified in the model configuration set ConfigSet.
simOut = sim(model,'ReturnWorkspaceOutputs','on') simulates the specified model using existing model configuration parameters, and returns the result as a Simulink.SimulationOutput object (single-output format).

simOut = sim(simIn) simulates a model using the inputs specified in the SimulationInput object, simIn. The sim command is also used with an array of SimulationInput objects to run multiple simulations in a series. If simIn is an array of Simulink.SimulationInput objects, output is returned as an array of Simulink.SimulationOutput objects.

Examples

Simulate Model with Default Parameter Settings

Simulate the model vdp using default model configuration parameters.

simOut = sim('vdp','ReturnWorkspaceOutputs','on')

Simulate Model with sim Command-Line Options

Simulate the model, vdp, in Accelerator mode for an absolute tolerance of 1e-5 and save the states in xoutNew and the output in youtNew.

Specify parameters as name-value pairs to the sim command:

simOut = sim('vdp','SimulationMode','accel','AbsTol','1e-5',...  'SaveState','on','StateSaveName','xoutNew',...  'SaveOutput','on','OutputSaveName','youtNew')

simOut =
  Simulink.SimulationOutput:
     xoutNew: [65x2 double]
     youtNew: [65x2 double]
  SimulationMetadata: [1x1 Simulink.SimulationMetadata]
  ErrorMessage: [0x0 char]
Simulate Model with `sim` Command-Line Options in Structure

Simulate the model, `vdp`, in Accelerator mode for an absolute tolerance of `1e-5` and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters using a name-value pairs structure `paramNameValStruct` for the `sim` command:

```matlab
paramNameValStruct.SimulationMode = 'accel';
paramNameValStruct.AbsTol = '1e-5';
paramNameValStruct.SaveState = 'on';
paramNameValStruct.StateSaveName = 'xoutNew';
paramNameValStruct.SaveOutput = 'on';
paramNameValStruct.OutputSaveName = 'youtNew';
simOut = sim('vdp',paramNameValStruct)
```

`simOut` =
```
Simulink.SimulationOutput:
    xoutNew: [65x2 double]
    youtNew: [65x2 double]
    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Configuration Set

Simulate the model, `vdp`, in Accelerator mode for an absolute tolerance of `1e-5` and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs in configuration set `mdl_cs` for the `sim` command:

```matlab
mdl = 'vdp';
load_system(mdl)
simMode = get_param(mdl, 'SimulationMode');
set_param(mdl, 'SimulationMode', 'accel')
cs = getActiveConfigSet(mdl);
mdl_cs = cs.copy;
set_param(mdl_cs,'AbsTol','1e-5',...    'SaveState','on','StateSaveName','xoutNew',...
simOut = sim(mdl, mdl_cs)
set_param(mdl, 'SimulationMode', simMode)

simOut = Simulink.SimulationOutput:
    xoutNew: [65x2 double]
    youtNew: [65x2 double]
    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]

For more information, see Simulink.ConfigSetRef.

**Input Arguments**

*model* — Model to simulate
character vector

Name of model to simulate, specified as a character vector.

Example: `simOut = sim('vdp')`

*ParameterStruct* — Structure containing parameter settings
structure

Structure with fields that are the names of the configuration parameters for the simulation. The corresponding values are the parameter values.

Example: `simOut = sim('vdp', paramNameValStruct)`

*ConfigSet* — Configuration set
object

The set of configuration parameters for a model.

Example: `simOut = sim('vdp', mdl_cs)`

*simIn* — SimulationInput object for a model
object
SimulationInput object created by specifying the model name. For more information, see Simulink.SimulationInput.

Example: simIn = Simulink.SimulationInput('vdp')

Use the SimulationInput object to specify Block Parameters, Model Parameters, Variables and External Inputs to a model to be simulated.

Example: simIn = simIn.setBlockParameter('CSTR/Feed Temperature', 'Value', '300'); simIn = simIn.setModelParameter('StartTime', '1'); simIn = simIn.setVariable('FeedTemp0', 320)

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: 'Solver','ode15s', 'TimeOut', '30' specifies that the model is simulated using the ode15s solver with a maximum simulation time of 30 seconds.

The `sim` command accepts all simulation parameters as name-value pair arguments. See “Model Parameters” on page 6-2 for a list of all simulation parameters.

In addition, the `sim` command accepts the following parameters that are not available on the Configset and `set_param`

**CaptureErrors — Save errors to SimulationMetadata object**

off (default) | on

By default, if an error occurs during simulation, the `sim` command stops and reports the error in the MATLAB Command Window. If you specify 'CaptureErrors', 'on', the `sim` command does not stop, but instead saves any errors to the ErrorDiagnostic structure within the SimulationMetadata object. The error message is saved in the ErrorMessage property of the SimulationOutput object.

This option is useful when running multiple simulations in a loop, so that one simulation error will not stop a script or function from continuing.

If you specify an array of input objects, the `sim` commands runs with CaptureErrors enabled. If an error occurs, the error messages are included in the
Simulink.SimulationMetadata object for the simulation, as well as simulation data up to the point of the failure.

This option is not available for simulation in SIL and PIL modes.

Example: 'CaptureErrors','on'

ConcurrentResolvingToFileSuffix — Append suffix to model name
character vector

(Rapid Accelerator mode only) Appends this suffix character vector to the filename of a model (before the file extension) if:

- The model contains a To File block.
- You call the sim command from parfor.

Example: 'ConcurrentResolvingToFileSuffix','model'

Debug — Run simulation in debug mode
off (default) | on | cmds | cell array

Setting the value of 'Debug' argument to 'on' starts the simulation in debug mode (see “Debugger Graphical User Interface” for more information). The value of this option can be a cell array of commands to be sent to the debugger after it starts.

Example: 'Debug','on'

LoggingFileName — Specify name of MAT-file to log data
out.mat (default) | character vector

Use when you enable the LoggingToFile name-value pair for logging to persistent storage. Specify the destination MAT-file for data logging.

Tip Do not use a file name from one locale in a different locale.

Example: 'LoggingFileName','out.mat'

LoggingToFile — Log simulation data to MAT-file
off (default) | on

Store logged data that uses Dataset format to persistent storage (MAT-file).
Use this feature when logging large amounts of data that can cause memory issues. For details, see “Log Data to Persistent Storage”.

**Tip** To avoid running out of memory when accessing stored data, you can use a reference to access the object stored in the MAT-file. Use a `Simulink.SimulationData.DatasetRef` object to access stored data by reference. Using this object loads signal logging and states data into the model workspace incrementally (signal by signal). Accessing data for other kinds of logging loads all of the data at once.

Example: 'LoggingToFile','on'

**RapidAcceleratorParameterSets** — Pass run-time parameters directly to Rapid Accelerator simulations

structure

(Rapid Accelerator mode only) Returns structure that contains run-time parameters for running Rapid Accelerator simulations in `parfor`.

Example: 'RapidAcceleratorParameterSets',parameterSet(idx)

**RapidAcceleratorUpToDateCheck** — Perform up-to-date check before simulation

on (default) | off

(Rapid Accelerator mode only) Enables/disables up-to-date check. If you set this value to 'off', Simulink does not perform an up-to-date check. It skips the start/stop callbacks in blocks. If you call the `sim` command from `parfor`, set this value to 'off'.

When you set this option to 'off', changes that you make to block parameter values in the model (for example, by using block dialog boxes, by using the `set_param` function, or by changing the values of MATLAB variables) do not affect the simulation. Instead, use `RapidAcceleratorParameterSets` to pass new parameter values directly to the simulation.

Example: 'RapidAcceleratorUpToDateCheck','off'

**SrcWorkspace** — Workspace in which to evaluate MATLAB expressions

base (default) | current | parent

Specifies the workspace in which to evaluate MATLAB expressions defined in the model. Setting `SrcWorkspace` has no effect on a referenced model that executes in Accelerator
mode. Setting SrcWorkspace to current within a parfor loop causes a transparency violation.

Example: 'SrcWorkspace','current'

**TimeOut — Maximum simulation run time**
positive scalar

Specify the time, in seconds, to allow the simulation to run. If you run your model for a period longer than the value of TimeOut, the software issues a warning and stops the simulation. TimeOut refers to the time spent for a simulation.

Example: 'TimeOut',60

**Trace — Enables simulation tracing facilities**
minstep|siminfo|compile

Enables simulation tracing facilities (specify one or more as a comma-separated list):

- 'minstep' specifies that simulation stops when the solution changes so abruptly that the variable-step solvers cannot take a step and satisfy the error tolerances.
- 'siminfo' provides a short summary of the simulation parameters in effect at the start of simulation.

By default, Simulink issues a warning message and continues the simulation.

Example: 'Trace','minstep','Trace','siminfo','Trace','compile'

**Output Arguments**

**simOut — Simulation object containing logged simulation results**
object

Simulink.SimulationOutput object that contains all of the logged simulation results.

All simulation outputs (logged time, states, and signals) are returned in a single Simulink.SimulationOutput object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers and Generators Manager** can directly log signals.
Note  The output of the sim command always returns to SimOut, the single simulation output object. The simulation output object in turn, is returned to the workspace.

More About

Backward-Compatible Syntax

Starting with R2009b, the sim command was enhanced to provide greater compatibility with parallel computing. The improved single-output format saves all simulation results to a single object, simplifying the management of output variables.

For backward compatibility with R2009a or earlier releases, use the backward-compatible syntax:

\[ [T, X, Y] = \text{sim}('model', \text{Timespan}, \text{Options}, \text{UT}) \]
\[ [T, X, Y_1, \ldots, Y_n] = \text{sim}('model', \text{Timespan}, \text{Options}, \text{UT}) \]

If you specify only the model argument, Simulink automatically saves the time, state, and output to the specified output arguments.

If you do not specify any output arguments, Simulink determines what data to log based on the settings for the Configuration Parameters > Data Import/Export pane. Simulink stores the simulation output either in the current workspace or in the variable ans, based on the setting for Save simulation output as a single object parameter.

Backward-Compatible Syntax Input and Output Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( T )</td>
<td>The time vector returned.</td>
</tr>
<tr>
<td>( X )</td>
<td>The state returned in matrix or structure format. The state matrix contains continuous states followed by discrete states.</td>
</tr>
<tr>
<td>( Y )</td>
<td>The output returned in matrix or structure format. For block diagram models, this variable contains all root-level blocks.</td>
</tr>
<tr>
<td>( Y_1, \ldots, Y_n )</td>
<td>The outports, which can only be specified for diagram models. Here, ( n ) must be the number of root-level blocks. Each outport will be returned in the ( Y_1, \ldots, Y_n ) variables.</td>
</tr>
<tr>
<td>'model'</td>
<td>The name of the model to simulate.</td>
</tr>
</tbody>
</table>
Simulink requires only the `model` argument. Simulink takes all defaults from the block diagram, including unspecified options. If you specify any optional arguments, your specified settings override the settings in the block diagram.

Specifying an input argument of `sim` as the empty matrix, `[]`, causes Simulink to use the default for that argument.

**Backward-Compatible Syntax Examples**

This command simulates the Van der Pol equations, using the `vdp` model. The command uses all default parameters.

```
[t,x,y] = sim('vdp')
```

This command simulates the Van der Pol equations, using the parameter values associated with the `vdp` model.

```
[t,x,y] = sim('vdp', [0 10]);
```

**Tips**

- Parameters specified using the `sim` command override the values defined in the *Model Configuration Parameters* dialog box. The software restores the original configuration values at the end of simulation.

- In the case of a model with a model reference block, the parameter specifications are applied to the top model.

- When simulating a model with infinite stop time, to stop the simulation, you must press `Ctrl+C`. `Ctrl+C` breaks the simulation and the simulation results are not saved in the MATLAB workspace.
To specify the time span for a simulation, you must specify the **StartTime** and **StopTime** parameters.

To log the model time, states, or outputs, use the **Data Import/Export** pane of the Model Configuration Parameters dialog box.

To log signals, either use a block such as the To Workspace block or the Scope block, or use the Viewers and Generators Manager to log results directly.

To get a list of simulation parameters for the model `vdp`, in the MATLAB Command Window, enter:

```matlab
cfgSet = getActiveConfigSet('vdp')
cfgSetNames = get_param(cfgSet, 'ObjectParameters')
```

This command lists several object parameters, including simulation parameters such as 'StartTime', 'SaveTime', 'SaveState', 'SaveOutput', and 'SignalLogging'.

**Introduced before R2006a**
simplot

Redirects to the Simulation Data Inspector

**Note** simplot will be removed in a future release. Use the Simulation Data Inspector instead.

**Syntax**

simplot

**Description**

simplot redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function Simulink.sdi.view instead.

**See Also**

Simulink.sdi.view
Simulation Manager

Monitor multiple simulations and visualize the simulation data

Description

Simulation Manager allows you to monitor the status of multiple simulations. Using this tool, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out and view diagnostics for each simulation.
- Visualize simulation data to analyze the trends across the simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation settings applied to the model.
- View simulation results in the Simulation Data Inspector.
- Abort simulations.

Open the Simulation Manager

- parsim and sim commands — Set the argument ShowSimulationManager to on with Parallel Computing Toolbox. The parsim and sim commands use a Simulink.SimulationInput object to run simulations. For more information, see Simulink.SimulationInput.

\[
\text{out} = \text{parsim}(\text{in}, '\text{ShowSimulationManager}', 'on')
\]

\[
\text{out} = \text{sim}(\text{in}, '\text{ShowSimulationManager}', 'on')
\]

- To open a saved Simulation Manager session, navigate to the folder where the file is saved and double click the .mldatx Simulation Manager file.

\[
\text{open} \ \text{filename.mldatx}
\]
Examples

Open Simulation Manager

Open the model sldemo_suspn_3dof and create a set of sweep values.

mdl = 'sldemo_suspn_3dof';
open_system(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);

To modify the block parameter Road-Suspension Interaction with the sweep values, create an array of Simulink.SimulationInput objects.

in(1:numSims) = Simulink.SimulationInput(mdl);
for i = 1:numSims
  in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end

Run multiple simulations and open the Simulation Manager.

out = parsim(in, 'ShowSimulationManager', 'on')

In the absence of Parallel Computing Toolbox, the simulations run in serial.
Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

![Simulation Manager UI](image)

**Plot results**

In the **Figure 1** tab, you can view the default scatter plot where the parameter \( C_f \) is plotted against itself. Use the **Plot Properties** to edit the plot. Add grid lines for \( X \) and \( Y \) by checking the corresponding boxes. You can also change the data that is displayed on X-
and Y-axes and the Marker Color. Change the data on y-axis by selecting ScopeData(1) from the Data drop-down. Set the Marker Color Data field to RunID.

To add another figure to the Simulation Manager, click surf or scatter plot and add plots as desired. In this example, click surf plot, located in the Results section of the toolstrip. Drag the Figure 2 tab to view the two plots together.

Plots in the Simulation Manager support numeric arrays and datasets.
Adding multiple plots to the Simulation Manager enables you to observe the simulation data in different ways. Using the results, you can analyze and study the design space of the parameters and their behavior.

You can modify the configuration of the plot layouts by clicking the down arrow on the left corner of the plot.

- **Tile All** — Choose a layout for multiple plots.
- **Tab Position** — Select where to display the figure tab.

**View the Status**

To view the status of the simulations in list and grid views, click the **Simulations** tab next to **Figure 1**. Toggle between the **List** and **Grid** in the **Views** section of the toolstrip. The list view shows a tabular view of the simulations with certain details, such as status, parameters and timing information. For large number of simulations, choose grid view for a compact view of the status of the simulations.
The status bar at the bottom of the window shows the progress of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns. Use the button to choose which columns to display. You can also sort the columns based on your preference.

Click a specific run to view more details about it. The simulation details appear at the bottom of the window.
To show or hide the details of the selected simulation, toggle the **Simulation Details** button.

**Open Selected** button, allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the **Show Results** button. Clicking Show Results creates a Simulation Data Inspector run from the `Simulink.SimulationOutput` object and is displayed in Simulation Data Inspector.

To abort the job while the simulations are running, you can use the **Stop Job** button.

**Save the Session**

To save the Simulation Manager session, click the **Save** button on the toolstrip. The saved session contains all the simulation data and the plot configurations and layout. To reopen the saved Simulation Manager session, navigate to the folder where the file is saved and double-click the `.mldatx` Simulation Manager file.

The **Reuse Window** button enables you to reuse the plot layout and configurations for new multiple simulations run with a different set of data. If the button is toggled off, a new window opens with each set of simulations. If the button is toggled on, the new simulations reuse the existing window preserving all plot configurations and layouts.

To reopen a saved file, use the **Open** button, navigate to the file location and double click the file.

simulink

Open Simulink Start Page

Syntax

simulink

Description

simulink opens the Simulink Start Page. From the Start Page, choose a model or project template, or browse the examples. See “Create and Open Models”.

The behavior of the simulink function changed in R2016a. Formerly it opened the Simulink Library Browser and loaded the Simulink block library.

- To open the Library Browser, use slLibraryBrowser.
- To only load the Simulink block library, use this command:
  
  load_system simulink

- To start Simulink without opening the Library Browser or Start Page, use start_simulink, which is faster.

“Create and Open Models”
“Modeling”

Introduced before R2006a
simulinkproject

(Not recommended) Open project and get project object

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

**Syntax**

```matlab
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

**Description**

`simulinkproject` opens the project or brings focus to the tool if it is already open. After you open the tool, you can create projects or access recent projects using the **Project** tab.

`simulinkproject(projectPath)` opens the project specified by any file or folder under the project root in `projectPath` and gives focus to the project.

`proj = simulinkproject` returns a project object `proj` you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

`proj = simulinkproject(projectPath)` opens the project specified by `projectPath` and returns a project object.

**Examples**
**Open Project Tool**

Open the Project Tool.

`simulinkproject`

**Open a Project**

Specify either the `.prj` file path or the folder that contains your `.SimulinkProject` folder and `.prj` file. The project opens and brings focus to the project.

`simulinkproject('C:/projects/project1/')`

**Open a Project and Get a Project Object**

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`. If you use `uiopen(myproject.prj)` this calls `simulinkproject` with no output argument and gives focus to the project.

`start_simulink`

`proj = simulinkproject('C:/projects/project1/myproject.prj')`

**Get Airframe Example Project**

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

`sldemo_slproject_airframe`

`proj = simulinkproject`

`proj =`

`ProjectManager with properties:`

```
Name: 'Simulink Project Airframe Example'
Information: [1x1 slproject.Information]
```
Find Project Commands

Find out what you can do with your project.

\texttt{methods(proj)}

**Examine Project Properties Programmatically**

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```matlab
files = proj.Files
```

```matlab
files =

1x31 ProjectFile array with properties:

Path
Labels
Revision
SourceControlStatus

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```matlab
proj.Files(15)
```

```matlab
ans =

ProjectFile with properties:

Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'
Labels: [1x1 slproject.Label]
Revision: '2'
SourceControlStatus: Unmodified

Examine the labels of the file.

```matlab
proj.Files(15).Labels
```

```matlab
ans =

Label with properties:
Get a particular file by name.

```matlab
code = findFile(proj, 'models/AnalogControl.slx')
code =
    ProjectFile with properties:
    Path: 'C:slexamples\airframe24\models\AnalogControl.slx'
        Labels: [1x1 slproject.Label]
        Revision: '2'
        SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```matlab
methods(code)
```

Methods for class slproject.ProjectFile:

- addLabel
- findLabel
- removeLabel

Update the file dependencies.

```matlab
update(proj.Dependencies)
```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see “Automate Simulink Project Tasks Using Scripts”.

Input Arguments

- **projectPath** — Full path to project file or folder
  character vector

  Full path to project .prj file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.
Example: 'C:/projects/project1/myProject.prj'
Example: 'C:/projects/project1/'

**Output Arguments**

**proj — Project**

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of **proj** output argument.

<table>

<td>An array of the startup files in this project</td>
</tr>
</tbody>
</table>
**Tips**

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getProjects` and `slproject.loadProject` for project automation scripts.

**Compatibility Considerations**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features might be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

Simulink.allBlockDiagrams

Find loaded Simulink models and libraries

Syntax

bd = Simulink.allBlockDiagrams()
bd = Simulink.allBlockDiagrams(type)

Description

bd = Simulink.allBlockDiagrams() returns all loaded block diagrams, including models and libraries.

bd = Simulink.allBlockDiagrams(type) returns either models or libraries.

Examples

Find Loaded Models

Find all loaded models in the current Simulink session, excluding libraries. The example shows a result from a typical session.

Simulink.allBlockDiagrams('model')

ans =

237.0001
56.0001
2.0001
Get Names of Loaded Block Diagrams

Find all loaded models in the current Simulink session and return results as names. Use Simulink.allBlockDiagrams with get_param to get the names. The example shows a result from a typical session and includes loaded libraries and models.

```
get_param(Simulink.allBlockDiagrams(),'Name')
```

```
ans =

5×1 cell array

    {'simulink_extras' }
    {'simulink'      }     }
    {'sldemo_fuelsys' }
    {'f14'            }     }
    {'vdp'            }
```

Get Loaded Block Diagrams Based on Parameter

Find all loaded models in the current Simulink session whose 'Dirty' parameter is 'on'.

```
bds = Simulink.allBlockDiagrams();
dirtyBds = bds(strcmp(get_param(bds,'Dirty'),'on'));
```

Input Arguments

- **type** — Type of block diagram whose blocks to return
  
  *'model'* | *'library'*

  Type of block diagram whose blocks to return, specified as *'model'* or *'library'*.

Output Arguments

- **bd** — Loaded block diagrams
  
  array of handles

  Loaded block diagrams, returned as an array of handles.

Introduced in R2018a
Simulink.architecture.add

Add tasks or triggers to selected architecture of model

Syntax

Simulink.architecture.add(Type,Object)

Description

Simulink.architecture.add(Type,Object) adds the new task or trigger Object of the specified Type to a model.

Examples

Add periodic trigger

Add a task, MyTask1, to the software node MulticoreProcessor of the selected architecture of the slexMulticoreExample model.

slexMulticoreExample;
Simulink.architecture.add('Task','slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');

Input Arguments

Type — Object type

'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, specified as a 'PeriodicTrigger', 'AperiodicTrigger', or 'Task'.

• 'PeriodicTrigger'

    Adds a periodic trigger to the architecture. Set the properties of the trigger with the Simulink.architecture.set_param function.
• 'AperiodicTrigger'

  Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the Simulink.architecture.set_param function.

• 'Task'

  Adds a task to the architecture. Set the properties of the task with the Simulink.architecture.set_param function.

**Object — Trigger or task object identifier**

character vector

Trigger or task object identifier to add to architecture, specified as a character vector. Example: 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'

Data Types: char

**See Also**

**Introduced in R2014a**
Simulink.architecture.config

Create or convert configuration for concurrent execution

Syntax

Simulink.architecture.config(model,'Convert')
Simulink.architecture.config(model,'Add')
Simulink.architecture.config(model,'OpenDialog')

Description

Simulink.architecture.config(model,'Convert') converts the active configuration set in the specified model to one for concurrent execution.

Simulink.architecture.config(model,'Add') adds and activates a new configuration set for concurrent execution.

Simulink.architecture.config(model,'OpenDialog') opens the Concurrent Execution dialog box for a model configuration.

Examples

Convert existing configuration set

Convert existing configuration set for concurrent execution in the model vdp.

vdp;
Simulink.architecture.config('vdp','Convert');

Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model vdp.
vdp; 
Simulink.architecture.config('vdp','Add');

**Open Concurrent Execution dialog box**

Open the Concurrent Execution dialog box in the model slexMulticoreExample.

slexMulticoreExample; 
Simulink.architecture.config('slexMulticoreExample','OpenDialog');

**Input Arguments**

`model` — Model name
character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: char

**See Also**

Simulink.architecture.add | Simulink.architecture.profile | Simulink.architecture.set_param

Introduced in R2014a
signalBuilderToSignalEditor

Import signal data and properties from Signal Builder block to Signal Editor block

Syntax

signal_editor = signalBuilderToSignalEditor(signal_builder, Name, Value)
[signal_editor, sorted_group_index, sorted_group_names] = signalBuilderToSignalEditor(signal_builder, Name, Value)

Description

signal_editor = signalBuilderToSignalEditor(signal_builder, Name, Value) imports signal data and properties from Signal Builder block to the Signal Editor block. This function adds a Signal Editor block to the current model using the signal data and properties from the Signal Builder block.

During the port, the signalBuilderToSignalEditor function:

- Unicode group names are prefixed with Test_Case_.
- Group names are converted to valid MATLAB variable names with leading and trailing white spaces removed.
- Group names are converted with trailing underscores removed.
- Remaining numbers maintained in the scenario name.
- Orders signal groups alphabetically.
- Creates unique group names from existing names following MATLAB conventions.

The signalBuilderToSignalEditor function does not support

- Models that contain test case parameters. You can successfully port data from the Signal Builder block, but you cannot initialize parameters with the Signal Editor block in test harnesses generated by Simulink Design Verifier.
- Models that contain Signal Builder signal generators created from the **Create and Connect Generator** context menu.
[signal_editor,sorted_group_index,sorted_group_names] = signalBuilderToSignalEditor(signal_builder,Name,Value) outputs vectors containing the signal groups and group names.

**Examples**

**Replace Signal Builder Block with Signal Editor Block**

This example shows how to replace an existing Signal Builder block with a Signal Editor block. To store signals from Signal Builder, the example uses RoadProfiles.mat.

```matlab
model = 'ex_replace_signalbuilder';
open_system(model);
sbBlockH = [model '/Road Profiles'];
seBlockH = signalBuilderToSignalEditor(sbBlockH,...
'Replace',true,'FileName','RoadProfiles.mat');
```

**Input Arguments**

`signal_builder` — Signal Builder block to replace

- current model (default) | scalar

Signal Builder block to replace, specified as a scalar.

Data Types: char | string
**Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1,...,NameN, ValueN.

Example: 'FileName','RoadProfiles.mat'

**FileName — MAT-file that stores signals**

'dataset.mat' (default) | scalar

MAT-file that stores signals and properties, specified as a scalar. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Data Types: char | string

**Replace — Replace Signal Builder block with Signal Editor block**

false (default) | true

Replace Signal Builder block with Signal Editor block, specified as true or false.

Data Types: logical

**Output Arguments**

**signal_editor — Signal Editor block handle**

scalar

Signal Editor block handle, specified as a scalar.

**sorted_group_index — List of Signal Builder group indices**

vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

**sorted_group_names — List of Signal Builder group names**

cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.
The names are unique valid MATLAB variable names generated from the Signal Builder group names.

Signal Editor | Signal Builder | signalEditor | signalbuilder

Introduced in R2018a
**Simulink.architecture.delete**

Delete triggers and tasks from selected architecture of model

**Syntax**

```matlab
Simulink.architecture.delete(Object)
```

**Description**

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

**Examples**

**Delete task Plant**

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the slexMulticoreExample model.

```matlab
slexMulticoreExample
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

**Input Arguments**

- **Object** — Object to delete, specified as a character vector
  - character vector

  Object to be deleted. Possible objects are:
  
  - Periodic trigger
**Note** You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: `char`

**See Also**

`Simulink.architecture.add` | `Simulink.architecture.find_system` | `Simulink.architecture.get_param` | `Simulink.architecture.importAndSelect` | `Simulink.architecture.profile` | `Simulink.architecture.register`

**Introduced in R2014a**
Simulink.architecture.find_system

Find objects under architecture object

Syntax

object = Simulink.architecture.find_system(RootObject)

object = Simulink.architecture.find_system(RootObject,ParamName, ParamValue)

Description

object = Simulink.architecture.find_system(RootObject) looks for all objects under RootObject.

object = Simulink.architecture.find_system(RootObject,ParamName, ParamValue) returns the object in RootObject whose parameter ParamName has the value ParamValue. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in slexMulticoreExample:

slexMulticoreExample

 \texttt{t = Simulink.architecture.find_system('slexMulticoreExample')} 

\texttt{t =

 'slexMulticoreExample'
 'slexMulticoreExample/MulticoreProcessor'
 'slexMulticoreExample/MulticoreProcessor/Core1'
 'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
 'slexMulticoreExample/MulticoreProcessor/Core1/Task2'}
Look for all tasks

To find all the tasks in slexMulticoreExample:

```matlab
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample','Type','Task')
t =

'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

**RootObject — Object to search**
character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example:`'slexMulticoreExample'`

**ParamName — Name of parameter to find**
character vector | scalar | vector

Name of the parameter to find. Possible values are:
• 'Name'
• 'Type'
• 'ClockFrequency'
• 'Color'
• 'Period'
• 'EventHandlerType'
• 'SignalNumber'
• 'EventName'

Example: 'EventName'

**ParamValue — Parameter value to find**

class name | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: 'ERTDefaultEvent'

**See Also**

Simulink.architecture.add | Simulink.architecture.delete |
Simulink.architecture.importAndSelect | Simulink.architecture.profile |
Simulink.architecture.register | Simulink.architecture.set_param

**Introduced in R2014a**
Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

ParamValue = Simulink.architecture.get_param(Object,ParamName)

Description

ParamValue = Simulink.architecture.get_param(Object,ParamName) returns
the value of the specified parameter for the object, Object. ParamName is case-sensitive.

Examples

Get period

Get the period of task Task3 of trigger Core2 of software node MulticoreProcessor of the
selected architecture for the model slexMulticoreExample.

slexMulticoreExample;
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')

p =
0.2

Input Arguments

Object — Object whose parameter value to return
character vector

Object whose parameter value to return, specified as a character vector giving the object
full path name. Possible objects are:
• Software node
• Hardware node
• Periodic trigger
• Aperiodic trigger
• Task

**ParamName** — **Parameter whose value to return**

character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:
- 'ArchitectureName'
- 'Type'

For a software node:
- 'Name'
- 'Type'

For a hardware node
- 'Name'
- 'ClockFrequency'
- 'Color'
- 'Type'

For a periodic trigger:
- 'Name'
- 'Period'
- 'Color'
- 'Type'

For an aperiodic trigger:
• 'Name'
• 'Color'
• 'EventHandlerType'
• 'SignalNumber'
• 'EventName'
• 'Type'

For a task:

• 'Name'
• 'Period'
• 'Color'
• 'Type'

Introduced in R2014a
Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

Simulink.architecture.importAndSelect(model, Architecture)

Simulink.architecture.importAndSelect(model, CustomArchitectureDescriptionFile)

Description

Simulink.architecture.importAndSelect(model, Architecture) imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Simulink.architecture.importAndSelect(model, CustomArchitectureDescriptionFile) imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model slexMulticoreExample.
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')

**Import and select a custom architecture**

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')

**Input Arguments**

**model** — Model
character vector

Model to import architecture to, specified as a character vector.

Data Types: char

**Architecture** — Target architecture name
character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'Multicore'</td>
<td>Single CPU with multiple cores</td>
</tr>
<tr>
<td>'Sample Architecture'</td>
<td>Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.</td>
</tr>
<tr>
<td>'Simulink Real-Time'</td>
<td>Simulink Real-Time™ target</td>
</tr>
<tr>
<td>'Xilinx Zynq ZC702 evaluation kit'</td>
<td>Xilinx® Zynq® ZC702 evaluation kit target</td>
</tr>
<tr>
<td>'Xilinx Zynq ZC706 evaluation kit'</td>
<td>Xilinx Zynq ZC706 evaluation kit target</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>'Xilinx Zynq Zedboard'</td>
<td>Xilinx Zynq ZedBoard™ target</td>
</tr>
</tbody>
</table>

Data Types: char

**CustomArchitectureDescriptionFile — Custom target architecture file**

XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: custom_arch.xml

**See Also**

**Topics**

“Define a Custom Architecture File”

**Introduced in R2014a**
Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

Simulink.architecture.profile(model)
Simulink.architecture.profile(model,numSamples)

Description

Simulink.architecture.profile(model) generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

Simulink.architecture.profile(model,numSamples) specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model slexMulticoreExample.

slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample');

The command creates the file slexMulticoreExample_ProfileReport.html in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model slexMulticoreExample with data for 120 time steps.
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample',120);

The command creates the file slexMulticoreExample_ProfileReport.html in the current folder.

**Input Arguments**

**model — Model to profile**
character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: char

**numSamples — Number of time steps**
100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

**Introduced in R2014a**
Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

Simulink.architecture.register(CustomArchFile)

Description

Simulink.architecture.register(CustomArchFile) adds an XML-format custom target architecture file CustomArchFile to the concurrent execution target architecture selector. To access this selector, click the Select button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file custom_arch.xml to the concurrent execution target architecture selector. This example requires you to create a custom_arch.xml first.

slexMulticoreExample
Simulink.architecture.register('custom_arch.xml')

Input Arguments

CustomArchFile — Custom target architecture file
XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.
See Also
Simulink.architecture.add | Simulink.architecture.delete |
Simulink.architecture.find_system |
Simulink.architecture.importAndSelect | Simulink.architecture.profile |
Simulink.architecture.set_param

Introduced in R2014a
Simulink.architecture.set_param

Set architecture object properties

Syntax

Simulink.architecture.set_param(Object,ParamName,ParamValue)

Description

Simulink.architecture.set_param(Object,ParamName,ParamValue) sets the specified parameter of Object to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from MulticoreProcessor to MyCPUNewName.

slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'], 'Name', 'MyCPUNewName');

Change Periodic

Set Core2 trigger period to .01.

slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'], 'Period', '.01')

Input Arguments

Object — Object whose parameter value to set
character vector
Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

**ParamName** — **Name of the parameter to set**

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- 'Name' — Name of the software node.

For hardware node:

- 'Name' — Name of the hardware node.
- 'ClockFrequency' — Frequency of the hardware node clock.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- 'Name' — Name of the trigger.
- 'Period' — Period of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- 'Name' — Name of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).
- 'EventHandlerType' — Trigger source for the interrupt-driven task. Possible values:
• 'Event (Windows)'
• 'Posix Signal (Linux/VxWorks 6.x)'
• 'SignalNumber' — Signal number for the trigger. You can set this value only if EventHandlerType is set to Event (Windows).
• 'EventName' — Event name for the trigger. You can set this value only if EventHandlerType is set to Posix Signal (Linux/VxWorks 6.x).

For task:
• 'Name' — Name of the task.
• 'Period' — Period of the task.
• 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: char

ParamValue — Value to set the parameter to
calendar vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: 'MyCPUNewName'

Simulink.architecture.register

Introduced in R2014a
Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

\[ ts = \text{Simulink.Block.getSampleTimes}(\text{block}) \]

Input Arguments

\textit{block}

Full name or handle of a Simulink block

Output Arguments

\textit{ts}

The command returns \textit{ts} which is a 1\(\times\)n array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here \(n\) is the number of sample times associated with the block. The format of the returns is:

\[
1\times n \quad \text{Simulink.SampleTime} \\
\text{Package: Simulink} \\
\text{value: [1x2 double]} \\
\text{Description: [char string]} \\
\text{ColorRGBValue: [1x3 double]} \\
\text{Annotation: [char string]} \\
\text{OwnerBlock: [char string]} \\
\text{ComponentSampleTimes: [1x2 struct]} \\
\text{Methods}
\]

- \textit{value} — A two-element array of doubles that contains the sample time period and offset
- \textit{Description} — A character vector or string that describes the sample time type
- \textit{ColorRGBValue} — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color
• **Annotation** — A character vector or string that represents the annotation of a specific sample time (e.g., ‘D1’)

• **OwnerBlock** — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.

• **ComponentSampleTimes** — A structure array of elements of the same type as Simulink.BlockDiagram.getSampleTimes if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

**Description**

```
ts = Simulink.Block.getSampleTimes(block) performs an update diagram and then returns the sample times of the block connected to the input argument mdl/signal. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.
```

Using this method allows you to access all information in the Sample Time Legend programmatically.

**See Also**

Simulink.BlockDiagram.getSampleTimes

**Introduced in R2009a**
Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model)
>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs)
>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)
>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,strictOnly)

Description

>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model) searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs) searches a model, and if includeLibs is true, includes in the search library blocks for bus signals used implicitly as vectors.

>[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly) searches a model, and if reportOnly is set to false, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If Simulink.BlockDiagram.addBusToVector adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.
If Simulink.BlockDiagram.addBusToVector changes a library block, the change affects every instance of that block in every model that uses the library.

\[
[\text{destBlocks}, \text{busToVectorBlocks}, \text{ignoredBlocks}] = \text{Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,strictOnly)}
\]

searches a model, and if strictOnly is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

**Examples**

**Identify Bus-To-Vector Conversions**

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

\[
\text{open_system(fullfile(matlabroot,'examples','simulink','ex_bus_to_vector'))}
\]

Identify buses treated as vectors.
[blocks] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector')

### Processing block diagram 'ex_bus_to_vector'
### Number of blocks left that are connected to a bus being used as a vector: 2
### Done processing block diagram 'ex_bus_to_vector'

blocks =
1×2 struct array with fields:
    BlockPath
    InputPort
    LibPath

To understand the relationship between Simulink.BlockDiagram.addBusToVector and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 14-10.

**Add Bus to Vector Blocks**

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```matlab
open_system(fullfile(matlabroot,'examples','simulink','ex_bus_to_vector'))
```

![Block diagram of `ex_bus_to_vector` model](image)

Insert Bus to Vector blocks.

When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector_blocks',true,false);

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.

To understand the relationship between Simulink.BlockDiagram.addBusToVector and the Bus signal treated as vector configuration parameter, see “Manage Bus-to-Vector Conversions” on page 14-10.

**Input Arguments**

**model** — Model name or handle
character vector

Model name or handle, specified as a character vector.

**includeLibs** — Search library blocks
false (default) | true

Search library blocks, specified as false or true.

- **false** — Search only the blocks in the model.
- **true** — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: logical

**reportOnly** — Report results without changing model
true (default) | false

Choice to report results without changing the model, specified as false or true.

- **false** — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- **true** — Report search results, but do not change the model.

Specify as the third argument. Also specify the model and includeLibs arguments.

**Data Types:** logical

**strictOnly** — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

false (default) | true

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as false or true. If **strictOnly** is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the model, includeLibs, and reportOnly arguments.

**Data Types:** logical

**Output Arguments**

**destBlocks** — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:
• **BlockPath** — Character vector specifying the path to the block to which the bus connects.
• **InputPort** — Integer specifying the input port to which the bus connects.
• **LibPath** — If the block is a library block instance, and includeLibs is true, the field value is the path to the source library block. Otherwise, LibPath is empty ([]).

**busToVectorBlocks** — Bus to Vector blocks added by function

**cell array**

Bus to Vector blocks added by the function, specified as a cell array. If reportOnly is set to false, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, busToVectorBlocks is empty ([]).

**ignoredBlocks** — Cases where function cannot insert Bus to Vector block

**array of structures**

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

• **BlockPath** — Character vector specifying the path to the block to which the bus connects.
• **InputPort** — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

**Tips**

• Before you execute this function:
  1. Ensure that the model compiles without error.
  2. Save the model.
• Back up the model and any libraries before calling the function with reportOnly set to false.
• To preview the effects of the change on blocks in all models, call Simulink.BlockDiagram.addBusToVector with includeLibs set to true and reportOnly set to true. Then, examine the information returned in the destBlocks output argument.

Bus to Vector

Introduced in R2007a
Simulink.BlockDiagram.arrangeSystem

Improve layout of model or subsystem

Syntax

Simulink.BlockDiagram.arrangeSystem(sys)

Description

Simulink.BlockDiagram.arrangeSystem(sys) improves model or subsystem layout by realigning, resizing, and moving blocks and straightening signal lines.

Examples

Arrange a Programmatically Populated Model

You can use Simulink.BlockDiagram.arrangeSystem with any open model, and it is particularly useful with models you populate programmatically.

Blocks in the model ex_arrange_system are poorly arranged.

open_system('ex_arrange_system')
Similarly, blocks in its subsystem are poorly arranged.

```matlab
open_system('ex_arrange_system/Subsystem')
```

Programmatically arrange blocks in the top layer of the specified systems.

```matlab
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system')
```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system/Subsystem')

### Input Arguments

**sys** — Model name or subsystem block path

character vector

Model name or subsystem block path, specified as a character vector.

### See Also

**Introduced in R2018a**
**Simulink.BlockDiagram.buildRapidAcceleratorTarget**

Build Rapid Accelerator target for model and return run-time parameter set

**Syntax**

```matlab
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl)
```

**Description**

```matlab
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget(mdl) builds a Rapid Accelerator target for model, mdl, and returns run-time parameter set, rtp.
```

**Input Arguments**

`mdl`

Name or handle of a Simulink model

**Output Arguments**

`rtp`

Run-time parameter set that contains two elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>modelChecksum</td>
<td>1x4 vector that encodes the structure of the model.</td>
</tr>
<tr>
<td>parameters</td>
<td>A structure of the tunable parameters in the model. This structure contains the following fields.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
</tbody>
</table>

Introduced in R2012b
Simulink.BlockDiagram.copyContentsToSubsystem

Copy contents of block diagram to empty subsystem

Syntax

Simulink.BlockDiagram.copyContentsToSubsystem(bdiag, subsys)

Description

Simulink.BlockDiagram.copyContentsToSubsystem(bdiag, subsys) copies the contents of the block diagram bdiag to the subsystem subsys. The block diagram and subsystem must have already been loaded. The subsystem cannot be part of the block diagram.

The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets. You can use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

This function cannot be used if the destination subsystem contains any blocks or signals. Other types of information can exist in the destination subsystem and are not affected by the function. Use Simulink.SubSystem.deleteContents if necessary to empty the subsystem before using Simulink.BlockDiagram.copyContentsToSubsystem.

Input Arguments

bdia
Block diagram name or handle

subsys
Subsystem name or handle
Examples

Copy the contents of vdp to an empty subsystem named vdp_subsystem that is in the model named new_model_with_vdp:

```matlab
open_system('vdp');
new_system('new_model_with_vdp')
open_system('new_model_with_vdp');
add_block('built-in/Subsystem', 'new_model_with_vdp/vdp_subsystem')
Simulink.BlockDiagram.copyContentsToSubsystem...
('vdp', 'new_model_with_vdp/vdp_subsystem')
```

“Create a Subsystem”

Introduced in R2007a
Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()

Description

Simulink.BlockDiagram.createSubsystem(blocks) creates a new subsystem and moves the specified blocks into the subsystem. All of the specified blocks must originally reside at the top level of the model or in the same existing subsystem within the model.

If any of the blocks have unconnected input ports, the command creates input port blocks for each unconnected input port in the subsystem and connects the input port block to the unconnected input port. The command similarly creates and connects output port blocks for unconnected output ports on the specified blocks. If any of the specified blocks is an input port, the command creates an input port block in the parent system and connects it to the corresponding input port of the newly created subsystem. The command similarly creates and connects output port blocks for each of the specified blocks that is an output port block.

Simulink.BlockDiagram.createSubsystem() creates a new subsystem in the currently selected model and moves the currently selected blocks in the current model to the new subsystem.

Input Arguments

blocks

An array of block handles

Default: []
Examples

This function converts the contents of a model or subsystem into a subsystem.

```matlab
function convert2subsys(sys)
    blocks = find_system(sys, 'SearchDepth', 1);
    bh = [];
    for i = 2:length(blocks)
        bh = [bh get_param(blocks{i}, 'handle')];
    end
    Simulink.BlockDiagram.createSubsystem(bh);
end
```

For example, suppose you create this model and save it as `initial_model.slx`.

Execute this code to convert the model to create a subsystem:

```matlab
convert2subsys('initial_model');
```

“Create a Subsystem”

Introduced in R2009a
Simulink.BlockDiagram.deleteContents

Delete contents of block diagram

Syntax

Simulink.BlockDiagram.deleteContents(bdiag)

Description

Simulink.BlockDiagram.deleteContents(bdiag) deletes the contents of the block diagram bdiag. The function affects only blocks, lines, and annotations. The block diagram must have already been loaded.

Input Arguments

bdiag

Block diagram name or handle

Examples

Delete the graphical content of an open block diagram named f14, including all subsystems:

load_system('f14')
Simulink.BlockDiagram.deleteContents('f14');

“Modeling”
“Create a Subsystem”

Introduced in R2007a
Simulink.BlockDiagram.getAlgebraicLoops

Show algebraic loops in a model

Syntax

Simulink.blockDiagram.getAlgebraicLoops(model)
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)

Description

Simulink.blockDiagram.getAlgebraicLoops(model) returns a list of algebraic loops in a model as a vector of AlgebraicLoops objects.

The Algebraic Loops viewer provides a tabular list of all algebraic loops in the model. Use the Algebraic Loops viewer to control the display of algebraic loops in your model.

[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)

Examples

Highlight all algebraic loops in model

Open the ex_sldemo_hydcyl model.

In the Diagnostics pane of Model Configuration Parameters, set Algebraic loop to none or warning. Setting this parameter to error prevents the model from compiling.

Compile the model without any errors. The model must compile before you can highlight any algebraic loops.

At the MATLAB command prompt, enter:

mdl = 'ex_sldemo_hydcyl';
load_system(mdl);
Simulink.BlockDiagram.getAlgebraicLoops(bdroot)
The resulting output shows that the model has one algebraic loop, which contains three blocks.

Running the `getAlgebraicLoops` function also opens the Algebraic Loop viewer. Use the Algebraic loop viewer to highlight specific algebraic loops in your model or all the loops.

The selected loops are highlighted in the corresponding model, in.
### Input Arguments

**model** — Model to highlight  
string scalar | character vector

Name of the model being tested, specified as a string scalar or character vector. You can also pass the most recently opened model using `bdroot`.

**Note** The model must be loaded into memory using either `open_system` or `load_system`.

Data Types: char | string

### Output Arguments

**loops** — Algebraic loops  
vector of `AlgebraicLoop` objects

Every algebraic loop in the model returned as an `AlgebraicLoop` object that contains the following information:
• **Model**—`Simulink.BlockDiagram` object representing the model
• **Id**—Index of the algebraic loop in the model
• **VariableBlockHandles**—Handles to blocks that have been assigned algebraic variables
• **BlockHandles**—Handles to all the blocks contained in the algebraic loop
• **IsArtificial**—Boolean value indicating whether the loop is an artificial algebraic loop.

**h** — **Handle to control UI**
`matlab.ui.Figure` handle

The control UI is a MATLAB figure window. Use the UI's handle h to control it programmatically. For more information, see Figure Properties.

**See Also**
ashow

“Remove Algebraic Loops”

**Introduced before R2006a**
Simulink.BlockDiagram.expandSubsystem

Replace subsystem with subsystem contents

**Syntax**

Simulink.BlockDiagram.expandSubsystem(block)

Simulink.BlockDiagram.expandSubsystem(block,'CreateArea',specifier)

**Description**

Simulink.BlockDiagram.expandSubsystem(block) expands the subsystem block into the system that contains the subsystem. Open or load the model first.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “Subsystems That You Can Expand”.

Simulink.BlockDiagram.expandSubsystem(block,'CreateArea',specifier) prevents creating an area around the expanded subsystem.

**Input Arguments**

**block** — Subsystem to expand

block path name | block handle

Subsystem to expand, specified as the block path name or block handle.

Example: 'sldemo_enginewc/Combustion'

**specifier** — Specify whether to create an area

'On' (default) | 'Off'

Option to specify whether to create an area, specified as 'On' to create the area, or 'Off' to not create the area.
Examples

Expand Subsystem

Open the model sldemo_enginewc. Expand the Combustion subsystem.

```matlab
open_system('sldemo_enginewc')
Simulink.BlockDiagram.expandSubsystem('sldemo_enginewc/Combustion')
```

The subsystem contents appear in the top level of the model.

Expand Subsystem Without Creating an Area

Expand the Combustion subsystem. The blocks and signals in the Combustion subsystem become part of the system and replace the Subsystem block.

Open the model sldemo_enginewc. Expand the Combustion subsystem but do not create an area.

```matlab
open_system('sldemo_enginewc')
Simulink.BlockDiagram.expandSubsystem('sldemo_enginewc/Combustion','CreateArea','Off')
```

Introduced in R2014a
Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

\[
[\text{checksum}, \text{details}] = \text{Simulink.BlockDiagram.getChecksum('model')}\]

Description

\[
[\text{checksum}, \text{details}] = \text{Simulink.BlockDiagram.getChecksum('model')}\]
returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see slAccelDemoWhyRebuild.

**Note** Simulink.BlockDiagram.getChecksum compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- **checksum** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **details** — Structure of the form

  ContentsChecksum: [1x1 struct]
  InterfaceChecksum: [1x1 struct]
  ContentsChecksumItems: [nx1 struct]
  InterfaceChecksumItems: [mx1 struct]

  - ContentsChecksum — Structure of the following form that represents a checksum that provides information about all blocks in the model.
Value: [4x1 uint32]
MarkedUnique: [bool]

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — True if any blocks in the model have a property that prevents code reuse.

**InterfaceChecksum** — Structure of the following form that represents a checksum that provides information about the model.

Value: [4x1 uint32]
MarkedUnique: [bool]

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — Always true. Present for consistency with **ContentsChecksum** structure.

**ContentsChecksumItems** and **InterfaceChecksumItems** — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for **ContentsChecksum** and **InterfaceChecksum**, respectively:

Handle: [char array]
Identifier: [char array]
Value: [type]

- **Handle** — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
- **Identifier** — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
- **Value** — Value of the item Simulink software added to the checksum. If the item is a parameter, **Value** is the value returned by `get_param(handle, identifier)`

**Simulink.BlockDiagram.getChecksum** returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:
• Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
• Code generation— in all other cases

To compile the model before calling Simulink.BlockDiagram.getChecksum, use this command:

`modelName([],[],[],'compile')`

**Note** The checksum that Simulink.BlockDiagram.getChecksum returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running Simulink.BlockDiagram.getChecksum.

**Tip**

The structural checksum reflects changes to the model that can affect the simulation results, including:

• Changing the solver type, for example from Variable-step to Fixed-step
• Adding or deleting blocks or connections between blocks
• Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
• Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
• Changing the number of states or the initial states in the model
• Selecting a different function in the Trigonometric Function block
• Changing signs used in a Sum block
• Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

• Changing the position of a block
• Changing the position of a line
• Resizing a block
• Adding, removing, or changing a model annotation
See Also
Simulink.SubSystem.getChecksum | Simulink.getFileChecksum

Introduced in R2006b
Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

x0 = Simulink.BlockDiagram.getInitialState('model')

Description

x0 = Simulink.BlockDiagram.getInitialState('model') returns the initial state data of the block diagram specified by the input argument model. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the LoadInitialState model argument or the Data Import/Export > Initial state configuration parameter.

To specify the format for the initial state data, use the SaveFormat model argument. The default format is 'Dataset'. Other formats 'Array', 'Structure', and 'StructureWithTime'. Alternatively, you can set the initial state format using the Data Import/Export > Format configuration parameter.

- If format is 'Dataset', then the Simulink.BlockDiagram.getInitialState function returns a Simulink.SimulationData.Dataset object.
- For other format settings, the function returns a structure of the form:

  time: 0
  signals: [1xn struct]

  where n is the number of states contained in the model, including any models referenced by Model blocks. The signals field is a structure of the form:

  values: [1xm double]
  dimensions: [1x1 double]
  label: [char array]
  blockName: [char array]
  inReferencedModel: [bool]
  sampleTime: [1x2 double]
• **values** — Numeric array of length m, where m is the number of states in the signal
• **dimensions** — Length of the values vector
• **label** — Indication of whether the state is continuous (CSTATE) or discrete. If the state is discrete:

  The name of the discrete state is shown for S-function blocks.

  The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

  DSTATE is used in all other cases.

• **blockName** — Full path to block associated with this state
• **inReferencedModel** — Indication of whether the state originates in a model referenced by a Model block (1) or in the top model (0)
• **sampleTime** — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

“Initial state”
“Format”

**Introduced in R2006b**
Simulink.BlockDiagramSAMPLE_TIMES

Return all sample times associated with model

Syntax

ts = Simulink.BlockDiagram.getSampleTimes('model')

Description

ts = Simulink.BlockDiagram.getSampleTimes('model') performs an update diagram and then returns the sample times associated with the block diagram model. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

model
    Name or handle of a Simulink model

Output Arguments

ts
    The command returns a 1xn array of Simulink.SampleTime objects associated with the model passed to Simulink.BlockDiagram.getSampleTimes. Here n is the number of sample times associated with the block diagram. The format of the returns is as follows:

    1xn Simulink.SampleTime

Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]

Methods

• value — A two-element array of doubles that contains the sample time period and offset.
• Description — A character vector or string that describes the sample time type.
• ColorRGBValue — A 1x3 array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
• Annotation — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1').
• OwnerBlock — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
• ComponentSampleTimes — A structure array of elements of the same type as Simulink.BlockDiagram.getSampleTimes if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

See Also
Simulink.Block.getSampleTimes

Introduced in R2009a
Simulink.BlockDiagram.loadActiveConfigSet

**Package:** Simulink.BlockDiagram

Load, associate, and activate configuration set with model

**Syntax**

Simulink.BlockDiagram.loadActiveConfigSet(model, filename)

**Description**

Simulink.BlockDiagram.loadActiveConfigSet(model, filename) loads a configuration set, associates it with a model, and makes it the active configuration set. model is the name or handle of a model. filename is the name of the file (.m or .mat) that creates or contains a configuration set object to load. If you do not provide a file extension, it defaults to .m. If the file name is the same as a model name on the MATLAB path, the software cannot determine which file contains the configuration set object and displays an error message.

**Examples**

Save the configuration set from the sldemo_counters model to my_config_set.m.

% Open the sldemo_counters model  
sldemo_counters  
% Save the active configuration set to my_config_set.m  
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')

Load the configuration set from my_config_set.m, associate it with the vdp model, and make it the active configuration set.

% Open the vdp model  
vdp  
% Load the configuration set from my_config_set.m, making it the active  
% configuration set for vdp.  
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'my_config_set.m')
Tips

• If you load a configuration set with the same name as the active configuration set, the software overwrites the active configuration set.

• If you load a configuration set with the same name as an inactive configuration set associated with the model, the software detaches the inactive configuration from the model.

• If you load a configuration set object that contains an invalid custom target, the software sets the “System target file” (Simulink Coder) parameter to ert.tlc.

Introduced in R2010b
Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

- `[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

- `[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

- `[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

- `handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the Configuration Reference Propagation to Referenced Models dialog box.
Examples

Propagate a Configuration Reference to All Referenced Models

```matlab
[isPropagated,convertedModels] = ... Simulink.BlockDiagram.propagateConfigSet('sldemo_mdlref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```matlab
[isPropagated,convertedModels] = ... Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','include',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```matlab
[isPropagated,convertedModels] = ... Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','exclude',...
{'sldemo_mdlref_heater','sldemo_mdlref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```matlab
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdlref_depgraph','gui')
```

Input Arguments

`model` — Top model
character vector | string scalar

Top model with configuration reference to propagate, specified as a character vector or string scalar:
Example: `‘mdl’`
**refModels — Referenced models**
cell array of character vectors | string array

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors or string array.
Example: {'mdl1','mdl2','mdl3'}

**Output Arguments**

**isPropagated — Success of propagation**
false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

**convertedModels — Converted models**
cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

**handle — Handle to dialog box**
handle

Handle to the `Configuration Reference Propagation to Referenced Models` dialog box. Returned when you specify the ‘gui’ argument to the function.

**See Also**
Simulink.BlockDiagram.restoreConfigSet

**Topics**
“Share a Configuration Across Referenced Models”
“Manage a Configuration Reference”

**Introduced in R2012b**
Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

\[ [\text{isRestored}, \text{restoredModels}] = \text{Simulink.BlockDiagram.restoreConfigSet}(\text{model}) \]

Description

\[ [\text{isRestored}, \text{restoredModels}] = \text{Simulink.BlockDiagram.restoreConfigSet}(\text{model}) \]
restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

Examples

Restore the Model Configuration for Converted Models

\[ [\text{isRestored}, \text{restoredModels}] = \ldots \]
\[ \text{Simulink.BlockDiagram.restoreConfigSet('sldemo_mdlref_depgraph')}; \]

Input Arguments

\textbf{model — Top model}  
character vector | string scalar

Name of top model, specified as a character vector or string scalar.

Example: ‘mdl’
Output Arguments

**isRestored — Success of restoration**
false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

**restoredModels — Restored models**

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

“Manage a Configuration Reference”

Introduced in R2012b
Simulink.BlockDiagram.routeLine

Route existing lines of a model

Syntax

Simulink.BlockDiagram.routeLine(lineHandles)
Simulink.BlockDiagram.routeLine('DeferredLines')

Description

Simulink.BlockDiagram.routeLine(lineHandles) takes an array of existing line handles as input and routes the corresponding lines. Routing existing lines improves line route quality and avoids overlaps of a line with other lines and obstacles in the model.

To find the line handles in the model you want to route, use the find_system or get_param function.

Simulink.BlockDiagram.routeLine('DeferredLines') performs all line updates that the LineUpdate model parameter defers while a script runs. For this command to route lines, all of these conditions must apply:

- The LineUpdate model parameter is set to 'deferred'.
- The script that contains this command affects line routing before using this command.
- If the script saves models, the script affects line routing after using the save_system function and before using this command.

Examples

Route Existing Lines of Model

This example shows how to route existing lines of a model that overlap with other lines and blocks in the model.
Open the model `ex_route_lines`.

```matlab
open_system('ex_route_lines');
```

The two lines in the top-level system overlap with each other and with a block. To route these lines, create an array of line handles by using `find_system`. Then call `Simulink.BlockDiagram.routeLine` with this array as input.

```matlab
lineHandles = find_system(gcs,'FindAll','On','SearchDepth',1,'Type','Line'); Simulink.BlockDiagram.routeLine(lineHandles);
```

The updated model has no overlaps.
Route Lines Affected by Script

When the LineUpdate model parameter is set to 'deferred', scripts postpone line routing until they pause, complete, or run the Simulink.BlockDiagram.routeLine('DeferredLines') command.

Model ex_route_deferred_lines contains virtual subsystems with numerous signal lines connecting them.

To see how the Simulink.BlockDiagram.routeLine('DeferredLines') command works with the LineUpdate model parameter, set this parameter to 'deferred'.

set_param(0,'LineUpdate','deferred');

Capture Image Before Routing Deferred Lines

Run a MATLAB® script that loads the model, moves blocks within the model, and saves an image of the model.

load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
print('-s','deferred_lines_unrouted','-dpng');
Because the script saves an image of the model before the deferred lines are routed, lines overlap other lines and obstacles in the model.

**Capture Image After Routing Deferred Lines**

Run a MATLAB script that loads the original model, moves blocks within the model, updates affected line routing, and saves an image of the model.

```matlab
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
Simulink.BlockDiagram.routeLine('DeferredLines');
print('-s','deferred_lines_routed','-dpng');
```
Adding command `Simulink.BlockDiagram.routeline('DeferredLines')` before the `print` function improves line routing in the saved image.

**Input Arguments**

`lineHandles` — Handles of lines to route
array of line handles

Handles of the lines to route, specified as an array of line handles. To find the line handles in your model, use the `find_system` or `get_param` function.

Data Types: `double`

**Limitations**

- Line routing can require additional empty space on the Simulink canvas. If the canvas does not have the required empty space, using `Simulink.BlockDiagram.routeLine` might not improve line route quality.
• For large models with many lines to route, `Simulink.BlockDiagram.routeLine` can take several minutes to execute.

**See Also**

`Simulink.BlockDiagram.arrangeSystem` | `find_system` | `get_param`

**Topics**

**Introduced in R2019a**
Simulink.BlockDiagram.saveActiveConfigSet

**Package:** Simulink.BlockDiagram

Save active configuration set of model

**Syntax**

Simulink.BlockDiagram.saveActiveConfigSet(model, filename)

**Description**

Simulink.BlockDiagram.saveActiveConfigSet(model, filename) saves the active configuration set of a model to a .m or .mat file. **model** is the name or handle of the model. **filename** is the name of the file to save the model configuration set. If you specify a .m extension, the file contains a function that creates a configuration set object. If you specify a .mat extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a .m extension. Do not specify **filename** to be the same as a model name; otherwise, the software cannot determine which file contains the configuration set object when loading the file.

**Note** If you specify a .mat extension when you save the active configuration set, all of the parameters are preserved. If you specify a .m extension, the .m file does not include hidden or disabled parameters.

**Examples**

Save the configuration set from the sldemo_counters model to my_config_set.m.

```matlab
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

Topics
“Save a Configuration Set”

Introduced in R2010b
Simulink.Bus.cellToObject

Package: Simulink.Bus

Convert cell array containing bus information to bus objects

Syntax

Simulink.Bus.cellToObject(busCells)

Description

Simulink.Bus.cellToObject(busCells) creates a set of bus objects in the MATLAB base workspace from a cell array of bus information.

Examples

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

busCell = { ... 
    { ... 
        'myBusObj', ... 
        'MyHeader.h', ... 
        'My description', ... 
        'Exported', ... 
        '-1', ... 
       ('{{'a',1,'double', [0.2 0],'real','Sample'}; ... 
        {{'b',1,'double', [0.2 0],'real','Sample',... 
        'Fixed','-3,3','m','b is distance from the origin'}}),... 
    }, ... 
};
Generate a bus object in the base workspace from the cell array.

Simulink.Bus.cellToObject(busCell)

### Input Arguments

**busCells — Bus object information**

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array must contain this bus object information:

1. Bus name
2. Header file
3. Description
4. Data scope
5. Alignment
6. Elements

The elements field is an array that must contain this data for each element:

1. Element name
2. Dimensions
3. Data type
4. Sample time
5. Complexity
6. Sampling mode

The elements field array can also contain this data:

1. Dimensions mode
2. Minimum
3. Maximum
4. Units
5. Description
Tips

The inverse function is `Simulink.Bus.objectToCell`.

Compatibility Considerations

**Simulink.BusElement objects will no longer support the SampleTime property**

_Not recommended starting in R2019b_

In a future release, the `SampleTime` property of `Simulink.BusElement` objects will be removed.

To prepare:

- When defining `BusElement` objects, use the default `SampleTime` value (-1).
- To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

**Simulink.BusElement objects will no longer support the SamplingMode property**

_Not recommended starting in R2016b_

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Functions

Topics
“Specify Bus Properties with Bus Objects”
“Create Bus Objects Programmatically”
“Create and Specify Bus Objects”
“Save Bus Objects”

Introduced before R2006a
Simulink.Bus.createMATLABStruct

Package: Simulink.Bus

Create MATLAB structures using same hierarchy and attributes as bus signals

Syntax

structFromBus = Simulink.Bus.createMATLABStruct(busSource)
structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues)
structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues, dims)

structsForBuses = Simulink.Bus.createMATLABStruct(portHandles)
structsForBuses = Simulink.Bus.createMATLABStruct(portHandles, partialStructures)
structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames)

Description

structFromBus = Simulink.Bus.createMATLABStruct(busSource) creates a MATLAB structure that has the same hierarchy and attributes (such as type and dimension) as the bus specified in busSource. The resulting structure uses the ground values of the bus signal.

structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues) creates a structure that uses specified values of partialValues instead of the corresponding ground values of the bus signal.

structFromBus = Simulink.Bus.createMATLABStruct(busSource, partialValues, dims) creates a structure that has the specified dimensions. To create a structure for an array of buses, use dims.

structsForBuses = Simulink.Bus.createMATLABStruct(portHandles) creates a cell array of structures for bus signal ports, specified with port handles. The resulting cell array of structures uses ground values. Use this syntax to create initialization
structures for multiple bus ports. This syntax improves performance compared to using separate Simulink.Bus.createMATLABStruct calls to create the structures.

\[
\text{structsForBuses} = \text{Simulink.Bus.createMATLABStruct}(\text{portHandles}, \text{partialStructures})
\]
creates a cell array of structures that uses the specified values of \text{partialStructures} instead of the ground values.

\[
\text{structsForBuses} = \text{Simulink.Bus.createMATLABStruct}(\text{busObjectNames})
\]
creates a cell array of structures based on the specified bus objects.

**Examples**

**Create MATLAB Structure from Bus Object**

Open and simulate model \text{ex_bus_initial_conditions}.

\[
\text{open_system('ex_bus_initial_conditions')} \\
\text{sim('ex_bus_initial_conditions');}
\]
Create a MATLAB structure using bus object `Top`, which model
`ex_bus_initial_conditions` loads.

```matlab
mStruct = Simulink.Bus.createMATLABStruct('Top');
```

Set a value for the field of the `mStruct` structure that corresponds to bus element `A1` of
bus `A`.

```matlab
mStruct.A.A1 = 3;
```

```matlab
ans =

    struct with fields:
```

2-633
Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use `mStruct` as the initial condition structure for the Unit Delay block.

### Initialize Signal Elements that Use a Data Type Other than Double

Create a MATLAB structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the partial structure, match the data types of the fields with the data types of the corresponding elements.

Open and simulate model `ex_bus_initial_conditions`.

```matlab
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```
The C1 signal element that the block labeled Constant5 produces uses the data type int16.

Find the port handle for the Bus Creator block port that produces the Top bus signal.

\[ \text{ph} = \text{get_param('ex_bus_initial_conditions/TopBus','PortHandles');} \]

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the C.C1 field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (int16).

\[ \text{PartialstructForK} = \text{struct('B',3,'C',struct('C1',\text{int16}(5))}); \]

Create a full structure by using the port handle (ph) for the TopBus block. Override the ground values for the C.C1 and B elements.
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);

The field C.C1 in the output structure continues to use the data type int16.

**Create MATLAB Structure with Specified Dimensions**

Open and simulate model ex_bus_initial_conditions.

```matlab
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Create a partial structure for a subset of bus elements in the bus created by the TopBus block.
PartialStructForK = struct('A',struct('A1',4),'B',3)

PartialStructForK =
    struct with fields:
    A: [1x1 struct]
    B: 3

Create a MATLAB structure using bus object Top, a partial structure, and dimensions for the resulting structure.

structFromBus = Simulink.Bus.createMATLABStruct...
               ('Top',PartialStructForK,[2 3])

structFromBus =
    2x3 struct array with fields:
    A
    B
    C

Create Cell Array of MATLAB Structures

To create initialization structures for multiple bus ports, specify port handles as arguments for Simulink.Bus.createMATLABStruct. The resulting cell array of structures uses ground values.

Open and simulate model ex_two_outports_create_struct.

open_system('ex_two_outports_create_struct')
sim('ex_two_outports_create_struct');
Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```matlab
ph_1 = get_param...
     ('ex_two_outports_create_struct/Bus Creator','PortHandles');
ph_2 = get_param...
     ('ex_two_outports_create_struct/Bus Creator1','PortHandles');

Create a MATLAB® structure using an array of port handles.

mStruct = Simulink.Bus.createMATLABStruct([ph_1.Outport ph_2.Outport])

mStruct =

2x1 cell array

{1x1 struct}
{1x1 struct}
Create MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of the bus elements in the bus that connects to the port.

Open and simulate model `ex_bus_initial_conditions`.

```matlab
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Find the port handle for the Bus Creator block port that produces the Top bus signal. The `Outport` handle is the handle that you need.

```matlab
ph = get_param('ex_bus_initial_conditions/TopBus','PortHandles')
```
Create a partial structure for the bus signal created by the TopBus block. You can use a partial structure to specify values for a subset of bus elements.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)
```

Bus elements represented by structure fields Top.B and Top.A are at the same level in the bus hierarchy. You can use this partial structure to override the ground values for the B and A bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (ph) for the TopBus block. Override the ground values for the A.A1 and B bus elements.

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialStructForK)
```
struct with fields:

A: [1x1 struct]
B: 3
C: [1x1 struct]

**Input Arguments**

**busSource** — Source representing a bus signal

A Simulink.Bus object | port handle

Source representing a bus signal to use for creating a MATLAB structure, specified as the name of a bus object or port handle.

- If you use the `dims` argument, then for `busSource`, use a bus object.
- For an array of buses signal, you cannot use a port handle.
- If you use a bus object name, then the bus object must be in the MATLAB base workspace. The data type for the bus object name is `char`.
- If you use a port handle, then the model must compile successfully before you use the `Simulink.Bus.createMATLABStruct` method. The data type for the port handle is a `double`.

Example: `structFromBus = Simulink.Bus.createMATLABStruct('myBusObject')`

Example: `structForPortHandle = Simulink.Bus.createMATLABStruct(port_handle_1)`

**partialValues** — Values for a subset of leaf nodes of the resulting structure

Partial structure | []

Values for a subset of leaf nodes of the resulting structure, specified as a partial structure or empty array. Each field that you specify in a partial structure must match the data attributes of the corresponding bus element exactly. For details, see “Create Partial Structures for Initialization”.

Use an empty matrix [] when you use the `dims` argument and want to use ground values for all of the nodes in the resulting structure.

Data Types: `struct`
**dims — Dimensions of the resulting structure**
vector

Dimensions of the resulting structure, specified as a vector. Each dimension element must be an integer that is greater than or equal to 1. If you specify `partialValues`, then each dimension element in `dims` must be greater than or equal to its corresponding dimension element in the partial structure.

To use ground values, use an empty matrix ([]) for `partialValues`.

Data Types: double

**portHandles — Handles of bus signal ports**
array

Handles of bus signal ports, specified as an array. If you use the `partialStructures` argument, then the number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: double

**partialStructures — Partial structures**
cell array

Partial structures specified as a cell array. The number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: cell

**busObjectNames — Bus object names**
cell array

Bus object names, specified as a cell array.

Data Types: cell

### Output Arguments

**structFromBus — Bus signal hierarchy and attributes**
MATLAB structure

Bus signal hierarchy and attributes, returned as a MATLAB structure.
The dimensions of `structFromBus` depend on the input arguments:

- If you specify only `busSource`, then the dimension is 1.
- If you also specify `partialValues`, then the dimensions match the dimensions of `partialValues`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

`structsForBuses — Structures having the same hierarchy and attributes as bus signals  
cell array  
`  
Structures with the same hierarchy and attributes as bus signals, returned as a cell array of structures of data with same hierarchy and attributes as a bus signals that you specify with an array of port handles. The cell array of structures uses ground values of the bus signals.

The dimensions of `StructsForBuses` depend on the input arguments:

- If you specify only `portHandles`, then the dimension is 1.
- If you also specify `partialStructures`, then the dimensions match the dimensions of `partialStructures`.

**Tips**

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in `compile` before using the function multiple times. For example, to put the `vdp` model in `compile`, use this command:

  \[ \text{sys}, \text{x0}, \text{str}, \text{ts} = \text{vdp}([],[],[],'compile') \]

  After you create the MATLAB structure, terminate the compile. For example:

  \[ \text{vdp}([],[],[],'term') \]

- You can use the Bus Editor to invoke the `Simulink.Bus.createMATLABStruct` function. Use one of these approaches:

  - Select the **File > Create a MATLAB structure** menu item.
• Select the bus object for which you want to create a full MATLAB structure. Then, in the toolbar, click the **Create a MATLAB structure** button (겠습니다).

You can then edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

• You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the “Referenced Model: Setting Initial Value for Bus Output” section of the Detailed Workflow for Managing Data with Model Reference example.

`Simulink.Bus` | `Simulink.BusElement`

**Functions**

**Topics**
“Types of Composite Signals”
“Specify Initial Conditions for Bus Signals”

**Introduced in R2010a**
Simulink.Bus.createObject

**Package:** Simulink.Bus

Create bus objects from blocks or MATLAB structures

**Syntax**

```matlab
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject(____,file)
busInfo = Simulink.Bus.createObject(____,format)
```

**Description**

`busInfo = Simulink.Bus.createObject(model,blocks)` creates `Simulink.Bus` objects for specified blocks and returns information about the created bus objects. These bus objects go in the MATLAB base workspace or, if available, the data dictionary used by the model.

`busInfo = Simulink.Bus.createObject(struct)` creates bus objects from a structure that can contain MATLAB timeseries, MATLAB timetable, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure. These bus objects go in the MATLAB base workspace or, if available, the data dictionary used by the model.

`busInfo = Simulink.Bus.createObject(____,file)` saves the bus objects in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
• Elements

The elements field is an array containing this data for each element:

• Element name
• Dimensions
• Data type
• Sample time
• Complexity
• Dimensions mode
• Minimum
• Maximum
• Units
• Description

`busInfo = Simulink.Bus.createObject(___,'format')` saves the bus objects in a file that contains either a cell array of bus information, or the bus objects themselves.

## Examples

### Create a Bus Object from a Bus Creator Block

Open the model.

`open_system('busdemo')`

Create a bus object that corresponds with the bus created by the Bus Creator2 block.

`bus2Info = Simulink.Bus.createObject...('busdemo','busdemo/Bus Creator2')`

### Create and Save Bus Objects to a File

Create a bus object from two Bus Creator blocks, using block handles to specify the blocks. Assign the block handles to variables and use the variables in a vector to specify the blocks used for creating the bus object.
Open the model.

```matlab
open_system('busdemo')
```

In the Simulink Editor, select the Bus Creator2 block.

In MATLAB, assign the block handle to a variable.

```matlab
bc2 = gcbh;
```

In the Simulink Editor, select the Bus Creator block.

In MATLAB, assign the block handle to a variable.

```matlab
bc1 = gcbh;
```

To create a bus object, use the block handle variables in a vector.

```matlab
busInfo = Simulink.Bus.createObject
('busdemo', [bc2 bc1], 'busdemo_busobject')
```

## Input Arguments

- **model** — Model name or handle  
  character vector

  Model name or handle, specified as a character vector.

- **blocks** — Blocks to create bus objects for  
  character vector | cell array of block path names | vector of block handles

  Blocks to create bus object for, specified as a character vector, cell array of block path names, or vector of block handles.

  - For just one block, specify the full path name of the block.
  - For multiple blocks, specify either a cell array of block path names or a vector of block handles.
  - If you specify a Bus Creator block that is at the highest level of a bus hierarchy, the function creates bus objects for all buses in the hierarchy.
**struct — Structure used to create bus objects**
structure of MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects | numeric structure

Structure used to create bus objects, specified as a structure that can contain MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects or a numeric structure.

**file — MATLAB file used to save bus object definitions**
character vector

MATLAB file used to save bus object definitions, specified as a character vector. The file name must be unique.

**format — Format for storing bus objects in file**
'cell' (default) | 'object'

Format for storing bus objects in file, specified as either 'cell' or 'object'. The cell format is more compact, but the object format is easier to read.

**Output Arguments**

**busInfo — Bus information for specified blocks**
structure array

Bus information for specified blocks, returned as a structure array. Each element of the structure array corresponds to one block and contains these fields:

- block — Handle of the block
- busName — Name of the bus object associated with the block

**Tips**

If you specify a model name, the model must compile successfully before you use the Simulink.Bus.createObject command.
Compatibility Considerations

Simulink.BusElement objects will no longer support the SampleTime property
Not recommended starting in R2019b

In a future release, the SampleTime property of Simulink.BusElement objects will be removed.

To prepare:

• When defining BusElement objects, use the default SampleTime value (-1).
• To specify the sample time for an element of a bus, use the SampleTime block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

Introduced before R2006a
Simulink.Bus.objectToCell

**Package:** Simulink.Bus

Use bus objects to create cell array containing bus information

**Syntax**

```matlab
cells = Simulink.Bus.objectToCell(busNames)
cells = Simulink.Bus.objectToCell(busNames,scope)
```

**Description**

`cells = Simulink.Bus.objectToCell(busNames)` creates a cell array of bus information from a set of bus objects in the MATLAB base workspace. The cell array contains subordinate cell arrays that define each bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

`cells = Simulink.Bus.objectToCell(busNames,scope)` creates a cell array of bus information from a set of bus objects in a data dictionary. The cell array contains subordinate cell arrays that define each bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

**Examples**

**Create Cell Array Containing Bus Object Information**

Use the `Simulink.Bus.objectToCell` function to create a cell array of information about bus objects in the base workspace.

Open a model that has two bus objects defined, CONTROL and MAIN.

```matlab
open_system(fullfile(matlabroot,'examples','simulink','ex_bus_object_tutorial_using_objects'))
```
Create a cell array of information about the CONTROL bus object.

```matlab
cells = Simulink.Bus.objectToCell({'CONTROL'});
cells{1}
```

```
ans =
1x6 cell array
{'CONTROL'}    {0x0 char}    {0x0 char}    {'Auto'}    {'-1'}    {2x1 cell}
```

### Input Arguments

**busNames — Names of bus objects**
cell array of bus object names

Bus objects for which to create cell arrays of bus object information, specified as a cell array. Specify the bus object names as character vectors. If `busNames` is empty, the function converts all bus objects in the base workspace or data dictionary.

Example: `cells = Simulink.Bus.objectToCell({'busObject'})`
**scope** — Data dictionary that contains bus objects
Simulink.data.Dictionary object

Data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

If scope is empty, the function uses the MATLAB base workspace as the source of the bus objects.

Example: `cells = Simulink.Bus.objectToCell({},dataDictionaryObject)`

## Output Arguments

**cells** — Bus object information
cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains this bus object information:

1. Bus name
2. Header file
3. Description
4. Data scope
5. Alignment
6. Elements

The elements field is an array that contains this data for each bus element:

1. Bus element name
2. Dimensions
3. Data type
4. Sample time
5. Complexity
6. Sampling mode

The elements field also contains this data if available:
1 Dimensions mode
2 Minimum
3 Maximum
4 Units
5 Description

**Tips**

The inverse function is `Simulink.Bus.cellToObject`.

**Compatibility Considerations**

**Simulink.BusElement objects will no longer support the SampleTime property**  
*Not recommended starting in R2019b*

In a future release, the `SampleTime` property of `Simulink.BusElement` objects will be removed.

To prepare:

- When defining `BusElement` objects, use the default `SampleTime` value (`-1`).
- To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

**Simulink.BusElement objects will no longer support the SamplingMode property**  
*Not recommended starting in R2016b*

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.
In a future release, support for the SamplingMode property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

Functions

Topics
“Specify Bus Properties with Bus Objects”
“Create Bus Objects Programmatically”
“Create and Specify Bus Objects”
“Save Bus Objects”

Introduced in R2007a
Simulink.Bus.save

Package: Simulink.Bus

Save bus objects in MATLAB file

Syntax

Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)

Description

Simulink.Bus.save(fileName) saves all bus objects (instances of Simulink.Bus class) that are in the MATLAB base workspace in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The elements field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
• Minimum
• Maximum
• Units
• Description

Simulink.Bus.save(fileName, format) saves the bus objects in a MATLAB file that contains either a cell array of bus information or the bus objects themselves.

Simulink.Bus.save(fileName, format, busNames) saves only those bus objects whose names appear in busNames.

**Examples**

**Save a Bus Object**

Use the Simulink.Bus.save function to save a bus object.

Define a cell array of bus object information.

```matlab
busCell = { ... 
    { ... 
    'myBusObj', ..., 
    'MyHeader.h', ..., 
    'My description', ..., 
    'Exported', ..., 
    '-1', ..., 
    {{'a',1,'double',[0.2 0],'real','Frame'}; ... 
    {'b',1,'double',[0.2 0],'real','Sample'}}, ... 
    }, ... 
};
```

Create `myBusObj` bus object from the cell array.

Simulink.Bus.cellToObject(busCell);

Save the bus object in the `BusCellFile1` file, in cell format.

```matlab
fileName = 'BusCellFile1';
Simulink.Bus.save(fileName);
```

Save the bus object in bus format.
Simulink.Bus.save('BusObjFile','object');

Save myBusObj in cell format in BusCellFile2.m.

Simulink.Bus.save('BusCellFile2','cell',{myBusObj});

### Input Arguments

**fileName** — File in which to store bus objects  
character vector

File in which to store bus objects, specified as a character vector.

**format** — Format for storing bus objects in file  
'cell' (default) | 'object'

Format for storing bus objects in file, specified as either 'cell' or 'object'. The cell format is more compact, but the object format is easier to read.

**busNames** — Bus objects to save  
cell array of bus objects

Bus objects to save, specified as a cell array of bus objects. Only the specified bus objects in the base workspace are saved.

### Tips

Executing a MATLAB file created by Simulink.Bus.save in cell array format calls Simulink.Bus.cellToObject to recreate the bus objects and returns the new bus objects in the cell array. To suppress the creation of bus objects, specify the optional argument 'false' when you execute the MATLAB file.
Compatibility Considerations

Simulink.BusElement objects will no longer support the SampleTime property
Not recommended starting in R2019b

In a future release, the SampleTime property of Simulink.BusElement objects will be removed.

To prepare:

• When defining BusElement objects, use the default SampleTime value (-1).
• To specify the sample time for an element of a bus, use the SampleTime block parameter of corresponding blocks. For example, you can use In Bus Element, Out Bus Element, and Signal Specification blocks to specify sample time.

Introduced before R2006a
Simulink.clearIntEnumType

Delete enumeration classes defined by Simulink.defineIntEnumType

Syntax

Simulink.clearIntEnumType(typeName)
Simulink.clearIntEnumType()

Description

Simulink.clearIntEnumType(typeName) deletes a specific enumeration class that is defined by Simulink.defineIntEnumType. The function generates a warning if the class name is invalid or if a class cannot be deleted because instances of the class exist.

Simulink.clearIntEnumType() deletes all enumeration classes that are defined by Simulink.defineIntEnumType. The function generates a warning if a class cannot be deleted because instances of the class exist.

Examples

Delete a Specific Dynamic Enumerated Data Type

Define an enumeration type and confirm that it has been created.

Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
myResult = Simulink.findIntEnumType('myEnumType')

Delete the enumeration type that you created and confirm that it is no longer there.

Simulink.clearIntEnumType('myEnumType');
myResult = Simulink.findIntEnumType('myEnumType')
Delete All Dynamic Enumerated Data Types

Define two enumeration types and confirm that they have been created.

```matlab
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
myResult = Simulink.findIntEnumType()
```

Delete all enumeration types and confirm that no enumeration types exist.

```matlab
Simulink.clearIntEnumType();
myResult = Simulink.findIntEnumType()
```

### Input Arguments

typeName — Name of enumeration class
character vector or string

Name of a specific enumeration class that is defined by Simulink.defineIntEnumType, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

### See Also

```matlab
enumeration | Simulink.defineIntEnumType | Simulink.findIntEnumType
```

Introduced in R2018b
Simulink.createFromTemplate

Create model or project from template

Syntax

Simulink.createFromTemplate(templatename)

h = Simulink.createFromTemplate(templatename)

h = Simulink.createFromTemplate(templatename,Name,Value)

Description

Simulink.createFromTemplate(templatename) creates a model or a project from the template file specified by templatename.

h = Simulink.createFromTemplate(templatename) creates a model or a project from the template file and returns h, either a numeric model handle or a simulinkproject object.

h = Simulink.createFromTemplate(templatename,Name,Value) specifies additional options as one or more Name, Value pair arguments.

Examples

Create a Model From a Template

Simulink.createFromTemplate('simple_simulation.sltx')

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a simulinkproject object) for manipulating it programmatically.
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','Folder','C:\Work\project1')

## Input Arguments

templatename — Template file name
character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and *.sltx extension.

Example:

Data Types: char

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example:

**Folder** — Project root folder
character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: char

**Name** — New model or project name
character vector

New model or project name, specified as a character vector.

Data Types: char

## Output Arguments

**h** — Handle
numeric handle | simulinkproject
Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

**See Also**
Simulink.defaultModelTemplate | Simulink.exportToTemplate | Simulink.findTemplates

**Introduced in R2016a**
Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

Simulink.data.assigninGlobal(modelName, varName, varValue)

Description

Simulink.data.assigninGlobal(modelName, varName, varValue) assigns the value varValue to the variable or data dictionary entry varName in the context of the Simulink model modelName. assigninGlobal creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, assigninGlobal searches for varName in the entire dictionary hierarchy. If assigninGlobal does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable myNewVariable with value 237 in the context of the Simulink model vdp.slx, which is not linked to any data dictionary. myNewVariable appears as a variable in the MATLAB base workspace.

Simulink.data.assigninGlobal('vdp', 'myNewVariable', 237)

Create a variable myNewEntry with value true in the context of the Simulink model sldemo_fuelsys_dd_controller.slx, which is linked to the data dictionary
sldemo_fuelsys_dd_controller.sldd. The entry myNewEntry appears in the Design Data section of the dictionary.

Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',... 'myNewEntry',true)

Confirm the addition of myNewEntry to the data dictionary sldemo_fuelsys_dd_controller.sldd by viewing the dictionary in Model Explorer.

myDictionaryObj = Simulink.data.dictionary.open(... 'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)

**Input Arguments**

**modelName** — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

**varName** — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

**varValue** — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5
Example: myBaseWorkspaceVariable
Example: Simulink.Parameter
Tips

- `assigninGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”
“Considerations before Migrating to Data Dictionary”

 Introduced in R2015a
Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

Simulink.data.dictionary.cleanupWorkerCache

Description

Simulink.data.dictionary.cleanupWorkerCache restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a spmd block, after you finish parallel simulation using parfor blocks, to restore default settings that were altered by the Simulink.data.dictionary.setupWorkerCache function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function Simulink.data.dictionary.setupWorkerCache grants each worker a unique dictionary cache to allow independent access to the data, and the function Simulink.data.dictionary.cleanupWorkerCache restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a parfor block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a Simulink.Parameter object whose value influences the variant condition of a Simulink.Variant object) that you
store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use Simulink.SimulationInput objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1: numberOfSims
% Create objects to interact with dictionary data
% You must create these objects for every iteration of the parfor-loop
dictObj = Simulink.data.dictionary.open(dd);
sectObj = getSection(dictObj,'Design Data');
entryObj = getEntry(sectObj,'MODE');
% Suppose MODE is a Simulink.Parameter object stored in the data dictionary

% Modify the value of MODE
temp = getValue(entryObj);
temp.Value = CtrlValues(index);
setValue(entryObj,temp);

% Simulate and store simulation output in the nondistributed array
simOut{index} = sim(model);
% Each worker must discard all changes to the data dictionary and close the dictionary when finished with an iteration of the parfor-loop
discardChanges(dictObj);
close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end

---

**Note** If data dictionaries are open, you cannot use the command Simulink.data.dictionary.cleanupWorkerCache. To identify open data dictionaries, use Simulink.data.dictionary.getOpenDictionaryPaths.

---

“Run Code on Parallel Pools” (Parallel Computing Toolbox)

**Introduced in R2015a**
Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll(____,unsavedAction)

Description

Simulink.data.dictionary.closeAll attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as Simulink.data.Dictionary, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as Simulink.data.dictionary.cleanupWorkerCache, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the close method of a Simulink.data.Dictionary object. To find dictionaries that are open, use Simulink.data.dictionary.getOpenDictionaryPaths. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a project.

Simulink.data.dictionary.closeAll(dictFileName) closes all connections to the dictionary named dictFileName. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify dictFileName as a full file path such as 'C:\temp\myDict.sldd'.

Simulink.data.dictionary.closeAll(____,unsavedAction) closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.
Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

Simulink.data.dictionary.closeAll('-discard')

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a Simulink.data.Dictionary object that refers to the dictionary.

dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');

Display the dictionary in the Model Explorer

show(dictObj)

You now have two connections to this dictionary: The Simulink.data.Dictionary object and the Model Explorer.

Make a change to the dictionary by adding an entry.

dDataSectObj = getSection(dictObj,'Design Data');
addEntry(dDataSectObj,'myEntry',5.2);

The Simulink.data.dictionary.Section object dDataSectObj is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.sldd','-discard')

The dictionary no longer appears as a node in the Model Hierarchy pane of the Model Explorer. The Simulink.data.Dictionary object dictObj is disconnected from the
dictionary. You cannot interact with the dictionary by using the
Simulink.data.dictionary.Section object dDataSectObj.

Clear the objects that referred to the dictionary.

clear dictObj dDataSectObj

**Input Arguments**

dictFileName — File name of target data dictionary or dictionaries
character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use
the file extension sldd.
Example: 'myDict.sldd'
Data Types: char

unsavedAction — Action for unsaved changes
'-discard' | '-save'

Action for unsaved changes, specified as '-discard' (to discard changes) or '-save'
(to save changes).

**Tips**

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the hide method of a Simulink.data.Dictionary object.
- You created an object of any of these classes that refer to the dictionary:
  - Simulink.data.Dictionary
  - Simulink.data.dictionary.Section
  - Simulink.data.dictionary.Entry
To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

**Topics**

“Store Data in Dictionary Programmatically”

**Introduced in R2016a**
**Simulink.data.dictionary.create**

Create new data dictionary and create Simulink.data.Dictionary object

**Syntax**

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

**Description**

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a Simulink.data.Dictionary object representing the new data dictionary.

**Examples**

**Create New Data Dictionary and Data Dictionary Object**

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a Simulink.data.Dictionary object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj =
    Dictionary with properties:
        DataSources: {0x1 cell}
        HasAccessToBaseWorkspace: 0
        EnableAccessToBaseWorkspace: 0
```
Input Arguments

dictionaryFile — Name of new data dictionary
character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, Simulink.data.dictionary.create creates the new data dictionary file in your working MATLAB folder. Simulink.data.dictionary.create also supports file paths specified relative to your working folder.

Example: 'myDictionary.sldd'
Example: 'C:\Users\jsmith\myDictionary.sldd'
Example: '..\myOtherDictionary.sldd'
Data Types: char

Output Arguments

dictionaryObj — Newly created data dictionary
Simulink.data.Dictionary object

Newly created data dictionary, returned as a Simulink.data.Dictionary object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

Simulink.data.Dictionary | Simulink.data.dictionary.open
Topics
“Store Data in Dictionary Programmatically”
“What Is a Data Dictionary?”

Introduced in R2015a
Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

openDDs = Simulink.data.dictionary.getOpenDictionaryPaths
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)

Description

openDDs = Simulink.data.dictionary.getOpenDictionaryPaths returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as Simulink.data.Dictionary, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command Simulink.data.dictionary.cleanupWorkerCache.

openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName) returns the file paths of data dictionaries that have the file name dictFileName. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

Examples

2-677
Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```matlab
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```matlab
show(dictObj)
```

Identify all of the dictionaries that are open.

```matlab
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```matlab
hide(dictObj)
```

The dictionary no longer appears as a node in the `Model Hierarchy` pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```matlab
close(dictObj)
clear dictObj
```

Input Arguments

dictFileName — File name of target data dictionary or dictionaries
character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`. 
Example: 'myDict.sldd'
Data Types: char

Output Arguments

openDDs — File names and paths of open data dictionaries
cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the Model Hierarchy pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select Close. Alternatively, use the hide method of a Simulink.data.Dictionary object.
- You created an object of any of these classes that refer to the dictionary:
  - Simulink.data.Dictionary
  - Simulink.data.dictionary.Section
  - Simulink.data.dictionary.Entry

To close these connections to the dictionary, use the close method of the Simulink.data.Dictionary object or clear the object. Clear the Simulink.data.dictionary.Section and Simulink.data.dictionary.Entry objects.
- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)

Description

dictionaryObj = Simulink.data.dictionary.open(dictionaryFile) opens the specified data dictionary and returns a Simulink.data.Dictionary object representing an existing data dictionary identified by its file name and, optionally, file path with dictionaryFile.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary myDictionary_ex_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')

myDictionaryObj =

    Dictionary with properties:
        DataSources: {'myRefDictionary_ex_API.sldd'}
Input Arguments

dictionaryFile — Target data dictionary
character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, Simulink.data.dictionary.open searches the MATLAB path for the specified file. Simulink.data.dictionary.open also supports paths specified relative to the MATLAB working folder.

Example: 'myDictionary_ex_API.sldd'
Example: 'C:\Users\jsmith\myDictionary_ex_API.sldd'
Example: '..\myOtherDictionary.sldd'
Data Types: char

Topics
“Store Data in Dictionary Programmatically”

Introduced in R2015a
Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

Syntax

Simulink.data.dictionary.setupWorkerCache

Description

Simulink.data.dictionary.setupWorkerCache prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a spmd block, prior to starting a parfor block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. Simulink.data.dictionary.setupWorkerCache temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a parfor block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a Simulink.Parameter object whose value influences the variant condition of a Simulink.Variant object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use Simulink.SimulationInput objects instead of the
programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary % so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
dictObj = Simulink.data.dictionary.open(dd);
sectObj = getSection(dictObj,'Design Data');
entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
temp = getValue(entryObj);
temp.Value = CtrlValues(index);
setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and % close the dictionary when finished with an iteration of the parfor-loop
discardChanges(dictObj);
close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end

Note If data dictionaries are open, you cannot use the command
Simulink.data.dictionary.cleanupWorkerCache. To identify open data
dictionaries, use Simulink.data.dictionary.getOpenDictionaryPaths.

Introduced in R2015a
Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

Syntax

returnValue = Simulink.data.evalinGlobal(modelName,expression)

Description

returnValue = Simulink.data.evalinGlobal(modelName,expression) evaluates the MATLAB expression expression in the context of the Simulink model modelName and returns the values returned by expression. evalinGlobal evaluates expression in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression myNewVariable = 237; in the context of the model vdp, which is not linked to any data dictionary. myNewVariable appears as a variable in the MATLAB base workspace.

Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')

Evaluate the MATLAB expression myNewEntry = true; in the context of the model sldemo_fuelsys_dd_controller, which is linked to the data dictionary sldemo_fuelsys_dd_controller.sldd. myNewEntry appears as an entry in the Design Data section of the dictionary.

Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',... 'myNewEntry = true;')
Confirm the creation of the entry `myNewEntry` in the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```matlab
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

### Input Arguments

- **modelName** — Name of target Simulink model  
  character vector  
  Name of target Simulink model, specified as a character vector.  
  Example: `'myTestModel'`  
  Data Types: `char`

- **expression** — MATLAB expression to evaluate  
  character vector  
  MATLAB expression to evaluate, specified as a character vector.  
  Example: `'a = 5.3'`  
  Example: `'whos'`  
  Example: `'CurrentSpeed.Value = 290.73'`  
  Data Types: `char`

### Output Arguments

- **returnValue** — Value returned by specified expression  
  valid entry or variable value  
  Value returned by the specified MATLAB expression.
**Tips**

- `evalinGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

**See Also**

`Simulink.data.assigninGlobal` | `Simulink.data.existsInGlobal` | `evalin`

**Topics**

“Store Data in Dictionary Programmatically”

**Introduced in R2015a**
Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

Syntax

varExists = Simulink.data.existsInGlobal(modelName,varName)

Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

Simulink.data.existsInGlobal('vdp','PressVect')

ans =

0

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. 
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')
ans =
    1

Because sldemo_fuelsys_dd_controller.slx is linked to the data dictionary
sldemo_fuelsys_dd_controller.sldd, existsInGlobal searches for PressVect
only in the Design Data section of the dictionary.

Input Arguments

modelName — Name of target Simulink model
character vector

Name of target Simulink model, specified as a character vector.
Example: 'myTestModel'
Data Types: char

varName — Name of target variable or data dictionary entry
character vector

Name of target variable or data dictionary entry, specified as a character vector.
Example: 'myTargetVariable'
Data Types: char

Output Arguments

varExists — Indication of existence of target variable or data dictionary entry
1|0

Indication of existence of target variable or data dictionary entry, returned as 1 to
indicate existence or 0 to indicate absence.
Tips

- `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a
Simulink.data.getEnumTypeInfo

Get information about enumerated data type

Syntax

information = Simulink.data.getEnumTypeInfo(enumTypeName, infoRequest)

Description

information = Simulink.data.getEnumTypeInfo(enumTypeName, infoRequest) returns information about an enumerated data type enumTypeName.

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see “Customize Simulink Enumeration”.

Examples

Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type LEDcolor. Suppose LEDcolor defines two enumeration members, GREEN and RED, and uses GREEN as the default member.

Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')

ans =

GREEN
Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type LEDcolor, find out if generated code exports or imports the definition of the type to or from a header file.

```matlab
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

ans =
Auto

ans =

Because DataScope is 'Auto' and HeaderFile is empty, generated code defines the enumerated data type LEDcolor in the header file `model_types.h` where `model` is the name of the model used to generate code.

### Input Arguments

- **enumTypeName** — Name of target enumerated data type
default: character vector

Name of the target enumerated data type, specified as a character vector.

Example: 'myFirstEnumType'

Data Types: char

- **infoRequest** — Information to return
default: valid character vector

Information to return, specified as one of the character vector options in the table.

<table>
<thead>
<tr>
<th>Specified value</th>
<th>Information returned</th>
<th>Example return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'DefaultValue'</td>
<td>The default enumeration member, returned as an instance of the enumerated data type.</td>
<td>enumMember1</td>
</tr>
<tr>
<td>Specified value</td>
<td>Information returned</td>
<td>Example return value</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>'Description'</td>
<td>The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.</td>
<td>'My first enum type.'</td>
</tr>
<tr>
<td>'HeaderFile'</td>
<td>The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.</td>
<td>'myEnumType.h'</td>
</tr>
<tr>
<td>'DataScope'</td>
<td>Indication whether generated code imports or exports the definition of the data type. A return value of 'Auto' indicates generated code defines the type in the header file model_types.h or imports the definition from the header file identified by HeaderFile. A return value of 'Exported' or 'Imported' indicates generated code exports or imports the definition to or from the header file identified by HeaderFile.</td>
<td>'Exported'</td>
</tr>
<tr>
<td>'StorageType'</td>
<td>The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns 'int' if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.</td>
<td>'int32'</td>
</tr>
<tr>
<td>'AddClassNameToEnumNames'</td>
<td>Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as true or false.</td>
<td>true</td>
</tr>
</tbody>
</table>

Introduced in R2014b
Simulink.data.isSupportedEnumClass

Determine whether an enumeration class is valid for Simulink

Syntax

valid = Simulink.data.isSupportedEnumClass(enumClass)

Description

valid = Simulink.data.isSupportedEnumClass(enumClass) returns true if enumClass is a valid enumeration class for Simulink.

Examples

Determine if Enumeration Class is Valid

Define an enumeration class of basic colors, then confirm that it is valid.

Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2]);
Simulink.data.isSupportedEnumClass('BasicColors')

ans =

    logical

    1

Perform the same validity check by using the meta.class object as the input.

Simulink.data.isSupportedEnumClass(?BasicColors)

ans =

2-696
logical
1

Check if `Simulink.NumericType` is a valid enumeration class by using the `meta.class` object as the input.

```matlab
Simulink.data.isSupportedEnumClass('Simulink.NumericType')
```

```
ans =
      logical
       0
```

**Input Arguments**

`enumClass` — Enumeration class
character vector | `meta.class`

Enumeration class, specified as a character vector or as `meta.class` object.

Example: `'myEnumClass'` or `?myEnumClass`

**Output Arguments**

`valid` — Whether enumeration class is valid
logical

If the input value refers to a valid enumeration class for Simulink, `valid` is `true`, otherwise `valid` is `false`.

“Simulink Enumerations”

Introduced in R2014b
Simulink.data.isSupportedEnumObject

Determine whether an enumeration object is valid for Simulink

**Syntax**

```matlab
valid = Simulink.data.isSupportedEnumObject(enumObject)
```

**Description**

```matlab
valid = Simulink.data.isSupportedEnumObject(enumObject)
```
returns true if `enumObject` is a valid enumeration object for Simulink.

**Examples**

**Determine if Enumeration Object is Valid**

Define an enumeration class of basic colors.

```matlab
Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2]);
```

Confirm that an instance of the enumeration class is valid.

```matlab
Simulink.data.isSupportedEnumObject(BasicColors.Yellow)
ans =
    logical
    1
```

Call the function with input that is not an enumeration object.

```matlab
Simulink.data.isSupportedEnumObject(5)
```
ans =
    logical
           0

**Input Arguments**

enumObject — Enumeration object

Instance of a defined enumeration, specified as an enumeration object.
Example: `myEnumObject`

**Output Arguments**

valid — Whether enumeration class is valid

logical

If the input value refers to a valid enumeration object for Simulink, `valid` is `true`, otherwise `valid` is `false`.

**Topics**

“Simulink Enumerations”

**Introduced in R2014b**
Simulink.defineIntEnumType

Define enumerated data type

Syntax

Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'Description', ClassDesc)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'DefaultValue', DefValue)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'DataScope', ScopeSelection)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'HeaderFile', FileName)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'AddClassNameToEnumNames', Flag)
Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'StorageType', DataType)

Description

Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues) defines an enumeration named ClassName with enumeration values specified with CellOf Enums and underlying numeric values specified by IntValues.

Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'Description', ClassDesc) defines the enumeration with a description (character vector).

Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'DefaultValue', DefValue) defines a default value for the enumeration, which is one of the character vectors you specify for CellOf Enums.

Simulink.defineIntEnumType(ClassName, CellOf Enums, IntValues, 'DataScope', ScopeSelection) specifies whether the data type definition should be imported from, or exported to, a header file during code generation.
Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues, 'HeaderFile', FileName) specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues, 'AddClassNameToEnumNames', Flag) specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for CellOfEnums. For Flag, specify true or false. For example, if you specify true, the code generator would use BasicColors.Red instead of Red to represent an enumerated value.

Simulink.defineIntEnumType(ClassName, CellOfEnums, IntValues, 'StorageType', DataType) specifies the data type used to store the enumerations’ underlying integer values in code generated from a model.

**Input Arguments**

**ClassName**

The name of the enumerated data type.

**CellOfEnums**

A cell array of character vectors that defines the enumerations for the data type.

**IntValues**

An array of numeric values that correspond to enumerations of the data type.

'**Description**, ClassDesc'

Specifies a character vector that describes the enumeration data type.

'**DefaultValue**, DefValue'

Specifies the default enumeration value.

'**HeaderFile**, FileName'

Specifies a character vector naming the header file that is to contain the data type definition.
By default, the generated `#include` directive uses the preprocessor delimiter " instead of `< and >. To generate the directive `#include <myTypes.h>`, specify `FileName` as `'<myTypes.h>'`.

`'DataScope'`, `'Auto' | 'Exported' | 'Imported'`

Specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

<table>
<thead>
<tr>
<th>Value</th>
<th>Action</th>
</tr>
</thead>
</table>
| Auto (default) | If no value is specified for `Headerfile`, export the type definition to `model_types.h`, where `model` is the model name.  
If a value is specified for `Headerfile`, import the data type definition from the specified header file. |
| Exported          | Export the data type definition to a header file.  
If no value is specified for `Headerfile`, the header file name defaults to `type.h`, where `type` is the data type name. |
| Imported          | Import the data type definition from a header file.  
If no value is specified for `Headerfile`, the header file name defaults to `type.h`, where `type` is the data type name. |

`'AddClassNameToEnumNames'`, `Flag`

A logical flag that specifies whether code generator applies the class name as a prefix to the enumerations.

`'StorageType'`, `DataType`

Specifies a character vector that identifies the data type used to store the enumerations’ underlying integer values in generated code. The following data types are supported: `'int8'`, `'int16'`, `'int32'`, `'uint8'`, or `'uint16'`. 
Examples

Assume an external data dictionary includes the following enumeration:

BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)

Import the enumeration class definition into the MATLAB workspace while specifying int16 as the underlying integer data type for generated code:

```matlab
Simulink.defineIntEnumType('BasicColors', ...
    {'Red', 'Yellow', 'Blue'}, ...
    [0;1;2], ...
    'Description', 'Basic colors', ...
    'DefaultValue', 'Blue', ...
    'HeaderFile', 'mybasiccolors.h', ...
    'DataScope', 'Exported', ...
    'AddClassNameToEnumNames', true, ...
    'StorageType', 'int16');
```

Introduced in R2010b
Simulink.defaultModelTemplate

Set or get default model template

Syntax

Simulink.defaultModelTemplate(templatename)

templatepath = Simulink.defaultModelTemplate

Description

Simulink.defaultModelTemplate(templatename) sets the template file specified by templatename as the default model template to use for new models. This setting is persistent between Simulink sessions.

templatepath = Simulink.defaultModelTemplate gets the full path to the current default model template.

Examples

Set the default model template

Simulink.defaultModelTemplate('simple_simulation.sltx')

Get the default model template

mydefaulttemplate = Simulink.defaultModelTemplate

Clear and restore the default model template

Use set_param to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.
set_param(0,'StopTime','99');

Restore the default template.

Simulink.defaultModelTemplate('$restore');

**Input Arguments**

*templatename* — Template file name
character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and *slt* extension.

Example: \Home\username\Documents\MATLAB\template.sltx

Data Types: char

**Output Arguments**

*templatepath* — Template path
character vector

Template path, specified as a character vector, showing the full path to the current default model template.

**See Also**

Simulink.createFromTemplate | Simulink.exportToTemplate | Simulink.findTemplates | new_system

**Topics**

“Create and Open Models”
“Create a Template from a Model”
“Using Templates to Create Standard Project Settings”

**Introduced in R2016b**
Simulink.exportToTemplate

Create template from model or project

Syntax

templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value)

Description

templatefile = Simulink.exportToTemplate(obj,templatename) creates a template file (templatename.sltx) from a model or project specified by obj.

If you have project templates created in R2014a or earlier (.zip files), use Simulink.exportToTemplate to upgrade them to .sltx files, then you can use them in the start page.

templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value) specifies additional template options as one or more Name, Value pair arguments.

Examples

Create a Template From a Model

Open the vdp model and create a template from it.

vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
Create a Template From a Model and Specify Description

Open the *vdp* model and create a template from it, specifying a description.

```matlab
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate','Description','Use this template to create a vdp model')
```

**Input Arguments**

- **obj** — Model, library, or project
  
  Character vector | numeric handle | `slproject.ProjectManager`
  
  Model, library, or project, specified by name or numeric handle, or a `slproject.ProjectManager` object returned by the `simulinkproject` function.
  
  **Data Types:** double | char

- **templatename** — Template file name
  
  Character vector
  
  Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and *.*sltx extension.
  
  **Data Types:** char

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `Title, 'My Project Template'`

- **Group** — Group of template
  
  Character vector
  
  Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.
  
  Example: `'Simscape'`
  
  **Data Types:** char
**Author — Author of template**
character vector

Author of template, specified as a character vector.
Data Types: char

**Description — Description of template**
character vector

Description of template, specified as a character vector.
Data Types: char

**ThumbnailFile — Thumbnail image file name**
character vector

Thumbnail image file name, specified as a character vector.
Data Types: char

**Title — Title of model or project template**
character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: 'My Project Template'
Data Types: char

**Output Arguments**

**templatefile — Template file**
character vector

Template file, returned as `templatename.sltx` file.

**See Also**

`Simulink.createFromTemplate` | `Simulink.defaultModelTemplate` | `Simulink.findTemplates`

Introduced in R2016a
Simulink.exportToVersion

Export model or library for use in previous version of Simulink

Syntax

exported_file = Simulink.exportToVersion(modelname,target_filename,version)
exported_file = Simulink.exportToVersion(modelname,target_filename,version,Name,Value)

Description

exported_file = Simulink.exportToVersion(modelname,target_filename,version) exports the model or library modelname to a file named target_filename in a format that the specified previous Simulink version can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The save_system ExportToVersion option is a legacy option for this functionality that is also supported.

exported_file = Simulink.exportToVersion(modelname,target_filename,version,Name,Value) specifies additional options as one or more Name, Value pair arguments.

Examples

Export a Model to a Previous Version

Get the current top-level system and export it.
Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b');

Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

Simulink.exportToVersion(bdroot,'mymodel.slx','R2014b','BreakUserLinks',true);

Input Arguments

**modelname** — Model to export
character vector

Model to export, specified as a character vector, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: char

**target_filename** — Exported file name
character vector

Exported file name, specified as a character vector. The target file must not be the same as the model file.

Example: 'mymodel.slx'

Data Types: char

**version** — MATLAB release name

'R2013B' | 'R2014A_MDL' | 'R2016B_SLX' | ...

MATLAB release name, specified as a character vector, which specifies a previous Simulink version. Simulink.exportToVersion exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

You can specify model file format as SLX or MDL using the suffix _MDL or _SLX. If you do not specify a format, you export your default model file format.
If you use the Export to Previous Version dialog box instead of Simulink.exportToVersion, then the **Save as type** list supports 7 years of previous releases.

Example: 'R2015B'

Data Types: char

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of **Name, Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1, Value1, ..., NameN, ValueN**.

Example:

**AllowPrompt — Allow prompt or message dialog box**

false (default) | true | 'on' | 'off'

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to **true**. or **on**.

**BreakUserLinks — Break user-defined links**

false (default) | true | 'on' | 'off'

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

**BreakToolboxLinks — Break all toolbox links**

false (default) | true | 'on' | 'off'

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The 'BreakToolboxLinks' option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

**Note** The 'BreakToolboxLinks' option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:
• Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
• Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
• Any broken links prevent the automatic library forwarding mechanism from upgrading the link.

If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

Output Arguments

exported_file — Exported file
character vector

Exported file, returned in the format that the specified previous Simulink version can load.

See Also

save_system

Topics

“Save a Model”

Introduced in R2016a
Simulink.fileGenControl

Specify root folders for files generated by diagram updates and model builds

Syntax

cfg = Simulink.fileGenControl('getConfig')
Simulink.fileGenControl(Action,Name,Value)

Description

cfg = Simulink.fileGenControl('getConfig') returns a handle to an instance of the Simulink.FileGenConfig object, which contains the current values of these file generation control parameters:

- CacheFolder - Specifies the root folder for model build artifacts that are used for simulation, including Simulink® cache files.
- CodeGenFolder - Specifies the root folder for code generation files.
- CodeGenFolderStructure - Controls the folder structure within the code generation folder.

To get or set the parameter values, use the Simulink.FileGenConfig object.

These Simulink preferences determine the initial parameter values for the MATLAB session:

- Simulation cache folder - CacheFolder
- Code generation folder - CodeGenFolder
- Code generation folder structure - CodeGenFolderStructure

Simulink.fileGenControl(Action,Name,Value) performs an action that uses the file generation control parameters of the current MATLAB session. Specify additional options with one or more name, value pair arguments.
Examples

Get File Generation Control Parameter Values

To obtain the file generation control parameter values for the current MATLAB session, use getConfig.

cfg = Simulink.fileGenControl('getConfig');

myCacheFolder = cfg.CacheFolder;
myCodeGenFolder = cfg.CodeGenFolder;
myCodeGenFolderStructure = cfg.CodeGenFolderStructure;

Set File Generation Control Parameters by Using Simulink.FileGenConfig Object

To set the file generation control parameter values for the current MATLAB session, use the setConfig action. First, set values in an instance of the Simulink.FileGenConfig object. Then, pass the object instance. This example assumes that your system has aNonDefaultCacheFolder and aNonDefaultCodeGenFolder folders.

% Get the current configuration
cfg = Simulink.fileGenControl('getConfig');

% Change the parameters to non-default locations
% for the cache and code generation folders
cfg.CacheFolder = fullfile('C:','aNonDefaultCacheFolder');
cfg.CodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');
cfg.CodeGenFolderStructure = 'TargetEnvironmentSubfolder';

Simulink.fileGenControl('setConfig', 'config', cfg);

Set File Generation Control Parameters Directly

You can set file generation control parameter values for the current MATLAB session without creating an instance of the Simulink.FileGenConfig object. This example assumes that your system has aNonDefaultCacheFolder and aNonDefaultCodeGenFolder folders.
myCacheFolder = fullfile('C:','aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...
    'CodeGenFolder', myCodeGenFolder, ...
    'CodeGenFolderStructure', ...
    Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);

If you do not want to generate code for different target environments in separate folders,
for 'CodeGenFolderStructure', specify the value

**Reset File Generation Control Parameters**

You can reset the file generation control parameters to values from Simulink preferences.

Simulink.fileGenControl('reset');

**Create Simulation Cache and Code Generation Folders**

To create file generation folders, use the set action with the 'createDir' option. You can keep previous file generation folders on the MATLAB path through the 'keepPreviousPath' option.

% 
myCacheFolder = fullfile('C:','aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:','aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', ...
    'CacheFolder',myCacheFolder, ...
    'CodeGenFolder',myCodeGenFolder, ...
    'keepPreviousPath',true, ...
    'createDir',true);

**Input Arguments**

**Action — Specify action**

'reset' | 'set' | 'setConfig'
Specify an action that uses the file generation control parameters of the current MATLAB session:

- 'reset' – Reset file generation control parameters to values from Simulink preferences.
- 'set' – Set file generation control parameters for the current MATLAB session by directly passing values.
- 'setConfig' – Set file generation control parameters for the current MATLAB session by using an instance of a Simulink.FileGenConfig object.

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name,Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: `Simulink.fileGenControl('Action', 'Name', 'Value');`

**config** — Specify instance of Simulink.FileGenConfig object handle

Specify the Simulink.FileGenConfig object instance containing file generation control parameters that you want to set.

Option for setConfig.

Example: `Simulink.fileGenControl('setConfig', 'config', cfg);`

**CacheFolder** — Specify simulation cache folder character vector

Specify a simulation cache folder path value for the CacheFolder parameter.

Option for set.

Example: `Simulink.fileGenControl('set', 'CacheFolder', 'myCacheFolder');`

**CodeGenFolder** — Specify code generation folder character vector

Specify a code generation folder path value for the CodeGenFolder parameter. You can specify an absolute path or a path relative to build folders. For example:
• 'C:\Work\mymodelsimcache' and '/mywork/mymodelgencode' specify absolute paths.
• 'mymodelsimcache' is a path relative to the current working folder (pwd). The software converts a relative path to a fully qualified path at the time the CacheFolder or CodeGenFolder parameter is set. For example, if pwd is '/mywork', the result is '/mywork/mymodelsimcache'.
• '../test/mymodelgencode' is a path relative to pwd. If pwd is '/mywork', the result is '/test/mymodelgencode'.

Option for set.
Example: Simulink.fileGenControl('set', 'CodeGenFolder', myCodeGenFolder);

CodeGenFolderStructure — Specify generated code folder structure

Specify the layout of subfolders within the generated code folder:
• Simulink.filegen.CodeGenFolderStructure.ModelSpecific (default) – Place generated code in subfolders within a model-specific folder.
• Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder – If models are configured for different target environments, place generated code for each model in a separate subfolder. The name of the subfolder corresponds to the target environment.

Option for set.
Example: Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ... 'CodeGenFolder', myCodeGenFolder, ... 'CodeGenFolderStructure', ... Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);

keepPreviousPath — Keep previous folder paths on MATLAB path
false (default) | true

Specify whether to keep the previous values of CacheFolder and CodeGenFolder on the MATLAB path:
• true – Keep previous folder path values on MATLAB path.
false (default) - Remove previous older path values from MATLAB path.

Option for reset, set, or setConfig.

Example: Simulink.fileGenControl('reset', 'keepPreviousPath', true);

createDir — Create folders for file generation

false (default) | true

Specify whether to create folders for file generation if the folders do not exist:

• true – Create folders for file generation.
• false (default) – Do not create folders for file generation.

Option for set or setConfig.

Example: Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, 'CodeGenFolder', myCodeGenFolder, 'keepPreviousPath', true, 'createDir',true);

Avoid Naming Conflicts

Using Simulink.fileGenControl to set CacheFolder and CodeGenFolder adds the specified folders to your MATLAB search path. This function has the same potential for introducing a naming conflict as using addpath to add folders to the search path. For example, a naming conflict occurs if the folder that you specify for CacheFolder or CodeGenFolder contains a model file with the same name as an open model. For more information, see “What Is the MATLAB Search Path?” (MATLAB) and “Files and Folders that MATLAB Accesses” (MATLAB).

To use a nondefault location for the simulation cache folder or code generation folder:

1. Delete any potentially conflicting artifacts that exist in:

   • The current working folder, pwd.
   • The nondefault simulation cache and code generation folders that you intend to use.

2. Specify the nondefault locations for the simulation cache and code generation folders by using Simulink.fileGenControl or Simulink preferences.
Output Arguments

cfg — Current values of file generation control parameters
object handle

Instance of a Simulink.FileGenConfig object, which contains the current values of file generation control parameters.

Introduced in R2010b
Simulink.findBlocks

Find blocks in Simulink models

Syntax

\[
\begin{align*}
bl &= \text{Simulink.findBlocks}(sys) \\
bl &= \text{Simulink.findBlocks}(sys, \text{options}) \\
bl &= \text{Simulink.findBlocks}(sys, \text{Param1, Value1,}, ..., \text{ParamN, ValueN}) \\
bl &= \text{Simulink.findBlocks}(sys, \text{Param1, Value1,}, ..., \text{ParamN, ValueN, options})
\end{align*}
\]

Description

\[
\begin{align*}
\text{bl} &= \text{Simulink.findBlocks}(sys) \text{ returns handles to all blocks in the model or subsystem } sys. \\
\text{bl} &= \text{Simulink.findBlocks}(sys, \text{options}) \text{ finds blocks that match the criteria specified by a } \text{Simulink.FindOptions} \text{ object.} \\
\text{bl} &= \text{Simulink.findBlocks}(sys, \text{Param1, Value1,}, ..., \text{ParamN, ValueN}) \text{ finds blocks whose block parameters have the specified values.} \\
\text{bl} &= \text{Simulink.findBlocks}(sys, \text{Param1, Value1,}, ..., \text{ParamN, ValueN, options}) \text{ finds blocks whose parameters have the specified values and that match the criteria specified by a } \text{FindOptions} \text{ object.}
\end{align*}
\]

Examples

Find Blocks in a Model

Return handles for all blocks in the model vdp.

```
load_system(vdp);
bl = Simulink.findBlocks('vdp')
```
Return block names.

```matlab
bl = getfullscreen(Simulink.findBlocks('vdp'))
```

```matlab
bl =

12×1 cell array

{vdp/Fcn}  
{vdp/More Info}  
{vdp/More Info/Model Info}  
{vdp/Mu}  
{vdp/Mux}  
{vdp/Product}  
{vdp/Scope}  
{vdp/Sum}  
{vdp/x1}  
{vdp/x2}  
{vdp/Out1}  
{vdp/Out2}

Return block handles for the block whose name is `Mu`.

```matlab
Simulink.findBlocks('vdp','Name','Mu')
```
ans = 8.0001

**Input Arguments**

*sys* — Model or subsystem to find blocks in character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array. Example: 'vdp' "f14/Aircraft Dynamics Model"

*options* — Search constraints

Simulink.FindOptions object

Search constraints, specified as a Simulink.FindOptions object.

**Output Arguments**

*bl* — Search results

array of handles

Search results, returned as an array of handles.

**See Also**

Simulink.FindOptions | Simulink.allBlockDiagrams | Simulink.findBlocksOfType

**Topics**

“Model Parameters” on page 6-2
“Block-Specific Parameters” on page 6-132

**Introduced in R2018a**
Simulink.findBlocksOfType

Find specified type of block in Simulink models

Syntax

bl = Simulink.findBlocksOfType(sys,type)
bl = Simulink.findBlocksOfType(sys,type,options)
bl = Simulink.findBlocksOfType(sys,
    type,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocksOfType(sys,
    type,Param1,Value1,...,ParamN,ValueN,options)

Description

bl = Simulink.findBlocksOfType(sys,type) returns handles to all blocks of the
specified type in the model or subsystem sys.

bl = Simulink.findBlocksOfType(sys,type,options) matches the criteria
specified by a FindOptions object.

bl = Simulink.findBlocksOfType(sys,
    type,Param1,Value1,...,ParamN,ValueN) finds blocks whose parameters have the
specified values.

bl = Simulink.findBlocksOfType(sys,
    type,Param1,Value1,...,ParamN,ValueN,options) finds blocks whose
parameters have the specified values and that match the criteria specified by a
FindOptions object.

Examples

Find Blocks of a Type in Model

Find all blocks of type Gain in the model vdp.
load_system('vdp');
Simulink.findBlocksOfType('vdp','Gain')

ans =
     7.0001

To return block names instead of handles, use getfullname.
getfullname(Simulink.findBlocksOfType('vdp','Gain'))

ans =
     'vdp/Mu'

Find Blocks of a Type Using Search Options

Load the model sldemo_clutch. Then, create a FindOptions object and use it to constrain the search of GoTo blocks in the model to the Unlocked system.

load_system('sldemo_clutch');
f = Simulink.FindOptions('SearchDepth',1);
bl = Simulink.findBlocksOfType('sldemo_clutch/Unlocked','Goto',f)

bl =
     166.0001
     167.0001

Input Arguments

sys — Model or subsystem to find blocks in
    character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.
Example: 'vdp' "f14/Aircraft Dynamics Model"

type — Block type
    character vector | string array
Block type, specified as a character vector or string array. Use `get_param` with the 'BlockType' parameter to get the block type.

**options — Search constraints**
simulink.FindOptions object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `Simulink.FindOptions('SearchDepth',1)

### Output Arguments

**bl — Search results**
array of handles

Search results, returned as an array of handles.

### See Also

**Introduced in R2018a**
Simulink.findIntEnumType

Find enumeration classes defined by Simulink.defineIntEnumType

Syntax

result = Simulink.findIntEnumType(typeName)
result = Simulink.findIntEnumType()

Description

result = Simulink.findIntEnumType(typeName) returns the meta.class object for class type that is defined by Simulink.defineIntEnumType. Use the returned meta.class object to query attributes of the enumeration class. If the class does not exist, the function returns an empty meta.class object.

result = Simulink.findIntEnumType() returns meta.class objects for all enumeration classes that are defined by Simulink.defineIntEnumType. Use the returned meta.class objects to query attributes of the enumeration classes.

Examples

Find a Specific Dynamic Enumerated Data Type

Define an enumeration type.

Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);

Check for the enumeration type that you have created.

myResult = Simulink.findIntEnumType('myEnumType')

myResult =

class with properties:
Find All Dynamic Enumerated Data Types

Define two enumeration types.

```matlab
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
```

Check for the enumeration types that you have created.

```matlab
myResult = Simulink.findIntEnumType()
```

### Input Arguments

- **typeName** — Name of enumeration class
  
  character vector or string
  
  Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.
  
  Example: 'myEnumType'
  
  **Data Types:** char | string
Output Arguments

result — Search results
array of meta.class objects

Search result, returned as an array of meta.class objects. If there are no enumeration classes, the array is empty.

See Also

enumeration | Simulink.clearIntEnumType | Simulink.defineIntEnumType

Introduced in R2018b
Simulink.findTemplates

Find model or project templates with specified properties

Syntax

filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)

Description

filename = Simulink.findTemplates(templatename) returns the names and TemplateInfo objects for all matching templates that include templatename.

filename = Simulink.findTemplates(templatename,Name,Value) also specifies additional template properties as one or more Name, Value pair arguments.

[filename,info] = Simulink.findTemplates(templatename) returns the names and TemplateInfo objects for all matching templates.

Examples

Find a Particular Template

Get the full path to the default model template.

filename = Simulink.findTemplates('factory_default_model');

Find All Templates With Specified Folders or Authors

Get all templates inside folders called work.

filename = Simulink.findTemplates('work/')
Get all templates for which the Author property includes the character vector Smith.

```matlab
filename = Simulink.findTemplates('*','Author','Smith')
```

### Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and `sltemplate.TemplateInfo` objects for each of them.

```matlab
[filename,info] = Simulink.findTemplates('dsp*','Type','Model');
```

### Input Arguments

**templatename** — Template name

Character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character “*”.

Example:

```
Data Types: char
```

### Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name, Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1, Value1,...,NameN, ValueN**.

You can specify regular expressions for any of the Value character vectors, e.g., including the wildcard asterisk character “*”.

Example: 'Author','*son'

**Type** — Model, library, or project

A character vector.

Model, library, or project template type, specified as a character vector for model, library, or project.
Example: 'Simscape'
Data Types: char

**Title — Title of template**
character vector

Title of template, specified as a character vector.
Example: 'Simscape'
Data Types: char

**Group — Group of template**
character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.
Example: 'Simscape'
Data Types: char

**Author — Author of template**
character vector

Author of template, specified as a character vector.
Data Types: char

**Description — Description of template**
character vector

Description of template, specified as a character vector.
Data Types: char

**Output Arguments**

**filename — Template name**
character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.
info — Template information

template info objects | array of template info objects

Template information of matching templates, returned as sltemplate.TemplateInfo objects.

See Also
Simulink.createFromTemplate | Simulink.exportToTemplate

Topics

“Create a Template from a Model”
“Using Templates to Create Standard Project Settings”

Introduced in R2016a
Simulink.findVars

Analyze relationship between variables and blocks in models

Syntax

[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars(___ ,Name,Value)

Description

[variables] = Simulink.findVars(context) finds and returns variables that are used in the blocks and models specified by context, including subsystems and referenced models. The function returns an empty vector if context does not use any variables.

[variables] = Simulink.findVars(context,variablefilter) finds only the variables or enumerated types that are specified by variablefilter. For example, use this syntax to determine where a variable is used in a model.

[variables] = Simulink.findVars(___ ,Name,Value) finds variables with additional options specified by one or more Name,Value pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in context, in addition to variables.

Examples

Variables in Use in a Model

Find variables used by MyModel.

variables = Simulink.findVars('MyModel');
**Specific Variable in Use in a Model**

Find all uses of the base workspace variable k by MyModel. Use the cached results to avoid compiling MyModel.

```matlab
variables = Simulink.findVars('MyModel','Name','k',
    'SearchMethod','cached','SourceType','base workspace');
```

**Regular Expression Matching**

Find all uses of a variable whose name matches the regular expression ^trans.

```matlab
variables = Simulink.findVars('MyModel','Regexp','on',
    'Name','^trans');
```

**Variables Common to Two Models**

Given two models, find the variables used by the first model, the second, and both

```matlab
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1Vars,model2Vars);
```

**Variables Not Used in a Model**

Find the variables that are defined in the model workspace of MyModel but that are not used by the model.

```matlab
unusedVars = Simulink.findVars('MyModel','FindUsedVars','off',
    'SourceType','model workspace');
```

**Specific Variable Not Used in a Model**

Determine if the base workspace variable k is not used by MyModel.
varObj = Simulink.VariableUsage('k','base workspace');
unusedVar = Simulink.findVars('MyModel',varObj,
'FindUsedVars','off');

**Variables Used by a Block**

Find the variables that are used by the block Gain1 in MyModel.

variables = Simulink.findVars('MyModel',
'Users','MyModel/Gain1');

**Variables Used in a Model Reference Hierarchy**

Find the variables that are used in a model reference hierarchy. Begin the search with the model MyNestedModel, and search the entire hierarchy below MyNestedModel.

variables = Simulink.findVars('MyNestedModel','SearchReferencedModels','on');

**Variables and Enumerated Types Used in a Model**

Find variables and enumerated types that are used in MyModel.

varsAndEnumTypes = Simulink.findVars('MyModel','IncludeEnumTypes','on');

**Input Arguments**

context — Models and blocks to search
character vector | string | cell array of character vectors | string array

Models and blocks to search, specified as a character vector, string, cell array of character vectors, or a string array. You can specify context in one of the following ways:

- The name of a model. For example, ('vdp') specifies the model vdp.slx.
- The name or path of a block or masked block. For example, ('vdp/Gain1') specifies a block named Gain1 at the root level of the model vdp.slx.
• A cell array of model or block names.

Data Types: char | cell

**variablefilter** — Specific variables to find

Array of Simulink.VariableUsage objects

Specific variables to find, specified as an array of Simulink.VariableUsage objects. Each Simulink.VariableUsage object identifies a variable to find.

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1,...,NameN, ValueN.

Example: 'FindUsedVars','off'

**FindUsedVars** — Find variables that are used or not used

'on' (default) | 'off'

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of 'FindUsedVars' and 'on' or 'off'. If you specify 'FindUsedVars' as 'off', the function finds variables that are not used in context but that are defined in the workspace specified by SourceType.

Example: 'FindUsedVars','off'

**IncludeEnumTypes** — Find enumerated types that are used

'off' (default) | 'on'

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of 'IncludeEnumTypes' and 'on' or 'off'. The function finds enumerated types that are used explicitly in context as well as types that define variables that are used in context.

The function does not report details about which blocks or objects are using the enumerated types.

If you specify SourceType as 'base workspace', 'model workspace', or 'mask workspace', the function does not report enumerated types because those sources cannot define enumerated types.
You cannot find unused enumerated types by specifying FindUsedVars as 'off'.
Example: 'IncludeEnumTypes','on'

**RegExp — Enable regular expression matching**

'off' (default) | 'on'

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of 'RegExp' and 'on'. You can match only input arguments that have character vector values.
Example: 'RegExp','on'

**SearchMethod — Compile status**

'compiled' (default) | 'cached'

Compile status, specified as the comma-separated pair consisting of 'SearchMethod' and one of these values:

- 'compiled' — Return up-to-date results by compiling every model in the search context before search.
- 'cached' — Return quicker results by using results cached during the previous compile.

Example: 'SearchMethod','compiled'

**SearchReferencedModels — Enable search in referenced models**

'off' (default) | 'on'

Flag to enable search in referenced models, specified as the comma-separated pair consisting of 'SearchReferencedModels' and 'on'.

If a referenced model uses a global variable, such as a variable stored in a data dictionary, the function returns this global variable when called on the parent model. If SearchReferencedModels is set to 'on', the Simulink.VariableUsage object returned by the function specifies a block in the referenced model as the variable user. Otherwise, the object specifies the Model block as the user.

Example: 'SearchReferencedModels','on'

**Name — Name of a variable or enumerated type to search for**

character vector | string
Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of 'Name' and a character vector or string.

Example: 'Name','trans'

Data Types: char

**SourceType** — **Workspace or source defining the variables or enumerated types**

character vector | string

Workspace or source defining the variables, specified as the comma-separated pair of 'SourceType' and one of these options:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

The function filters results for variables that are defined in the specified source.

Example: 'SourceType','base workspace'

If you search for enumerated data types by specifying 'IncludeEnumTypes' as 'on', 'SourceType' represents the way an enumerated type is defined. You can specify one of these options:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

The function filters results for enumerated types that are defined in the specified source.

Example: 'SourceType','MATLAB file'

If you do not specify SourceType, the function does not filter results by source.

**Users** — **Name of block to search for variables**

character vector | string

Name of specific block to search for variables, specified as the comma-separated pair consisting of 'Users' and a character vector or string.

To search a set of specific blocks, enable regular expression matching by specifying RegExp as 'on' and use regular expressions in the character vector. For example, you
can specify 'Users','MyModel/Gain* to search all blocks in MyModel whose names begin with Gain.

Example: 'Users','MyModel/Gain1'
Example: 'Users','MyModel/mySubsystem/Gain2'
Example: 'Users','MyModel/Gain*

**Limitations**

Simulink.findVars does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

However, Simulink.findVars can find enumerated types anywhere they are used in MATLAB Function blocks.

- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using ssRegisterDataType

To make the variables searchable, use ssRegisterTypeFromNamedObject instead.

- Variables referenced by machine-parented data in Stateflow.
- Variables inside a string.

Simulink.findVars discovers variable usage in inactive subsystem variants only if you select Analyze all choices during update diagram and generate preprocessor conditionals in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

**See Also**

Simulink.VariableUsage | find_system | intersect

**Topics**

“Search Using Model Explorer”
“Manage Design Data”
Introduced in R2010a
Simulink.fmuexport.ExportSimulinkProjectToFMU

Export project as Functional Mockup Unit (FMU)

Syntax

Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value)

Description

Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value) exports a project as a Functional Mockup Unit (FMU) and sets the model as the main interface model.

Examples

Export Model and Set Logo

Export EngineGasDynamics.slx in the current project:

Simulink.fmuexport.ExportSimulinkProjectToFMU(slproject.getCurrentProject, 'EngineGasDynamics.slx', '-fmuname', 'EngineGasDynamics.fmu', '-fmuicon', 'Simulink_Logo.png')

Input Arguments

- **project** — Project to export
  - string (default)
  - Data Types: string

- **model** — Model that defines the main interface
  - string (default)
Data Types: string

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example:

- **-fmuName** — The location and name of the generated FMU relative to the current working folder
  string

If not specified, FMU is saved to current directory folder with the same name as the main model.

Data Types: string

- **-description** — The description of the generated FMU
  string (default)

The information is saved in modelDescription.xml inside FMU.

Data Types: string

- **-author** — The author of the generated FMU
  string (default)

The information is saved in modelDescription.xml inside FMU.

Data Types: string

- **-copyright** — The copyright of the generated FMU
  string (default)

The information is saved in modelDescription.xml inside FMU.

Data Types: string

- **-license** — The license of the generated FMU
  string (default)
The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

`-fmuicon` — An icon file for the generated FMU

string (default)

The icon file must be in PNG format. If not specified, generated FMU has no icon file.

Data Types: `string`

Introduced in R2018b
Simulink.getFileChecksum

Checksum of file

Syntax

checksum = Simulink.getFileChecksum(filename)

Description

checksum = Simulink.getFileChecksum(filename) returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use Simulink.getFileChecksum to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from Simulink.getFileChecksum stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use Simulink.BlockDiagram.getChecksum instead. Simulink.BlockDiagram.getChecksum looks at the functional aspect of the model. If the functional aspect doesn't change, then Simulink.BlockDiagram.getChecksum returns the same checksum.

For example, if you moved a block, the file contents are different (measured by Simulink.getFileChecksum) but the function of the model is unchanged (measured by Simulink.BlockDiagram.getChecksum).

Examples

Get Checksum of a File

Use fullfile to specify a full path to a file and get the checksum.
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot,'toolbox',...
'matlab','demos','gatlin.mat'));

**Input Arguments**

filename — File name to get checksum for
file of any type

File name to get checksum for, with file extension and optional full path. Use fullfile to specify a full path to a file, or use the form 'C:\Work\filename.mat'.

Example: 'lengthofline.m'

Data Types: char

**Output Arguments**

checksum — Checksum value
character vector

Checksum value in a 32-character vector.

Simulink.BlockDiagram.getChecksum | Simulink.SubSystem.getChecksum

Introduced in R2014b
Simulink.getSuppressedDiagnostics

Return Simulink.SuppressedDiagnostic objects associated with a block, subsystem, or model

Syntax

suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)

Description

suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
returns an array of Simulink.SuppressedDiagnostic objects that are associated with the specified source.

Examples

Get All Simulink.SuppressedDiagnostic Objects on a Specific Block

Using the model from “Suppress Diagnostic Messages Programmatically”, get all suppressed diagnostics associated with a specified block.

Use the Simulink.suppressDiagnostic function to suppress the parameter precision loss warning thrown by the Constant block, one.

Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one','SimulinkFixedPoint:util:fxpParameterPrecisionLoss');

Get the Simulink.SuppressedDiagnostic objects associated with the block.

suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')
suppressed_diagnostic =

SuppressedDiagnostic with properties:
Input Arguments

source — System, block, or model object throwing warning
model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the gcb function.

To get the block handle, use the getSimulinkBlockHandle function.

Data Types: char | cell

Output Arguments

suppressed_diagnostics — Suppressed diagnostics
array

Suppressed diagnostics, returned as an array of Simulink.SuppressedDiagnostic objects.

Simulink.ID.getHandle

Get handle of block, annotation, or Stateflow object

Syntax

hdl = Simulink.ID.getHandle(simulinkID)

Description

hdl = Simulink.ID.getHandle(simulinkID) returns the handle of the block, annotation, or Stateflow object that has the Simulink Identifier simulinkID.

Examples

Get Handle of Model Block

Open the model vdp.

vdp

Get the SID of the Sum block.

Simulink.ID.getSID('vdp/Sum')

ans =
'vedp:8'

Get the handle of the Sum block using the SID.
hdl = Simulink.ID.getHandle('vdp:8')

**Input Arguments**

**simulinkID** — Simulink Identifier
character vector | string scalar

Simulink Identifier of a block, annotation, or Stateflow object, specified as a character vector or string scalar.

Example: 'vdp:4'

**Output Arguments**

**hdl** — handle
double | object handle

Handle of a block, annotation, or Stateflow object, returned as a double or a Stateflow object handle.

**See Also**

Simulink.ID.getSID

**Topics**

“Get a Simulink Identifier”

**Introduced in R2009b**
Simulink.ID.getSID

Get Simulink Identifier of block, annotation, or Stateflow object

Syntax

simulinkID = Simulink.ID.getSID(obj)

Description

simulinkID = Simulink.ID.getSID(obj) returns the Simulink Identifier (SID) of the block, annotation, or Stateflow object obj.

A Simulink Identifier (SID) is a unique and unmodifiable identifier. Use the SID to identify an object throughout its lifetime, even if the name of the object changes.

Examples

Get SID of Model Block

Open the model vdp.

vdp

Get the SID of the Mu block.

simulinkID = Simulink.ID.getSID('vdp/Mu')

Get SID of Annotation

Open the model vdp.

vdp
Select the annotation at the top of the diagram. To get the annotation object, use the function `getCurrentAnnotation`.

```matlab
ann = getCurrentAnnotation
```

Get the SID of the annotation.

```matlab
simulinkID = Simulink.ID.getSID(ann)
```

**Get SID of Model Block Using Handle**

Open the model `vdp`.

```matlab
vdp
```

Get the handle of the Product block.

```matlab
hdl = getSimulinkBlockHandle('vdp/Product')
```

Get the SID of the Product block using the handle as the input argument.

```matlab
simulinkID = Simulink.ID.getSID(hdl)
```

**Input Arguments**

`obj` — Name or handle of block, annotation, or Stateflow object

character vector | string scalar | handle

Name or handle of a block, annotation, or Stateflow object, specified as a handle, character vector, or string scalar.

Example: `'vdp/Mu'`

**Output Arguments**

`simulinkID` — Simulink Identifier

string scalar

Simulink Identifier (SID), returned as a string scalar.
See Also
Simulink.ID.getHandle | Simulink.ID.hilite

Topics
“Get a Simulink Identifier”

Introduced in R2009b
**Simulink.ID.hilite**

Highlight block, annotation, or Stateflow object

**Syntax**

Simulink.ID.hilite(simulinkID)
Simulink.ID.hilite(simulinkID,style)

**Description**

Simulink.ID.hilite(simulinkID) highlights the block, annotation, or Stateflow object that has the Simulink Identifier simulinkID.

Simulink.ID.hilite(simulinkID,style) uses the specified highlighting style.

**Examples**

**Highlight Block**

Open the model vdp.

dp

Get the Simulink Identifier of the Mu block.

muSID = Simulink.ID.getSID('vdp/Mu')

Highlight the Mu block.

Simulink.ID.hilite(muSID)
Highlight Block Using a Highlight Style

Open the model vdp.

vdp

Get the Simulink Identifier of the Mu block.

muSID = Simulink.ID.getSID('vdp/Mu')

Highlight the Mu block using the style 'fade'.

Simulink.ID.hilite(muSID, 'fade')

Input Arguments

simulinkID — Simulink Identifier
character vector | string scalar

Simulink Identifier of a block, annotation, or Stateflow object, specified as a character vector or string scalar.

Example: 'vdp:4'

style — Highlighting style
'default' (default) | character vector | string scalar

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-393.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, in the Simulink Editor, select Display > Remove Highlighting.

- 'debug' — Uses default color scheme.
- 'different' — Applies red outline, white fill.
- 'error' — Uses default color scheme.
- 'fade' — Applies gray outline, white fill.
• 'find' — Applies dark blue outline, blue fill.
• 'lineTrace' — Applies red outline, blue fill.
• 'unique' — Dark blue outline, white fill.
• 'user1','user2','user3','user4','user5' — Applies custom highlight: black outline, white fill by default (that is, no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color:

• 'orangeWhite'
• 'blackWhite'
• 'redWhite'
• 'blueWhite'
• 'greenWhite'

Topics
“Get a Simulink Identifier”

Introduced in R2009b
Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

Syntax

importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes(____,Name,Value)

Description

importInfo = Simulink.importExternalCTypes(headerFiles) parses the C or C++ header files (.h or .hpp) identified by headerFiles for typedef, struct, and enum type definitions, and generates Simulink representations of the types. The output, importInfo, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.
- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see “Exchange Structured and Enumerated Data Between Generated and External Code” (Embedded Coder).
- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.
  - To create structures of signals in Simulink, use nonvirtual buses. See “Getting Started with Buses”.
  - To create structures of parameters, use MATLAB structures and Simulink.Parameter objects. See “Organize Related Block Parameter Definitions in Structures”.

2-759
• To create enumerated data, see “Use Enumerated Data in Simulink Models”.
• To match a primitive typedef statement, use a Simulink.AliasType object to set parameter and signal data types in a model.

By default, the function:

• Imports an enumerated type by generating a script file that derives an enumeration class from Simulink.IntEnumType, as described in “Define Simulink Enumerations”. If necessary, you can then edit the class definition to customize it (for example, by implementing the addClassNameToEnumNames method).
• Imports a structure type by generating a Simulink.Bus object in the base workspace.
• Imports a primitive typedef statement by generating a Simulink.AliasType object in the base workspace.
• Interprets generic C data types, such as int or short, according to the word lengths of your host computer. For example, for most modern machines, int has a 32-bit word length, so the function represents an int structure field as a bus element that uses the Simulink data type int32.

To override this default behavior, identify your target hardware board by using the HardwareImplementation pair argument.

For additional information about default behavior, see “Tips” on page 2-778.

importInfo = Simulink.importExternalCTypes(modelName) generates Simulink representations of custom C data types by analyzing a model that you identify with modelName. When you use the Simulation Target configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as HardwareImplementation, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

importInfo = Simulink.importExternalCTypes(____,Name,Value) specifies additional options using one or more name-value pair arguments. You can use this syntax to:
• Specify the names of types to import by using the Names pair argument.
• Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the MATFile and DataDictionary pair arguments.
• Control the way that the function interprets generic C data types. Use the HardwareImplementation pair argument.
• Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the Overwrite and Verbose pair arguments.

Examples

Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (struct) and an enumerated (enum) data type from a header file.

1 In your current folder, create the file ex_cc_simpleTypes.h.

    typedef enum {
        PWR_LOSS = 0,                 /* Default value */
        OVERSPD,
        PRESS_LOW,
    } fault_T;

    typedef struct {
        double coeff;
        double init;
    } params_T;

2 Generate Simulink representations of the types by calling Simulink.importExternalCTypes.

    Simulink.importExternalCTypes('ex_cc_simpleTypes.h');

    The function creates a Simulink.Bus object, params_T, in the base workspace.

3 To inspect the properties of the object, open the Bus Editor.

    buseditor
Each bus element uses a name and a data type (double) that match the corresponding structure field in ex_cc_simpleTypes.h.

4 In your current folder, inspect the generated file, fault_T.m, which defines the enumerated type fault_T as an enumeration class.

You can use the bus object and the enumeration class to set signal and parameter data types in Simulink models.

Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (typedef).

Create the file ex_integer_aliases.h in your current folder.

typedef int sint_32;
typedef unsigned short uint_16;

Create the file ex_cc_struct_alias.h in your current folder.

#include "ex_integer_aliases.h"

typedef struct {
    sint_32 accum;
    uint_16 index;
} my_ints_T;

Import the structure type into Simulink as a Simulink.Bus object in the base workspace. Import the typedef statements as Simulink.AliasType objects.

Simulink.importExternalCTypes('ex_cc_struct_alias.h');

Inspect the data types of the bus elements in the bus object. For example, inspect the DataType property of the first bus element, which corresponds to the structure field accum.

my_ints_T.Elements(1)

ans =
BusElement with properties:

Name: 'accum'
Complexity: 'real'
Dimensions: 1
DataType: 'sint_32'
Min: []
Max: []
DimensionsMode: 'Fixed'
SampleTime: -1
Unit: ''
Description: ''

The `Simulink.importExternalCTypes` function uses the generated `Simulink.AliasType` objects to set the data types of the bus elements.

Inspect the `Simulink.AliasType` objects in the base workspace. For example, the object named `sint_32` corresponds to one of the `typedef` statements in `ex_integer_aliases.h`.

`sint_32`

`sint_32` =

AliasType with properties:

Description: ''
DataScope: 'Imported'
HeaderFile: 'ex_integer_aliases.h'
BaseType: 'int32'

For most host computers (which the function targets by default), the word length of `int` is 32 bits and the word length of `unsigned short` is 16 bits. The function maps `int` and `unsigned short` to the Simulink types `int32` and `uint16`.

If you have Embedded Coder, the code that you generate from the model can use `sint_32` and `uint_16` instead of the standard data type names, `int32_T` and `uint16_T`. 

2-763
Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file ex_cc_simpleTypes.h.

```c
typedef enum {
    PWR_LOSS = 0,            /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

Create a subfolder called myDictionaries.

```bash
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling Simulink.importExternalCTypes. Permanently store the type definitions by creating a new data dictionary, ex_cc_myTypes.sldd, in the new subfolder.

```bash
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',
    'DataDictionary','ex_cc_myTypes.sldd',
    'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to myDictionaries and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See “Migrate Models to Use Simulink Data Dictionary”.

Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.
In your current folder, create the file `ex_cc_manySimpleTypes.h`. The file defines three structure types: `params_T`, `signals_T`, and `states_T`.

```c
typedef struct {
    double coeff;
    double init;
} params_T;

typedef struct {
    double flow_rate;
    double steam_press;
} signals_T;

typedef struct {
    double accum;
    double error;
} states_T;
```

Generate Simulink representations only for `params_T` and `signals_T`.

```matlab
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h',
    'Names',{'params_T','signals_T'});
```

**Import Types for 16-Bit Hardware**

By default, `Simulink.importExternalCTypes` represents an enumerated data type by creating an enumeration class that derives from the built-in class `Simulink.IntEnumType`. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example, on the **Hardware Implementation** pane) determine the specific integer length that `Simulink.IntEnumType` and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as `short` and `int`, according to the word lengths of your host computer. For example, to represent an `int` structure field, the function typically applies the 32-bit data type `int32` to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the `HardwareImplementation` pair argument to identify the target hardware and, by extension, the word lengths of the hardware.
This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, int has a 16-bit length, and each item of enumerated data (enum) consumes 16 bits.

In your current folder, create the file ex_cc_intTypes.h.

typedef enum {
    PWR_LOSS = 0,            /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    int coeff;
    int init;
} params_T;

The code defines an enumerated data type and a structure type whose fields use the generic C data type int.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named ex_hdwImpl_16bit.

In the new model, set Configuration Parameters > Hardware Implementation > Device vendor to Atmel. Set Device type to AVR.

Alternatively, at the command prompt, use these commands to create and configure the model:

```matlab
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the Hardware Implementation settings) as a Simulink.ConfigSet object.

```matlab
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The Simulink.Bus object params_T appears in the base workspace. The bus elements, such as coeff, use the Simulink data type int16.
params_T.Elements(1)

ans =

    BusElement with properties:
        Name: 'coeff'
        Complexity: 'real'
        Dimensions: 1
        DataType: 'int16'
        Min: []
        Max: []
        DimensionsMode: 'Fixed'
        SampleTime: -1
        Unit: ''
        Description: ''

In your current folder, the file fault_T.m defines the enumeration class fault_T. The class derives from Simulink.IntEnumType, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

**Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types**

Create the file ex_cc_fixpt_struct.h in your current folder.

typedef struct {

    int coeff;   /* Word length 16,
                  binary fraction length 7 */

    int init;   /* Word length 16,
                  binary fraction length 3 */

} params_T;

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field coeff in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.
Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```matlab
hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';
```

Generate a Simulink representation of the structure type.

```matlab
Simulink.importExternalCTypes('ex_cc_fixpt_struct.h', ...
    'HardwareImplementation', hdw);
```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```matlab
params_T.Elements(1)
```

```matlab
ans =

    BusElement with properties:

    Name: 'coeff'
    Complexity: 'real'
    Dimensions: 1
    DataType: 'int16'
    Min: []
    Max: []
    DimensionsMode: 'Fixed'
    SampleTime: -1
    Unit: ''
    Description: ''
```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```matlab
params_T.Elements(1).DataType = 'fixdt(1,16,7)';
params_T.Elements(2).DataType = 'fixdt(1,16,3)';
```

To specify the data types interactively (by using the Data Type Assistant), use the Bus Editor.
Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

Import Custom C Types

Create the file `ex_cc_myTypes_rec.h` in your current folder. The file defines a custom structure type.

```c
typedef struct {
    double flow;
    double pres;
    double tqe;
} sigStructType;
```

Generate a Simulink.Bus object that represents the type.

```c
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

Modify Type Definition in C Code

In `ex_cc_myTypes_rec.h`, add a field named `spd` to `sigStructType`.

In the same file, create a new structure type, `stateStructType`.

```c
typedef struct {
    double flow;
    double pres;
    double tqe;
    double spd;
} sigStructType;

typedef struct {
    double err;
    double read;
    double write;
} stateStructType;
```
**Attempt to Import Types Again**

Attempt to generate bus objects that represent the types.

```matlab
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```matlab
importInfo.failedToImport.Bus
```

```matlab
ans =
1×1 cell array
{'sigStructType'}
```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the `report` field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```matlab
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h',...
    'Names',importInfo.failedToImport.Bus,'Overwrite','on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

**Input Arguments**

`headerFiles` — Names and paths of header files to parse

character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (#include) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses
the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the IncludeDirs pair argument to identify the additional folders.

Example: 'myHeader.h'
Example: {'thisHeader.hpp','thatHeader.hpp'}

Data Types: char | cell | string

[modelName — Name of loaded Simulink model for which to import types](#)

cell | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the load_system function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the Simulation Target pane affect this search.

For example, if in the model you set Configuration Parameters > Simulation Target > Insert custom C code in generated > Header file to #include "myTypes.h", the function parses myTypes.h for types to import.

- Interprets generic C data types such as int or short according to the word lengths of your host computer. Do not use the HardwareImplementation pair argument to override this interpretation.

Example: 'myModel'

Data Types: char | string

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example:
Simulink.importExternalCTypes('myHdr.h','DataDictionary','myDictionary.sldd')
**MATFile — Name and path of MAT-file to create for storing generated objects**

'' (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated Simulink.Bus and Simulink.AliasType objects, specified as a character vector or string. If you do not use MATFile, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some struct types and primitive typedef statements by using MATFile and later import some of the same types again by using MATFile, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the MATFile and DataDictionary pair arguments simultaneously.

Example: 'myMat.mat'
Example: 'myMat'
Example: fullfile('subfolder','myMat')

Data Types: char | string

**DataDictionary — Name and path of Simulink data dictionary to use or create for storing types**

'' (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as Simulink.data.dictionary.EnumTypeDefinition objects, and stores those objects (as well as Simulink.Bus objects and Simulink.AliasType objects) in the target dictionary.

For information about data dictionaries, see “What Is a Data Dictionary?”.  

You can optionally specify a .sldd extension.

You cannot use the DataDictionary and MATFile pair arguments simultaneously.

Example: 'myDict.sldd'
Example: 'myDict'
Example: `fullfile('subfolder','myDict.sldd')`

Data Types: `char` | `string`

**Names — Names of types to import**

' ' (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (*).

Example: 'myEnumType'
Example: {'myEnumType','myStructType'}
Example: 'my*Type'

Data Types: `char` | `cell` | `string`

**Defines — Compiler options to define macros that influence type definitions**

' ' (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: 'SIGSTRUCT=1'
Example: 'SIGSTRUCT=1 ENUM=1'

Data Types: `char` | `string`

**UnDefines — Compiler options to delete macros that influence type definitions**

' ' (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.
Use **UnDefines** to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: 'SIGSTRUCT'
Example: 'SIGSTRUCT_ENUM'

**Data Types:** char | string

**IncludeDirs — Folders that contain subordinate, included header files**

'' (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (#include) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the **headerFiles** argument) depend.

If you use the **modelName** syntax instead of the **headerFiles** syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the **IncludeDirs** pair argument.

Example: 'myHeaders'
Example: fullfile('myProject','myHeaders')
Example:
{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}

**Data Types:** char | cell | string

**OutputDir — Folder for storing generated files**

'' (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as **classdef** script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: 'myDictionaries'
Example: fullfile('myProject','myDictionaries')

**Data Types:** char | string
HardwareImplementation — Word lengths for interpreting generic, primitive C
data types
'' (default) | Simulink ConfigSet object | coder HardwareImplementation object

Word lengths for interpreting generic, primitive C data types, specified as a Simulink ConfigSet or coder HardwareImplementation object.

- To use a Simulink ConfigSet object, you can extract a configuration set from a model by using functions such as getConfigSet and getActiveConfigSet. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the Hardware Implementation configuration parameters).
- To use a coder HardwareImplementation object (which you create and configure programmatically), specify properties of the object, such as ProdHWDeviceType, to identify your target hardware. The object then sets other properties, such as ProdBitPerInt, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as int. For example, if you create a coder HardwareImplementation object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type int, the function generates a bus object whose bus elements use the Simulink data type int16. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see “Configure Run-Time Environment Options” (Simulink Coder).

Overwrite — Specification to overwrite existing Simulink representations
'off' (default) | 'on'

Specification to overwrite existing Simulink representations, specified as 'on' or 'off'. If an imported type already has a representation in Simulink:

- If you specify 'off' or if you do not specify Overwrite, the function does not import the type. In the output argument, importInfo, the failedToImport field identifies the type.
- If you specify 'on', the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set Overwrite to 'on', the function does not preserve your customizations. These customizations can include:
• In an enumeration class definition, implementing extra methods or modifying the generated methods such as `getDataScope` (see “Customize Simulink Enumeration”).
• Modifying the properties of a generated `Simulink.Bus` or `Simulink.AliasType` object (for example, manually setting the data types of bus elements to a fixed-point data type).

**Verbose — Specification to generate messages for successful import operations**

`'off'` (default) | `'on'`

Specification to generate messages for successful import operations, specified as `'on'` or `'off'`.

• If you specify `'off'` or if you do not specify **Verbose**, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.
• If you specify `'on'`, the function generates a message in the Command Window for each operation during the import process.

**Output Arguments**

**importInfo — Information about types that were imported and not imported**

structure

Information about types that were imported and not imported, returned as a structure with these fields.

**report — Descriptions of types that were imported and not imported**

character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

**failedToImport — Types that were not imported**

structure

Types that were not imported, returned as a structure with these fields.
<table>
<thead>
<tr>

</tr>
<tr>
<td>AliasType</td>
<td>Cell array of character vectors</td>
<td>Names of primitive typedef statements that were imported. The generated Simulink.AliasType objects use these names.</td>
</tr>
</tbody>
</table>
Limitations

- The function does not support:
  - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for `long double`. For information about data types that Simulink supports, see “Data Types Supported by Simulink”.
  - Pointer types, such as a structure that defines a field whose value is a pointer or a `typedef` statement whose base type is a pointer type.
  - Structures that define a field whose value has more than one dimension. If a field value is a 1-D array, the function creates a bus element that represents a vector, not a matrix.
  - Unions.
  - If a structure field represents fixed-point data, or if a `typedef` statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or `Simulink.AliasType` object to the relevant Simulink integer type (such as `int16`). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the `Simulink.AliasType` object by using the `fixdt` function.

Tips

- If a MATLAB Function block or Stateflow chart in your model uses an imported enumeration or structure type, configure the model configuration parameters to include (`#include`) the type definition from your external header file. See “Control Imported Bus and Enumeration Type Definitions” (for a MATLAB Function block) and “Access Custom Code Variables and Functions in Stateflow Charts” (Stateflow) and “Integrate Custom Structures in Stateflow Charts” (Stateflow) (for a chart).
  - By default:
    - For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as `Production device vendor and type` and `Native word size in production hardware`. 
• For an imported structure type:
  • The function imports a structure field as numerically complex only if the field
    uses one of the corresponding Simulink Coder structure types as the data type.
    For example, if a structure field in your external code uses the data type
    cint8_T, the function imports the field as a bus element
    (Simulink.BusElement object) whose data type is int8 and whose
    Complexity property is set to 'complex'.
  • For nested structures, the function generates a bus object for each unique
    structure type.
  • For an imported structure type or enumeration, if your external code uses a
    typedef statement to name the type, the name of the generated bus object or
    Simulink enumeration class matches the typedef name. If your code does not use
    a typedef statement, the name of the object or class is struct_type
    or enum_type where type is the tag name of the type. If you do not specify a tag
    name or apply a typedef name, Simulink generates an arbitrary name for the
    object or class.
  • The function configures the generated Simulink representations as imported for
    the purposes of simulation and code generation. For example, for bus objects, the
    function sets the DataScope property to 'Imported' and the HeaderFile
    property to the name of your external header file. To simulate or generate code
    from a model that uses one of these Simulink representations, you must make your
    header file available to the model.
• When you specify files for Simulink.importExternalCTypes to use or generate,
  for example, by using the DataDictionary pair argument:
  • If the existing files to use are in your current folder or on the MATLAB path, you do
    not need to specify a file path. You can specify the file name by itself.
  • To control the folder location of generated files, you can specify paths as well as file
    names. You can also use the OutputDir pair argument.

“Exchange Data Between External C/C++ Code and Simulink Model or Generated Code” (Simulink Coder)

**Introduced in R2017a**
Simulink.ModelDataLogs.convertToDataset

Convert logging data from Simulink.ModelDataLogs format to Simulink.SimulationData.Dataset format

Syntax

```matlab
convertedDataset = sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

Description

**Note** The ModelDataLogs class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the ModelDataLogs format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used ModelDataLogs format, the model simulated in use Dataset format.

You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the ModelDataLogs API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

```matlab
convertedDataset = sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

converts the `sourceModelDataLogsObject` to a Simulink.SimulationData.Dataset object. The name of the converted object is based on `convertedDatasetName`.

The resulting Simulink.SimulationData.Dataset object is a flat list. This list has one element for each Simulink.Timeseries or Simulink.TsArray object in the Simulink.ModelDataLogs object.
Limitations

<table>
<thead>
<tr>
<th>Source of Simulink.ModelDataLogs Logged Data</th>
<th>Conversion Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referenced model</td>
<td>Loads all ancestors of the referenced model not previously loaded. If any ancestor model does not appear on the MATLAB path, the conversion fails. If the model has changed, or the model ancestors have changed, after Simulink logged the data, the conversion can fail. For example, adding, deleting, or renaming a block after logging can cause conversion failure.</td>
</tr>
<tr>
<td>Variant model or subsystem</td>
<td>The current active variant must be the same one that was active when Simulink logged the data. Otherwise, the conversion fails.</td>
</tr>
<tr>
<td>Frame signal</td>
<td>The conversion fails.</td>
</tr>
<tr>
<td>Mux block</td>
<td>The conversion produces a different Simulink.SimulationData.Dataset object as the dataset than Simulink creates when you simulate the model using the Dataset format for the logged data.</td>
</tr>
<tr>
<td>Stateflow chart</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>

Input Arguments

**sourceModelDataLogsObject**

A Simulink.ModelDataLogs object that you want to convert to a Simulink.SimulationData.Dataset object.

**convertedDatasetName**

Name of the dataset that the conversion process creates.
Output Arguments

convertedDataset

The Simulink.SimulationDataset object that the Simulink.ModelDataLogs.convertToDataset function creates.

For details about the converted dataset, see Simulink.SimulationData.Dataset.

Example

In releases before R2016a, you could log signals using ModelDataLogs format. If you have a MAT-file with signal logging data that uses the ModelDataLogs format, here is how you can convert that data to Dataset format. This example assumes that the model that generated the logging data had the Configuration Parameters > Data Import/Export > Signal logging name set to logsout.

1 Load the MAT-file.
2 Convert logsout to a dataset called myModel_dataset. (The elements information will be different for your data.)

   dataset = logsout.convertToDataset('myModel_Dataset')

   dataset =
   Simulink.SimulationData.Dataset
   Package: Simulink.SimulationData

   Characteristics:    Name: 'myModel_Dataset'
                      Total Elements: 2

   Elements:
      1: 'x1'
      2: 'x2'

   -Use get or getElement to access elements by index or name.
   -Use addElement or setElement to add or modify elements.

Introduced in R2011a
Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

Syntax

Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')

Description

Simulink.restoreDiagnostic(source) restores all suppressed diagnostics associated with the blocks specified by source.

Simulink.restoreDiagnostic(source, message_id) restores all instances of message_id on the blocks specified by source.

Simulink.restoreDiagnostic(diagnostic) restores the suppressed diagnostics associated with MSLDiagnostic object diagnostic.

Simulink.restoreDiagnostic(system, 'FindAll', 'on') restores all suppressed diagnostics associated with the system specified by system.

Examples

Restore All Diagnostics for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the Simulink.suppressDiagnostic function to suppress these multiple diagnostics from the Constant block, one.
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', ...
'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);

Remove all suppressions and restore diagnostics to the block.
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');

**Restore a Diagnostic for a Specified Block**

Using the model from “Suppress Diagnostic Messages Programmatically”, restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');

Remove the suppression and restore diagnostics to the block.

Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');

**Restore All Diagnostics for a Specified System**

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use 'FindAll', 'on' to search within the system hierarchy. Specify the system or system handle within which to search.

Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert',...
'FindAll', 'On');

**Input Arguments**

*source* — Block or model object throwing diagnostic

block path | block handle
The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the \texttt{gcb} function.

To get the block handle, use the \texttt{getSimulinkBlockHandle} function.

Data Types: char | cell

\textbf{message\_id — message identifier of diagnostic}

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the \texttt{ExecutionInfo} property of the \texttt{Simulink.SimulationMetadata} object associated with a simulation. You can also use the \texttt{lastwarn} function.

Data Types: char | cell

\textbf{system — Name of subsystem}

character vector

The subsystem name, or handle, specified as a character vector.

Data Types: char

\textbf{diagnostic — Diagnostic object}

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the \texttt{ExecutionInfo} property of the \texttt{Simulink.SimulationMetadata} object.

Data Types: struct

Introduced in R2016b
getBlockSimState

**Class:** Simulink.SimState.ModelSimState  
**Package:** Simulink.SimState

(Not recommended) Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

---

**Note** Simulink.SimState.ModelSimState.getBlockSimState is not recommended. Use get instead.

---

**Syntax**

```matlab
blockSimState = getBlockSimState(x, 'blockpath')
```

**Description**

`blockSimState = getBlockSimState(x, 'blockpath')` returns the SimState of the block specified as `blockpath`. `blockpath` must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

**Input Arguments**

*x*

The `x` argument is a `Simulink.SimState.ModelSimState` object.

**blockpath**

The path to the block for which you are requesting the SimState values.
Output Arguments

blockSimState

The SimState of the block specified.

Examples

chartState = getBlockSimState(x, 'mymodel/chart')

To get the SimState of a block that is in a referenced model, specify the full path of the block relative to the root model.

rootModel = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveCompleteFinalSimState','on','StopTime','1');
simOut = sim(rootModel,opt);
x = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';
chartState = getBlockSimState(x,blockPath)

See Also

Simulink.SimState.ModelState.setBlockSimState
**setBlockSimState**

**Class:** Simulink.SimState.ModelSimState  
**Package:** Simulink.SimState

(Not recommended) Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

---

**Note** Simulink.SimState.ModelSimState.setBlockSimState is not recommended. Use set instead.

---

**Syntax**

```matlab
setBlockSimState(x,'blockpath', blockSimState)
```

**Description**

`setBlockSimState(x,'blockpath', blockSimState)` sets the SimState of the block specified as `blockpath`. `blockpath` must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

**Input Arguments**

- **x**
  
  The argument `x` is a `Simulink.SimState.ModelSimState` object.

- **blockpath**
  
  The path to the block for which you are setting the SimState values
**blockSimState**

The SimState of the block specified.

**Examples**

```matlab
newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);
```

`Simulink.SimState.ModelState.getBlockSimState`
Simulink.saveVars

Save workspace variables and their values in MATLAB code format

Syntax

Simulink.saveVars(filename)
Simulink.saveVars(filename, VarNames)
Simulink.saveVars(filename, '-regexp', RegExps)
Simulink.saveVars(filename, Specifications, UpdateOption)
Simulink.saveVars(filename, Specifications, Configuration)
Simulink.saveVars(filename, Specifications, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, Specifications)

Description

Simulink.saveVars(filename) saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named filename.m. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named filename.mat, and a warning is generated. If either file already exists, it is overwritten. The filename cannot match the name of any variable in the current workspace, and can optionally include the suffix .m. Using Simulink.saveVars has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.
You can edit a MATLAB file that Simulink.saveVars creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use Simulink.saveVars to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. Simulink does not check that a manually edited MATLAB file is syntactically correct. MathWorks recommends not editing any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

Simulink.saveVars(filename, VarNames) saves only the variables specified in VarNames, which is a comma-separated list of variable names. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

Simulink.saveVars(filename, '-regexp', RegExps) saves only variables whose names match one of the regular expressions in RegExps, which is a comma-separated list of expressions. See “Regular Expressions” (MATLAB) for more information. A call to the function can specify both VarNames and -regexprs RegExps, in that order and comma-separated.

Simulink.saveVars(filename, Specifications, UpdateOption) saves the variables described by Specifications (which represents the variable specifications in any of the above syntaxes) as directed by UpdateOption, which can be any one of the following:

- '-create' — Create a new MATLAB file (and MAT-file if needed) as directed by the Specifications. If either file already exists, it is overwritten. This is the default behavior.
- '-update' — Update the existing MATLAB file (and MAT-file if needed) specified by filename by changing only variables that match the Specifications and already exist in any files. The order of the variables in files is preserved. Comments within MATLAB code sections are not preserved.
- '-append' — Update the existing MATLAB file (and MAT-file if needed) specified by filename by:
  - Updating variables that match the Specifications and already exist in the file or files, preserving the existing order in the file or files. Comments within MATLAB code sections are not preserved.
• Appending variables that match the Specifications and do not exist in the file or files by appending the variables to the file or files. These new sections initially have no comments.

Simulink.saveVars(filename, Specifications, Configuration) saves the variables described by Specifications (which represents the variable specifications in any of the above syntaxes) according to the specified Configuration. The Configuration can contain any or all of the following options, in any order, separated by commas if more than one appears:

• '-maxnumel' MaxNum — Limits the number of elements saved for an array to MaxNum, which must be an integer between 1 and 10000. For a character array, the upper limit is set to twice the value that you specify with MaxNum. If an array is larger than MaxNum, the whole array appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 1000

• '-maxlevels' MaxLevels limits the number of levels of hierarchy saved for a structure or cell array to MaxLevels, which must be an integer between 1 and 200. If a structure or cell array is deeper than MaxLevels, the whole entity appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 20

• '-textwidth' TextWidth sets the text wrap width in the MATLAB file to TextWidth, which must be an integer between 32 and 256. Default: 76

• '-2dslice' — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) char, logic, or numeric array data. Simulink.saveVars uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the -2dslice option. If you specify two integer arguments:
  • The two integers must be positive.
  • The two integers must be less than or equal to the number of dimensions of the n-D array.
  • The second integer must be greater than the first.

Simulink.saveVars(filename, Specifications, MatlabVer) acts as described by Specifications (which represents the specifications after filename in any of the above syntaxes) saving any MAT-file that it creates in the format required by the MATLAB version specified by MatlabVer. Possible values:

• '-v7.3' — 7.3 or later
• '-v7.0' — 7.0 or later
• `-v6' — Version 6 or later
• `-v4' — Any MATLAB version

\[ r1, r2 \] = Simulink.saveVars(filename, Specifications) acts as described by Specifications (which represents the specifications after filename in any of the above syntaxes) and reports what variables it has saved:

• \( r1 \) — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MATLAB file.
• \( r2 \) — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MAT-file.

**Input Arguments**

**filename**

The name of the file or names of the files that the function creates or updates. The filename cannot match the name of any variable in the current workspace. The filename can have the suffix .m, but the function ignores it.

**VarNames**

A variable or sequence of comma-separated variables. The function saves only the specified variables to the output file. You can use the wildcard character * to save all variables that match a pattern. The * matches one or more characters, including non-alphanumeric characters.

**'-regexp', RegExps**

After the keyword, a regular expression or sequence of comma-separated regular expressions. The function saves to the output file only those variables whose names match one of the expressions. See “Regular Expressions” (MATLAB) for more information A call to the function can specify both **VarNames** and **'-regexp' RegExps**, in that order and comma-separated.

**UpdateOption**

Any of three keywords that control the action of the function. The possible values are:

• `'create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the Specifications.
• `-update' — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by changing only variables that match the `Specifications` and already exist in the file or files. The order of the variables in the file or files is preserved.

• `-append' — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by:
  
  • Updating variables that match the `Specifications` and already exist in the file or files, preserving the existing order in the file or files.
  
  • appending variables that match the `Specifications` and do not exist in the file or files by appending the variables that match the `Specifications` to the file or files.

**Default:** `-create`

**Configuration**

Any or all of the following options, in any order, separated by commas if more than one appears:

• `-maxnumel` `MaxNum` — Limits the number of elements saved for an array to `MaxNum`, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000

• `-maxlevels` `MaxLevels` — Limits the number of levels saved for a structure or cell array to `MaxLevels`, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20

• `-textwidth` `TextWidth` — Sets the text wrap width in the MATLAB script file to `TextWidth`, which must be an integer between 32 and 256. Default: 76

• `-2dslice' — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) arrays of char, logic, or numeric data. Using the `-2dslice' option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

`Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

• The two integers must be positive.
• The two integers must be less than or equal to the number of dimensions of the n-D array.
• The second integer must be greater than the first.

**Note** You can use the MATLAB Preferences to change the defaults for the -maxnumel, -maxlevels, '-2dslice', and -textwidth configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

**MatlabVer**

Specifies the MATLAB version whose syntax will be used by any MAT-file saved by the function.

- ' -v7.3' — 7.3 or later
- ' -v7.0' — 7.0 or later
- ' -v6' — Version 6 or later
- ' -v4' — Any MATLAB version

**Default:** ' -v7.3'

**Output Arguments**

**r1**

A list of the names of all variables (if any) that were saved to a MATLAB file.

**r2**

A list of the names of all variables (if any) that were saved to a MAT-file.

**Examples**

Define some base workspace variables, then save them all to a new MATLAB file named **MyVars.m** using the default values for all input arguments except the **filename**.

```matlab
a = 1;
b = 2.5;
```
c = 'A string';
d = {a, b, c};
Simulink.saveVars('MyVars');

Define additional base workspace variables, then append them to the existing file
MyVars.m without changing the values previously saved in the file:

K = Simulink.Parameter;
MyType = fixdt(1,16,3);
Simulink.saveVars('MyVars', '-append', 'K', 'MyType');

Update the variables V1 and V2 with their values in a MATLAB file, or for any whose value
cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array
with more than 10 elements will be saved to a MAT-file that can be loaded on any version
of MATLAB. The return argument r1 lists the names of any variables saved to a MATLAB
file; r2 lists any saved to a MAT-file.

[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');

Specify a 2-D slice for the output of the my3Dtable 3-D array. Specify that the 2-D slice
expands along the first and third dimensions:

my3DTable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3DTable', '-2dslice', 1, 3);

The generated MATLAB code is:

my3DTable = zeros(3, 4, 2, 'single');
my3DTable (:,1,:) = single ( ...
[1 13;
 5 17;
 9 21]);
my3DTable (:,2,:) = single( ... [2 14;
 6 18;
10 22]);
my3DTable (:,3,:) = single( ... [3 15;
 7 19;
11 23]);
my3DTable (:,4,:) = single( ... [4 16;
 8 20;
12 24]);
Limitations

The Simulink.saveVars function:

• Does not preserve shared references.
• Ignores dynamic properties of objects.
• Saves the following to the MAT-file although they could appear in the MATLAB file:
  • Simulink.ConfigSet objects with custom target components.
    (Use the Simulink.ConfigSet method saveAs instead.)
  • Simulink.Timeseries and Simulink.ModelDataLogs objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

• Permanently store variables in a data dictionary instead of using Simulink.saveVars. A data dictionary also provides more tools for managing variables. See “Determine Where to Store Variables and Objects for Simulink Models”.
• Save variables in a MAT-file by using the save function.

Tips

• If you do not need to save variables in an easily-understood form, see the save function.
• If you need to save only bus objects, use the Simulink.Bus.save function.
• If you need to save only a configuration set, use the Simulink.ConfigSet.saveAs method.

Introduced in R2010a
Simulink.sdi.addToList

Package: Simulink.sdi

Add one or more signals to existing run

Syntax

sigIDs = Simulink.sdi.addToList(runID,'vars',var,var2,...,varn)
sigIDs = Simulink.sdi.addToList(runID,'namevalue',sourceNames, dataValues)

Description

sigIDs = Simulink.sdi.addToList(runID,'vars',var,var2,...,varn) adds the data in the variables var, var2, ..., varn to the run corresponding to the runID and returns the signal IDs for the signals added to the run.

sigIDs = Simulink.sdi.addToList(runID,'namevalue',sourceNames, dataValues) adds the data in the cell array dataValues to the run corresponding to the runID and returns the signal IDs for the signals added to the run. The sourceNames argument specifies names to use for the source of the data in dataValues in the signal metadata.

Examples

Add Workspace Data to Run

This example shows how to use Simulink.sdi.addToList to add workspace data to a run in the Simulation Data Inspector.

Generate Workspace Data

Generate workspace data to add to a simulation run in place of measured data, input data, or any other data that you want to associate with the simulation.
time = linspace(0, 60, 201);
cos_vals = 2*cos(2*pi/6.8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'cosine';

**Simulate Model**

Simulate the slexAircraftExample model to create a run containing the simulation outputs.

load_system('slexAircraftExample');
sim('slexAircraftExample','SaveFormat','Dataset');

**Add Workspace Data to Simulation Run**

Add the workspace data to the run. Then, view the results in the Simulation Data Inspector.

% Get run ID
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);

% Add data to run
sigIDs = Simulink.sdi.addToRun(runID,'vars',cos_ts);

Simulink.sdi.view

**Add States Data to a Run**

The model slexAircraftExample is configured to log outputs, states, and time data. The output data automatically logs to the Simulation Data Inspector as well as the base workspace, but the states data does not. To bring the states data into the Simulation Data Inspector, you can record the data, or you can add it to the run created by simulating the model. This example shows how to add logged states data to a Simulation Data Inspector run programmatically.

**Simulate the Model and Get States Data**

Simulate the model using the sim function with 'ReturnWorkspaceOutputs' set to 'on'. Select the states data, xout, from the simulation outputs.

load_system('slexAircraftExample')
simOut = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
'SaveFormat','Dataset');

% Get states data from simulation output
states = simOut.xout;

**Get the Run ID**

Because the outputs data automatically logs to the Simulation Data Inspector, a run is created upon simulating slexAircraftExample. Get the run ID for the run using the Simulation Data Inspector programmatic interface.

runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

**Add States Data to the Run**

Add the states data to the run with the output data.

sigIDs = Simulink.sdi.addToRun(runID,'namevalue',{'States'},{states});

**Input Arguments**

**runID** — Run ID to add data to

scalar

Run ID for the signal you want to add data to. The Simulation Data Inspector assigns a unique run ID when it creates a run. You can get the run ID for your run using Simulink.sdi.getAllRunIDs and Simulink.sdi.getRunIDByIndex.

**var** — Data to add to run

variable

Workspace data to add to the run. Simulink.sdi.addToRun supports all loading and logging data formats, including timeseries and Simulink.SimulationData.Dataset. Provide one or more var inputs when you specify 'vars' as the second argument.

Example: myData

**sourceNames** — Cell array of names for signal metadata

cell array of character vectors
Names to use as the source of the data in the metadata for the added signals. Provide a `sourceNames` input when you specify 'namevalue' as the second argument.

Example: {'speed','position'}

**dataValues** — Cell array of data to add to run  
cell array

Cell array of data to add to the run. Provide a `dataValues` input when you specify 'namevalue' as the second argument.

Example: {sig1,sig2}

**Output Arguments**

**sigIDs** — Matrix containing signal IDs for added signals  
matrix

Matrix of signal IDs for signals added to the run.

**Topics**

“Inspect and Compare Data Programmatically”

**Introduced in R2011b**
Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

Syntax

Simulink.sdi.cleanupWorkerResources

Description

Simulink.sdi.cleanupWorkerResources removes redundant data from each parallel worker repository file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model slexAircraftExample with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

% Make sure the Simulation Data Inspector is empty, and PCT support is enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
**Initialize Parallel Workers**

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an spmd code block, load the slexAircraftExample model and select signals to log. To avoid data concurrency issues using sim in parfor, create a temporary directory for each worker to use during simulations.

```matlab
p = gcp;
Starting parallel pool (parpool) using the 'local' profile ... connected to 4 workers.
spmd

% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
end

**Run Parallel Simulations**

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the Simulation Data Inspector. After the parfor loop, use another spmd segment to remove the temporary directories from the workers.

```matlab
parfor index = 1:7

% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
```
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
end

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end

ds(1)

ans = Simulink.SimulationData.Dataset '' with 2 elements

<table>
<thead>
<tr>
<th>Name</th>
<th>BlockPath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 [1x1 Signal]</td>
<td>alpha, rad ...rcraftExample/Aircraft Dynamics Model</td>
</tr>
<tr>
<td>2 [1x1 Signal]</td>
<td>Stick slexAircraftExample/Pilot</td>
</tr>
</tbody>
</table>

- Use braces {} to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
end

datasetRef(1)

ans =
    DatasetRef with properties:
        Name: 'Run 3: slexAircraftExample'
        Run: [1x1 Simulink.sdi.Run]
    numElements: 2

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```matlab
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

`Simulink.sdi.cleanupWorkerResources`

`Simulink.sdi.WorkerRun` | `Simulink.sdi.isPCTSupportEnabled`

Topics

“Inspect and Compare Data Programmatically”
Introduced in R2017b
Simulink.sdi.clear

**Package:** Simulink.sdi

Clear all data from the Simulation Data Inspector

**Syntax**

Simulink.sdi.clear

**Description**

Simulink.sdi.clear clears all plotted signals and deletes all data from the Simulation Data Inspector. The Simulink.sdi.clear function does not affect preferences or settings you have configured in the Simulation Data Inspector. Use the Simulink.sdi.clearPreferences function to reset the Simulation Data Inspector preferences to their default values. Use the Simulink.sdi.clearAllSubPlots function to clear all plotted signals without deleting any data from the Simulation Data Inspector.

**Examples**

**Save a Simulation Data Inspector Session**

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.
Create Simulation Data

This example logs the Stick, alpha, rad, and q, rad/sec signals to generate simulation data using the model slexAircraftExample and creates two runs. The first uses a sine input, and the second has a square wave input.

% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear

% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);
sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);
squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);

**Create Plots in the Simulation Data Inspector**

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.

```
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)
```

**Save a Simulation Data Inspector Session**

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

```
% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')
```

**Load a Simulation Data Inspector Session**

First, clear the Simulation Data Inspector repository with Simulink.sdi.clear and reset visualization settings with Simulink.sdi.clearPreferences. Then, you can load the session to see how the data and settings are preserved.

```
% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences
```
% Load session file to view data
Simulink.sdi.load('myData.mldatx');

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.clearAllSubPlots

Clear plotted signals from all subplots in the Simulation Data Inspector

Syntax

Simulink.sdi.clearAllSubPlots

Description

Simulink.sdi.clearAllSubPlots clears plotted signals from all subplots in the Simulation Data Inspector, including any subplots with plotted data that are not visible in the current layout. Clearing plotted signals using the Simulink.sdi.clearAllSubPlots function does not delete data from the Simulation Data Inspector. To clear plotted signals and delete data from the Simulation Data Inspector, use the Simulink.sdi.clear function.

Examples

Clear Plotted Signals from All Subplots

You can programmatically clear plotted signals from all subplots in the Simulation Data Inspector. For example, clear plotted data at the start of a script that creates plots.

Simulink.sdi.clearAllSubPlots

Plot Signals from a Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that you can use to plot the data.
Create a Simulation Run and Access the Run Object

The sldemo_fuelsys model includes several signals that are marked for logging. To create a simulation run containing the logged data, simulate the model.

\[ \text{sim('ex_vdp');} \]

The Simulation Data Inspector keeps track of runs by assigning each run created by simulation, importing data, or opening a session a unique numeric ID. To access the run object for the simulation just performed, use the \texttt{Simulink.sdi.getAllRunIDs} function and take the last run ID in the returned vector.

\[ \text{runIDs} = \text{Simulink.sdi.getAllRunIDs;} \]
\[ \text{runID} = \text{runIDs(end);} \]

Once you have the run ID for the run of interest, you can use the \texttt{Simulink.sdi.getRun} function to get the \texttt{Simulink.sdi.Run} object corresponding to the run. You can use the \texttt{Run} object to check metadata associated with the run, including the number of signals in the run.

\[ \text{vdpRun} = \text{Simulink.sdi.getRun(runID);} \]
\[ \text{vdpRun.SignalCount} \]
\[ \text{ans} = \text{int32} \]
\[ 2 \]

Plot Data Using Signal Objects

Use the \texttt{getSignalByIndex} function to access signals of interest from the Run object, \texttt{fuelRun}.

\[ \text{signal1} = \text{getSignalByIndex(vdpRun,1);} \]
\[ \text{signal2} = \text{getSignalByIndex(vdpRun,2);} \]

Use the \texttt{Simulink.sdi.setSubPlotLayout} function to specify a 3-by-1 layout.

\[ \text{Simulink.sdi.setSubPlotLayout(2,1);} \]

Before plotting the data, use the \texttt{Simulink.sdi.clearAllSubPlots} function to clear any data that is already plotted.

\[ \text{Simulink.sdi.clearAllSubPlots} \]
Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```matlab
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

**View the Plotted Data**

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

plotOnSubPlot

Topics

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.clearPreferences

Return Simulation Data Inspector preferences to default settings

Syntax

Simulink.sdi.clearPreferences

Description

Simulink.sdi.clearPreferences reverts all Simulation Data Inspector preferences to their default values.

You can configure these preferences in the Simulation Data Inspector programmatically:

- Preferences:
  - Run naming rule — Simulink.sdi.setRunNamingRule
  - Subplot layout — Simulink.sdi.setSubPlotLayout
  - Signal grouping within a run — Simulink.sdi.setTableGrouping
- Time plot settings:
  - Border display — Simulink.sdi.setBorderOn
  - Grid display — Simulink.sdi.setGridOn
  - Data markers display — Simulink.sdi.setMarkersOn
  - Tick mark labels display — Simulink.sdi.setTickLabelsDisplay
  - Tick mark position — Simulink.sdi.setTicksPosition
- Archive preferences:
  - Archive behavior — Simulink.sdi.setAutoArchiveMode
  - Archive size limit — Simulink.sdi.setArchiveRunLimit
Examples

Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically using the `Simulink.sdi.clearPreferences` function.

`Simulink.sdi.clearPreferences`

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run’s name, restore default preferences, and check the run naming rule.

```matlab
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')</n
% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

Topics
“Inspect and Compare Data Programmatically”
“Organize Your Simulation Data Inspector Workspace”

Introduced in R2017a
Simulink.sdi.close

Package: Simulink.sdi

Close the Simulation Data Inspector

Syntax

Simulink.sdi.close
Simulink.sdi.close('filename')

Description

Simulink.sdi.close closes the Simulation Data Inspector.

Simulink.sdi.close('filename') closes the Simulation Data Inspector and saves the data in the file, filename.

Examples

Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

Simulink.sdi.close

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.
Create Data for the Run

This example creates timeseries objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```matlab
% Generate timeseries data
time = linspace(0, 20, 100);
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```matlab
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```matlab
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view

Close the Simulation Data Inspector and Save Your Data
Simulink.sdi.close('sinusoids.mat')

Topics
“Inspect and Compare Data Programmatically”
“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2013b
Simulink.sdi.compareRuns

Package: Simulink.sdi

Compare the data in two simulation runs

Syntax

diffResult = Simulink.sdi.compareRuns(runID1,runID2)
diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value)

Description

diffResult = Simulink.sdi.compareRuns(runID1,runID2) compares the data in the runs corresponding to runID1 and runID2, returning the result in the Simulink.sdi.DiffRunResult object, diffResult.

diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name,Value) compares the simulation runs corresponding to runID1 and runID2 using the options specified by one or more Name,Value pair arguments and returns the comparison result in the Simulink.sdi.DiffRunResult object, diffResult. For more information about how the Simulation Data Inspector aligns signals for comparison, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Simulation Data Inspector Runs Programmatically

This example shows how to compare runs of simulation data and analyze the comparison results with the Simulation Data Inspector programmatic interface.

Generate Runs of Simulation Data

Simulate the model with different Desired relative slip values to create runs of simulation data to analyze with the Simulation Data Inspector programmatic interface.
% Open model
load_system('ex_sldemo_absbrake')

% Set the desired slip ratio to 0.24 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
out_1 = sim('ex_sldemo_absbrake');

% Change the desired slip ratio to 0.25 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
out_2 = sim('ex_sldemo_absbrake');

**Compare Runs with a Global Tolerance**

Get the run IDs for the runs you just created with the `Simulink.sdi.getAllRunIDs` function. Then, compare the runs using a global relative tolerance and a global time tolerance to analyze whether your data meets specifications.

% Get run IDs for last two runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
runResult = Simulink.sdi.compareRuns(runID1,runID2,'reltol',0.2,'timetol',0.5);

**Create a Plot of a Comparison Result**

Use the `Simulink.sdi.DiffRunResult` object you created in the previous step with `Simulink.sdi.compareRuns` to access the data for the Ww signal result to plot it in a figure.

% Plot the |Ww| signal difference
signalResult_Ww = getResultByIndex(runResult,1);
figure(1)
plot(signalResult_Ww.Diff)
Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the slexAircraftExample model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the q, rad/sec and alpha, rad signals for logging. Then, simulate the model to create the baseline run.
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate system
out_1 = sim('slexAircraftExample');

**Modify Model Parameter**
Modify the model parameter Ts in the model workspace to change the time constant of
the input low-pass filter.

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',1)

% Simulate again
out_2 = sim('slexAircraftExample');

**Compare Runs and Inspect Results**
Use the Simulink.sdi.compareRuns function to compare the data from the simulations. Then, inspect the match property of the signal result to see whether the signals fell within the default tolerance of 0.

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = getResultByIndex(diffRun1,1);
sig2Result1 = getResultByIndex(diffRun1,2);

% Check whether signals matched
sig1Result1.Status
ans =
OutOfTolerance
sig2Result1.Status
ans =
OutOfRange

**Compare Runs with Signal Tolerances**

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run1,2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = getResultByIndex(diffRun2,1);
sig2Result2 = getResultByIndex(diffRun2,2);

% Check the result
sig1Result2.Status
ans =
WithinTolerance

sig2Result2.Status
ans =
WithinTolerance
**Compare Runs with Alignment Criteria**

This example shows how to compare runs using your desired criteria for aligning signals between runs.

**Generate Simulation Data to Compare**

Start by loading the `slexAircraftExample` system and marking signals of interest for logging.

```matlab
% Load the model slexAircraftExample
load_system('slexAircraftExample')

% Mark signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

This example runs two simulations of the `slexAircraftExample` model with different values of the variable `Ts`. Use `get_param` to access the model workspace for the `slexAircraftExample` model. Then, assign a value for the variable and run the first simulation.

```matlab
% Get the model workspace and set the value of variable Ts
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',0.1);

% Configure model "slexAircraftExample" for logging and simulate
out_1 = sim('slexAircraftExample');
```

Change the value of `Ts` and run the second simulation. Then, use the Simulation Data Inspector programmatic interface to access the run IDs for the two simulation runs.

```matlab
% Modify the value of model workspace variable Ts
modelWorkspace.assignin('Ts',0.2);

% Simulate again with the new value of Ts
out_2 = sim('slexAircraftExample');

% Get run IDs for simulations
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);
```
Define Alignment Criteria for the Comparison

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```matlab
% Define the alignment criteria for the comparison to align signals by
% name, then by block path, then by SID
alignMethods = [Simulink.sdi.AlignType.SignalName
                Simulink.sdi.AlignType.BlockPath
                Simulink.sdi.AlignType.SID];
```

Compare the Runs with the Specified Alignment Criteria

Compare the simulation data in your two runs, using the alignment criteria you specified. The comparison uses a small time tolerance to account for the effect of differences in the step size used by the solver on the transition of the square wave input.

```matlab
% Compare the runs
diffResults = Simulink.sdi.compareRuns(runID1,runID2,'align',alignMethods,...
    'timetol',0.005);
```

Check the Comparison Results for the Aligned Signals

You can use the `getResultByIndex` method to access the comparison results for the aligned signals in the runs you compared.

```matlab
% Check the number of comparisons in the result
numComparisons = diffResults.count;

% Display result for each signal in command window
for k = 1:numComparisons
    resultAtIdx = diffResults.getResultByIndex(k);

    % Get signal IDs for each comparison result
    sigID1 = resultAtIdx.signalID1;
    sigID2 = resultAtIdx.signalID2;

    sig1 = Simulink.sdi.getSignal(sigID1);
    sig2 = Simulink.sdi.getSignal(sigID2);

    % Display whether signals match
    displayStr = 'Signals %s and %s: %s
' ;
```
fprintf(displayStr,sig1.Name,sig2.Name,resultAtIdx.Status);

end

Signals alpha, rad and alpha, rad: OutOfTolerance
Signals Stick and Stick: WithinTolerance

**Input Arguments**

**runID1** — Baseline run identifier  
integer

Numerical identification for the **Baseline** run in the comparison.

**runID2** — Compare to run identifier  
integer

Numerical identification for the **Compare to** run in the comparison.

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of **Name**, **Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as  **Name1,** **Value1,**..., **NameN,** **ValueN.**

Example: `'abstol',x,'align',alignOpts`

**align** — Signal alignment options
array

Array specifying alignment algorithms to use for pairing signals from the runs for comparison. The Simulation Data Inspector aligns signals first by the first element in the array, then by the second element in the array, and so on.

<table>
<thead>
<tr>
<th>Value</th>
<th>Aligns By</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Simulink.sdi.AlignType.BlockPath</code></td>
<td>Path to the signal's source block</td>
</tr>
<tr>
<td><code>Simulink.sdi.AlignType.SID</code></td>
<td>Simulink identifier “Locate Diagram Components Using Simulink Identifiers”</td>
</tr>
<tr>
<td><code>Simulink.sdi.AlignType.SignalName</code></td>
<td>Signal name</td>
</tr>
<tr>
<td>Value</td>
<td>Aligns By</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>Simulink.sdi.AlignType.DataSource</td>
<td>Path of the variable in the MATLAB workspace</td>
</tr>
</tbody>
</table>

Example:

```markdown
[Simulink.sdi.AlignType.SignalName, Simulink.sdi.AlignType.SID]
```

specifies signal alignment by name and then by SID.

**abstol — Absolute tolerance for comparison**

0 (default) | scalar

Positive-valued global absolute tolerance used for all signals in the run comparison. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: 0.5

Data Types: double

**reltol — Relative tolerance for comparison**

0 (default) | scalar

Positive-valued global relative tolerance used for all signals in the run comparison. The relative tolerance is expressed as a fractional multiplier. For example, 0.1 specifies a 10 percent tolerance. For more information about how the relative tolerance is applied in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: 0.1

Data Types: double

**timetol — Time tolerance for comparison**

0 (default) | scalar

Positive-valued global time tolerance used for all signals in the run comparison. Specify the time tolerance with units of seconds. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: 0.2

Data Types: double
Output Arguments

diffResult — Comparison results
'Simulink.sdi.diffRunResult'

Simulink.sdi.DiffRunResult object that provides access to comparison results.

Topics
“Inspect and Compare Data Programmatically”
“Compare Simulation Data”
“How the Simulation Data Inspector Compares Data”

Introduced in R2011b
Simulink.sdi.compareSignals

Package: Simulink.sdi

Compare data from two signals

Syntax

diff = Simulink.sdi.compareSignals(sigID1,sigID2)

Description

diff = Simulink.sdi.compareSignals(sigID1,sigID2) compares the signals corresponding to the signal IDs sigID1 and sigID2 and returns the results in a Simulink.sdi.DiffSignalResult object. For more information on how the comparison results are computed, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Signals Within a Simulation Run

This example uses the slexAircraftExample model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate model slexAircraftExample
out = sim('slexAircraftExample');
% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = getSignalIDByIndex(aircraftRun,1);
signalID2 = getSignalIDByIndex(aircraftRun,2);

if (isValidSignalID(aircraftRun,signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (isValidSignalID(aircraftRun,signalID1) && isValidSignalID(aircraftRun,signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signal result status
    match = sigDiff.Status
end

match = OutOfTolerance

**Compare Signals from Different Runs**

This example shows how to compare signals from different simulation runs using the Simulation Data Inspector's Simulink.sdi.compareSignals function. When you only have one signal of interest to compare, using a signal comparison returns the Simulink.sdi.diffSignalResult object with the comparison data directly.

**Generate Simulation Data**

Use the slexAircraftExample model to generate simulation runs. Between the runs, change the time constant of the input filter.

% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate system
out_1 = sim('slexAircraftExample');

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',0.2)

% Simulate again
out_2 = sim('slexAircraftExample');

Get Signal IDs for the Signal Comparison

Create run objects using the run IDs, and then use getSignalIDByIndex to get the signal IDs to pass to Simulink.sdi.compareSignals.

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run2,1);

Compare Signals

Compare the signals, and open the Simulation Data Inspector to view the results.

diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
Simulink.sdi.view

Input Arguments

sigID1 — Signal ID of Baseline signal
scalar
Signal ID for the **Baseline** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a Simulink.sdi.Run object with the `getSignalIDByIndex` method.

**sigID2 — Signal ID of Compare to signal**

scalar

Signal ID for the **Compare to** signal. The Simulation Data Inspector assigns signal and run IDs when you create a run for your data. You can access the signal ID from a Simulink.sdi.Run object with the `getSignalIDByIndex` method.

**Output Arguments**

**diff — Comparison results**

'Simulink.sdi.diffSignalResult'

Simulink.sdi.DiffSignalResult object containing the results of the signal comparison.

**See Also**

Simulink.sdi.DiffSignalResult | Simulink.sdi.Run | Simulink.sdi.compareRuns

**Topics**

“Inspect and Compare Data Programmatically”

“Compare Simulation Data”

“How the Simulation Data Inspector Compares Data”

**Introduced in R2011b**
Simulink.sdi.copyRun

Copy a Simulation Data Inspector run

**Syntax**

```matlab
newRunID = Simulink.sdi.copyRun(runID)
[newRunID,runIndex] = Simulink.sdi.copyRun(runID)
[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

**Description**

`newRunID = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID for the new run. The new run includes all the simulation data and metadata from the original run. You can modify the copy of the run by adding or deleting signals and metadata while still retaining the original run.

`[newRunID,runIndex] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID and index in the Simulation Data Inspector repository for the new run. The new run includes all the simulation data and metadata from the original run.

`[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the signal IDs for the signals in the new run along with its run ID and index in the Simulation Data Inspector repository. The new run includes all the simulation data and metadata from the original run.

**Examples**

**Compare a Subset of Signals**

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a
subset of signals while still holding onto the original run that has all of the signals. For example, the model sldemo_fuelsys is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

**Create Runs**

Load the model sldemo_fuelsys and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor:

```matlab
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')
modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

**Copy the Run**

Use the Simulation Data Inspector's programmatic interface to get Simulink.sdi.Run objects for the simulations, and then create copies of the runs.

```matlab
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);
run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

**Delete Signals in Run Copy**

The sldemo_fuelsys model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's
response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))

**Compare Truncated Runs**

You can use the truncated runs you created with Simulink.sdi.copyRun and Simulink.sdi.deleteSignal to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

truncRunDiff = Simulink.sdi.compareRuns(truncRun1, truncRun2);

Simulink.sdi.view

**Input Arguments**

**runID** — Numeric run identifier
 scalar

Run ID for the run you want to copy. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using Simulink.sdi.getAllRunIDs or Simulink.sdi.getRunIDByIndex.

**Output Arguments**

**newRunID** — Run ID for the copy
 scalar

Run ID for the copy of the run.
runIndex — Run index for the copy
scalar

Index of the copy in the Simulation Data Inspector repository.

signalIDs — Numeric identifiers for the signals in the copy
matrix

Matrix containing the signal IDs for the copies of signals created in the copy of the run.

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.copyRunViewSettings

Copy line style and color for signals from one run to another

**Syntax**

\[ \text{sigIDs} = \text{Simulink.sdi.copyRunViewSettings}(\text{run1}, \text{run2}, \text{plot}) \]

**Description**

\[ \text{sigIDs} = \text{Simulink.sdi.copyRunViewSettings}(\text{run1}, \text{run2}, \text{plot}) \] copies the line style and color specifications from \( \text{runID1} \) to \( \text{runID2} \) for matched signals. You can specify \( \text{run1} \) and \( \text{run2} \) with their run ID or as a Simulink.sdi.Run object. If \( \text{plot} \) is specified as true, Simulink.sdi.copyRunViewSettings also changes signal parameters in both runs so that aligned signals that are plotted come from the \( \text{run2} \). The function returns an array of signal identifiers for the signals that the Simulation Data Inspector aligned between the two runs. To learn more about how the Simulation Data Inspector aligns signals between runs, see “How the Simulation Data Inspector Compares Data”.

**Examples**

**Copy View Settings to a Run**

This example shows how to copy view settings from one run to another and how to create figures using the Simulink.sdi.CustomSnapshot object.

**Simulate Your Model and Get a Run Object**

Configure the \( \text{vdp} \) model to save output data, and run a simulation to create data.

```matlab
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```
Use the Simulation Data Inspector programmatic interface to access the run data.

```matlab
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

**Modify Signal View Settings**

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```matlab
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

**Capture a Snapshot from the Simulation Data Inspector**

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```matlab
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```matlab
snap.Rows = 2;
snap.YRange = {{-2.25 2.25}, [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```matlab
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```
Copy the View Settings to a New Simulation Run

Simulate the model again, with a different \( \mu \) value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```MATLAB
set_param('vdp/Mu','Gain','5')
sim('vdp');
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using
Simulink.sdi.copyRunViewSettings. The Simulink.sdi.copyRunViewSettings function does not automatically update plot settings in Simulink.sdi.CustomSnapshot objects, so specify the plot input as false.

\[
sigIDs = \text{Simulink.sdi.copyRunViewSettings}(\text{runID}, \text{runID2}, \text{false});
\]

**Capture a Snapshot of the New Simulation Run**

Use the Simulink.sdi.CustomSnapshot object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

\[
\begin{align*}
\text{snap.clearSignals} \\
\text{snap.YRange} &= \{[-2.25 \ 2.25], [-8 \ 8]\}; \\
\text{snap.plotOnSubPlot}(1,1,\text{sigIDs}(1),\text{true}) \\
\text{snap.plotOnSubPlot}(2,1,\text{sigIDs}(2),\text{true}) \\
\text{fig} &= \text{snap.snapshot("to","figure"});
\end{align*}
\]
**Input Arguments**

**run1** — Simulation Data Inspector run ID for source run  
scalar | `'Simulink.sdi.Run'` object

Run with the view settings you want to copy specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

**run2** — Simulation Data Inspector run ID for destination run  
scalar | `'Simulink.sdi.Run'` object
Run you want to copy the view settings to, specified with its run ID or Simulink.sdi.Run object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using Simulink.sdi.getAllRunIDs or Simulink.sdi.getRunIDByIndex.

plot — Specify whether to update plotted signals
true | false

Specifies whether the Simulation Data Inspector changes the plot settings in the runs corresponding to run1 and run2.

- When plot is true, the Simulation Data Inspector modifies the signal parameters so that the aligned signals that are plotted come from run2.
- When plot is false, the Simulation Data Inspector does not change which signals are plotted.

Data Types: logical

Output Arguments

sigIDs — Signal IDs for aligned signals
matrix

Matrix containing the signal IDs for signals in run2 that aligned with signals in run1 and had view settings modified.

Topics

“Inspect and Compare Data Programmatically”
“Create Plots Using the Simulation Data Inspector”

Introduced in R2016a
Simulink.sdi.createRun

**Package:** Simulink.sdi

Create a run in the Simulation Data Inspector

**Syntax**

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(runName)
runID = Simulink.sdi.createRun(var)
runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)
runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames, sigValues)
runID = Simulink.sdi.createRun(runName,'file',filename)
```

```
[runID,runIndex] = Simulink.sdi.createRun(____)
[runID,runIndex,signalIDs] = Simulink.sdi.createRun(____)
```

**Description**

`runID = Simulink.sdi.createRun` creates an empty, unnamed run in the Simulation Data Inspector repository and returns the run ID. You can use `Simulink.sdi.getRun` to get a `Simulink.sdi.Run` object for the run, which allows you to add metadata and signals to the run.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName`.

`runID = Simulink.sdi.createRun(var)` creates a run named `var` containing the data in the workspace variable `var`.

`runID = Simulink.sdi.createRun(runName,'vars',var,var2,...,varn)` creates a run named `runName` containing data from one or more variables in the base workspace. The signals in the run take their names from the variable names.
runID = Simulink.sdi.createRun(runName,'namevalue',sourceNames, sigValues) creates a run named runName with the data in the cell array sigValues. The cell array of sourceNames specifies names to use as the source for the sigValues data.

runID = Simulink.sdi.createRun(runName,'file',filename) creates a run with data from the MAT, CSV, MDF, or Microsoft Excel file specified by filename.

[runID,runIndex] = Simulink.sdi.createRun( ___ ) returns the run ID and run index for the run created in the Simulation Data Inspector repository.

[runID,runIndex,signalIDs] = Simulink.sdi.createRun( ___ ) returns the run ID, run index within the Simulation Data Inspector, and the signal IDs for the signals in the run.

Examples

Create a Run in the Simulation Data Inspector

This example shows several ways to create a run in the Simulation Data Inspector for your data. You can create a run from simulation outputs, workspace data, and from a file.

Create Data

You can create Simulation Data Inspector runs from workspace data or from a file. The namevalue syntax for Simulink.sdi.createRun can be useful for hierarchical data. Create example data to use in each scenario.

% Create timeseries workspace data
time = linspace(0,20,101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';

% Create Dataset workspace data
```matlab
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = sinusoids_ds.add(cos_ts);
sinusoids_ds = sinusoids_ds.add(sine_ts);

doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = doubSinusoids_ds.add(doubSine);
doubSinusoids_ds = doubSinusoids_ds.add(doubCos);

% Save workspace data to a MAT-file
save sinusoids.mat sine_ts cos_ts

Create a Run with a Run Object

You can create a run object using the Simulink.sdi.Run object's create method and then add data to the run using the add method. The add method supports all loading and logging data formats.

% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars',sine_ts,cos_ts);

Create a Run for a Variable

When you have only one signal of interest that you want to inspect and compare in the Simulation Data Inspector you can use a simple syntax to create the run. The run takes the same name as the variable.

runID = Simulink.sdi.createRun(sine_ts);

Create a Named Empty Run

With this syntax, you can create an empty run and specify its name. Then, you can use the returned runID to add data to the run.

runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',cos_ts);
```
Create a Run from Multiple Workspace Variables

When your signals of interest are in multiple variables in your workspace, use the 'vars' syntax. You can also use this syntax to provide a custom name for a run created from a single variable.

```matlab
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

Create a Run and Specify the Source for the Data

Providing a name for the source of the run data can be helpful, particularly with hierarchical data. Use the 'namevalue' syntax to specify data source names.

```matlab
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids','BigSinusoids'},[sinusoids_ds,doubSinusoids_ds]);
```

Create a Run from Data in a File

You can create a run in the Simulation Data Inspector directly from a file of data using the 'file' syntax.

```matlab
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

View Runs in the Simulation Data Inspector

Look at the runs in the Inspect pane to see the results from each run creation method. You can select a run or a signal to view its metadata.

```matlab
Simulink.sdi.view
```

Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```matlab
% Create timeseries workspace data
time = linspace(0, 20, 101);
sine_vals = sin(2*pi/5*time);
```
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';

Create a Run and Return Signal IDs

You can use the Simulink.sdi.createRun syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a Simulink.sdi.Run object.

[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',
    sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);

Modify Signal Properties and View in the Simulation Data Inspector

You can use the Simulink.sdi.Signal object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view

Input Arguments

runName — Name for the run
character vector

Name for the run in the Simulation Data Inspector.

Example: 'Baseline Simulation'

var — Variable name
variable

Variable in the base workspace containing the data you want to create a run for in the Simulation Data Inspector. The Simulation Data Inspector requires an associated time
vector for your data. Simulink.sdi.createRun supports all loading and logging data formats, including timeseries and Simulink.SimulationData.Dataset.

Provide one var argument when var is the only argument and one or more var arguments when you specify 'vars' for the second argument.

Example: myData

**sourceNames — Cell array of signal names**
cell array

Cell array of character vectors in which each element is the name of the source for data in the run. Provide a sigNames input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

**sigValues — Signal data**
cell array

Cell array of variables containing signal data for the run. Provide a sigValues input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

**filename — Name of file containing data for run**
character vector

File name of the file containing your run data. Provide a filename input when you specify 'file' for the second argument. You can create a run from a MAT, CSV, or Microsoft Excel file. You can also create a run from an MDF-file with an mdf, mf4, mf3, data, or dat file extension.

Example: 'simulation.mat'

### Output Arguments

**runID — Run identifier**
scalar

Run identifier for the new run.
runIndex — Run index
scalar

Index of the new run in the Simulation Data Inspector repository.

signalIDs — Signal IDs for signals in run
vector

Vector containing the signal IDs for the signals in the run.

Simulink.sdi.Run | Simulink.sdi.addToRun | Simulink.sdi.copyRun |
Simulink.sdi.createRunOrAddToStreamedRun | Simulink.sdi.deleteRun |
Simulink.sdi.getRun

Topics
“Inspect and Compare Data Programmatically”
“View Data with the Simulation Data Inspector”

Introduced in R2011b
Simulink.sdi.createRunOrAddToStreamedRun

**Package:** Simulink.sdi

Create a single run for all simulation outputs

**Syntax**

```matlab
runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName,varSources,varValues)
```

**Description**

`runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl,runName,varSources,varValues)` creates a run with the data `varValues` if no run exists in the Simulation Data Inspector repository for the model `mdl`. If one or more runs for the model `mdl` exist in the Simulation Data Inspector repository, the function adds `varValues` to the most recent run associated with `mdl`. The run is named according to `runName`, and the sources for the data in `varValues` are named according to `varSources`.

**Examples**

**Add Signals to a Run**

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add logged states data to the run created through simulation.

**Simulate the Model**

Simulate the model to generate data. The model `slexAircraftExample` is configured to log outputs, so the Simulation Data Inspector automatically creates a run with the logged outport data. Using this simulation syntax, `out` contains the outport data (`yout`) and the states data (`xout`).
load_system('slexAircraftExample')
out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
'SaveFormat','Dataset');

**Add Logged States Data to Run**

The Simulation Data Inspector automatically created a run for the logged outport data. Add the logged state data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```matlab
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
{'out'},{out});
```

**Open the Simulation Data Inspector to View Results**

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. Using `Simulink.sdi.createRun` to bring the states data into the Simulation Data Inspector creates a second run. `Simulink.sdi.addToRun` creates a duplicate signal from the outport data. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

```matlab
Simulink.sdi.view
```

**Input Arguments**

- `mdl` — Name of model that created simulation data  
  character vector

  Name of the model the simulation data is from, specified as a character vector.

  Example: `'sldemo_absbrake'`

- `runName` — Name for the run  
  character vector

  Name for the new or augmented run. If `Simulink.sdi.createRunOrAddToStreamedRun` adds data to an existing run, the run is renamed according to `runName`.

  Example: `'Run 1'`
varSources — Names to use for the sources of data
cell array of character vectors

Names for the sources of the data in varValues.
Example: {'sig1','sig2'}

varValues — Data to add to run
cell array

Cell array of data to incorporate into the run.
Simulink.sdi.createRunOrAddToStreamedRun supports data in all logging and loading formats, including timeseries and Simulink.SimulationData.Dataset.
Example: {sig1,sig2}

Output Arguments

runID — Run identifier
scalar

Run identifier for the new or augmented run.

Introduced in R2017a
Simulink.sdi.deleteRun

Package: Simulink.sdi

Delete a run from the Simulation Data Inspector repository

Syntax

Simulink.sdi.deleteRun(runID)

Description

Simulink.sdi.deleteRun(runID) deletes the run corresponding to runID. When you delete a run, the indices of all runs following the deleted run change to account for the change in the run count. Deleting a run does not change any run IDs.

Examples

Delete a Run

You can delete a run from the Simulation Data Inspector repository to free up memory space or to declutter your workspace from data you do not need.

% Load and simulate sldemo_fuelsys model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get the run ID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
% Delete the run
Simulink.sdi.deleteRun(runID)

Input Arguments

runID — Run identifier
calar

Run ID for the run you want to delete. You can get the run ID for a run using Simulink.sdi.getAllRunIDs or Simulink.sdi.getRunIDByIndex.

See Also

Simulink.sdi.clear | Simulink.sdi.copyRun | Simulink.sdi.deleteSignal | Simulink.sdi.getAllRunIDs | Simulink.sdi.getArchiveRunLimit | Simulink.sdi.getRunIDByIndex | Simulink.sdi.setArchiveRunLimit

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.deleteSignal

**Package:** Simulink.sdi

Delete a signal from the Simulation Data Inspector repository

**Syntax**

Simulink.sdi.deleteSignal(sigID)

**Description**

Simulink.sdi.deleteSignal(sigID) deletes the signal corresponding to sigID from the Simulation Data Inspector repository.

**Examples**

**Compare a Subset of Signals**

This example shows how to use Simulink.sdi.copyRun and Simulink.sdi.deleteSignal to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model sldemo_fuelsys is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

**Create Runs**

Load the model sldemo_fuelsys and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')
modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')

Copy the Run

Use the Simulation Data Inspector's programmatic interface to get Simulink.sdi.Run objects for the simulations, and then create copies of the runs.

% Get runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);
run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);

Delete Signals in Run Copy

The sldemo_fuelsys model is configured to log the values of the fault switches along with several signals representing the system’s response. When you compare the system’s response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))
Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))

Compare Truncated Runs

You can use the truncated runs you created with Simulink.sdi.copyRun and Simulink.sdi.deleteSignal to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);
Simulink.sdi.view

Input Arguments

sigID — Signal ID
scalar

Unique number identifying the signal within the Simulation Data Inspector repository. You can get the signal ID for a signal as a return from Simulink.sdi.createRun or using the Simulink.sdi.Run object's methods.

See Also
Simulink.sdi.Run | Simulink.sdi.Signal | Simulink.sdi.copyRun | Simulink.sdi.createRun

Topics
“Inspect and Compare Data Programmatically”
“Organize Your Simulation Data Inspector Workspace”

Introduced in R2016a
Simulink.sdi.enablePCTSupport

Control how the Simulation Data Inspector works with the Parallel Computing Toolbox

Syntax

Simulink.sdi.enablePCTSupport(mode)

Description

Simulink.sdi.enablePCTSupport(mode) enables support for automatic data import from parallel workers into the Simulation Data Inspector, according to the mode specified by mode. You can configure the Simulation Data Inspector to import no worker data, only data from local workers, or data from all workers — local and remote. You can also configure the parallel worker support as manual, where you manually select runs to import to the Simulation Data Inspector using the Simulink.sdi.sendWorkerRunToClient function. By default, the Simulation Data Inspector automatically imports runs from local workers.

Examples

Enable Parallel Support for All Workers

Configure Simulation Data Inspector parallel worker support to import the output automatically from both local and remote workers.

Simulink.sdi.enablePCTSupport('all')

Disable Support for Parallel Workers

To prevent the output from any Parallel Computing Toolbox workers from automatically importing to the Simulation Data Inspector, disable Parallel Computing Toolbox support.
Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use Simulink.sdi.sendWorkerRunToClient to send runs created using parallel workers manually to the Simulation Data Inspector.

Setup

This example runs several simulations of the vdp model, varying the value of the gain, Mu. To set up for the parallel simulation, define a vector of Mu values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```matlab
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');

% Choose several Mu values
MuVals = [1 2 3 4];
```

Initialize Parallel Workers

Use parpool to start a pool of four parallel workers. This example calls parpool inside an if statement so you only create a parallel pool if you don't already have one. You can use spmd to run initialization code common to all workers. For example, load the vdp model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with sim in parfor, create a temporary directory on each worker. After the simulations complete, another spmd block deletes the temporary directories.

```matlab
p = gcp('nocreate');
if isempty(p)
    parpool(4);
end
```

Starting parallel pool (parpool) using the 'local' profile ... connected to 4 workers.

```matlab
spmd
```
% Load system and select signals to log
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1', 1, 'on')
Simulink.sdi.markSignalForStreaming('vdp/x2', 1, 'on')

% Create temporary directory for simulation on worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
set(workDir, 'ParentFolder', tempDir)
cd(tempDir)

end

Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using parfor. Each worker runs a vdp simulation with a different value of Mu. Simulink cannot access the contents of the parfor loop, so the variable MuVal is defined in the worker's workspace, where the vdp model can see it, using assignin.

parfor (index = 1:4)
    % Set value of Mu in the worker's base workspace
    assignin('base', 'MuVal', MuVals(index));
    % Modify the value of Mu in the model and simulate
    set_param('vdp/Mu', 'Gain', 'MuVal')
    sim('vdp')
end

Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a Simulink.sdi.Run object and attaches the value of Mu used in the simulation with the Tag property.

% Attach metadata to the run
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
parRun = Simulink.sdi.getRun(runID);
parRun.Tag = strcat('Mu = ', num2str(MuVals(index)));

% Send the run to the Simulation Data Inspector on the client MATLAB
Simulink.sdi.sendWorkerRunToClient

end

Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```matlab
spmd
    % Remove temporary directories
    cd(workDir)
    rmdir(tempDir, 's')
    rmpath(workDir)
end

Simulink.sdi.view
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```matlab
% Make sure the Simulation Data Inspector is empty, and PCT support is % enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

Initialize Parallel Workers

Use gcp to create a pool of local workers to run parallel simulations if you don't already have one. In an spmd code block, load the slexAircraftExample model and select signals to log. To avoid data concurrency issues using sim in parfor, create a temporary directory for each worker to use during simulations.

p = gcp;
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.

spmd

% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
end

Run Parallel Simulations

Use parfor to run the seven simulations in parallel. Select the value for Ts for each simulation, and modify the value of Ts in the model workspace. Then, run the simulation and build an array of Simulink.sdi.WorkerRun objects to access the data with the Simulation Data Inspector. After the parfor loop, use another spmd segment to remove the temporary directories from the workers.

parfor index = 1:7

% Select value for Ts
Ts_val = Ts_vals(index);
% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
end

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset ' ' with 2 elements

<table>
<thead>
<tr>
<th>Name</th>
<th>BlockPath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[1x1 Signal] alpha, rad ...rcraftExample/Aircraft Dynamics Model</td>
</tr>
<tr>
<td>2</td>
<td>[1x1 Signal] Stick slexAircraftExample/Pilot</td>
</tr>
</tbody>
</table>

- Use braces `{ }` to access, modify, or add elements using index.
Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the getDatasetRef method to reference the data associated with the WorkerRun.

```matlab
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
```

datasetRef(1)

```matlab
ans =
    DatasetRef with properties:
        Name: 'Run 3: slexAircraftExample'
        Run: [1×1 Simulink.sdi.Run]
    numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```matlab
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.
Input Arguments

mode — Parallel worker support mode

'mode' — Parallel worker support mode

'local' (default) | 'none' | 'all' | 'manual'

Mode of Simulation Data Inspector support for importing runs from parallel workers.

- 'local' — The default behavior configures automatic import for runs generated on local workers.
- 'none' — Disables parallel worker support. No runs from local or remote workers import to the Simulation Data Inspector.
- 'all' — Enables automatic import for runs created from local and remote workers.
- 'manual' — Configures support for manual import of runs created by parallel workers using the Simulink.sdi.sendWorkerRunToClient function.

Data Types: char | string

Simulink.sdi.WorkerRun | Simulink.sdi.isPCTSupportEnabled | Simulink.sdi.sendWorkerRunToClient

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b
Simulink.sdi.exportRun

Export Simulation Data Inspector run data to the workspace or a file

Syntax

dataset = Simulink.sdi.exportRun(runID)
Simulink.sdi.exportRun(runID,Name,Value)

Description

dataset = Simulink.sdi.exportRun(runID) creates a
Simulink.SimulationData.Dataset object in the base workspace with the data in
the Simulation Data Inspector run identified by runID.

Simulink.sdi.exportRun(runID,Name,Value) exports the data in the run
corresponding to runID to the base workspace or a file according to the options specified
by one or more name-value pair arguments. You can export data for one or more runs to a
MAT, MLDATX, or Microsoft Excel file. To export data for multiple runs to a file, you can
specify the runIDs input as a vector of run IDs.

Examples

Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a
Simulink.SimulationData.Dataset object in the base workspace you can use to
further process your data. The method you choose to export your run depends on the
processing you do in your script. If you have a run object for the run, you can use the
export method to create a Simulink.SimulationData.Dataset object with the run
data in the base workspace. If you do not have a run object, use the
Simulink.sdi.exportRun function to export the run to the workspace.
Export Run Using Simulink.sdi.exportRun

Use the Simulink.sdi.export function to export run data to the workspace or a file when your workflow does not include creating a run object.

To create a run of simulation data, open the vdp model, mark signals for logging, and run a simulation.

```matlab
load_system('vdp')
SignalHandles = get_param('vdp', 'Lines');
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')
out = sim('vdp');
```

Use the Simulink.sdi.getAllRunIDs function to access the most recently created run.

```matlab
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Use the Simulink.sdi.exportRun function to export the run data to a Dataset object in the workspace.

```matlab
Simulink.sdi.exportRun(runID);
```

Export Run Using export Method

When your workflow involves creating a Run object, you can use the export function to create a Simulink.SimulationData.Dataset object in the base workspace for further processing of the run data. For example, you need to access Run objects for simulation runs with signal data you want to compare using the Simulink.sdi.compareSignals function.

Load a model and mark signals for logging. Then, simulate the model to create run data.

```matlab
load_system('vdp')
SignalHandles = get_param('vdp', 'Lines');
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')
```
sim('vdp');

Use the Simulink.sdi.getAllRunIDs function to access the run ID for the most recently created run. Then, use the Simulink.sdi.getRun function to access the Run object corresponding to the run.

runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);

Use the export function to export the run data to a Dataset object in the workspace.

simDataset = export(vdpRun);

### Input Arguments

**runID — Run identifier**

Scalar | Vector

Run identifier for the run you want to export to the workspace or a file. When you export data to a file, you can export more than one run by specifying the runID input as a vector of Simulation Data Inspector run IDs.

The Simulation Data Inspector assigns a unique run ID to each run. You can get the run ID for one or more runs using Simulink.sdi.getAllRunIDs and Simulink.sdi.getRunIDByIndex.

### Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'to', 'file'

**to — Specify where to export data**

'variable' (default) | 'file'

Specify whether to export data to a variable in the base workspace or to a file.
When you export data to a file, you must also specify a file name using the 'filename' name-value pair argument. You can specify a file name with a MAT, MLDATX, or XLSX extension.

When you export a run to a MAT-file, the data is saved in a Simulink.SimulationData.Dataset object. When you export more than one run to a MAT-file using the Simulink.sdi.exportRun function, the data is saved in a Dataset object, where each element is a Dataset object containing the data for an exported run.

Data exported to a Microsoft Excel file is saved with the format described in “Simulation Data Inspector Import and Export File Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pairs.

Example: 'to','file'

filename — Name of file to contain exported data

string

Name of the file to contain the exported data, specified as a string or character array. Include a MAT, MLDATX, or XLSX extension in the file name to specify whether to export to a MAT-file, MLDATX-file, or a Microsoft Excel file. When you do not specify an extension with the file name, the data exports to a MAT-file.

Use the 'filename' name-value pair argument when you specify the 'to' name-value pair argument with the value 'file'.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pair arguments.

Example: 'filename','mySpreadsheet.xlsx'

overwrite — Specify data to overwrite in existing Microsoft Excel file

'field' (default) | 'sheetsonly'

Specify data to overwrite in existing Microsoft Excel file. When you export data to a Microsoft Excel file that already exists, you can control whether the export overwrites the entire file or only the affected sheets in the file.

- 'file' — Overwrite the entire file with the exported data.
- 'sheetsonly' — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.
Example: 'overwrite','sheetsonly'

`metadata — Specify metadata to include in exported Microsoft Excel file [] (default) | string array`

Metadata to include in the exported Microsoft Excel file, specified in a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata does not affect the format in the exported file, which always matches the description in “Simulation Data Inspector Import and Export File Format”.

Example: 'metadata',["units","dataType"]

`sharetimecolumn — Specify whether signals share time columns in exported Microsoft Excel file 'on' (default) | 'off'`

Specify whether to share time columns in the exported Microsoft Excel file for signals that have identical time data. By default, signals with the same time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: 'sharetimecolumn','off'

**Output Arguments**

`dataset — Dataset containing run data`  
*Simulink.SimulationData.Dataset*

`Simulink.SimulationData.Dataset` object containing the data from the run identified by `runID`.

Topics
“Inspect and Compare Data Programmatically”
“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2017a
Simulink.sdi.getAllRunIDs

**Package:** Simulink.sdi

Get all Simulation Data Inspector run identifiers

**Syntax**

```matlab
runIDs = Simulink.sdi.getAllRunIDs
```

**Description**

`runIDs = Simulink.sdi.getAllRunIDs` returns a matrix of the run identifiers for all runs in the Simulation Data Inspector repository.

**Examples**

**Get Run ID for a Simulation**

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a `Simulink.sdi.Run` object to access run data and metadata, or you can use the run ID for a comparison.

**Simulate a Model to Create a Run**

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```matlab
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```
Get Run ID Using Simulink.sdi.getAllRunIDs

Simulink.sdi.getAllRunIDs returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```matlab
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use Simulink.sdi.getRunCount and Simulink.sdi.getRunIDByIndex to get the run ID for a run. This method is useful if you also want to use count as a counting variable to index through the runs in the Simulation Data Inspector repository.

```matlab
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the slexAircraftExample model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

Setup

Load the model, and mark the q, rad/sec and alpha, rad signals for logging. Then, simulate the model to create the baseline run.

```matlab
% Load example model
load_system('slexAircraftExample')

% Mark the q, rad/sec and alpha, rad signals for logging
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate system
out_1 = sim('slexAircraftExample');
```

Modify Model Parameter

Modify the model parameter Ts in the model workspace to change the time constant of the input low-pass filter.
% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',1)

% Simulate again
out_2 = sim('slexAircraftExample');

**Compare Runs and Inspect Results**

Use the Simulink.sdi.compareRuns function to compare the data from the simulations. Then, inspect the match property of the signal result to see whether the signals fell within the default tolerance of 0.

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1,runID2);

% Get signal result
sig1Result1 = getResultByIndex(diffRun1,1);
sig2Result1 = getResultByIndex(diffRun1,2);

% Check whether signals matched
sig1Result1.Status
ans = OutOfTolerance

sig2Result1.Status
ans = OutOfTolerance

**Compare Runs with Signal Tolerances**

The signals did not match within the default tolerance of 0. To further analyze the effect of the time constant change, add signal tolerances to the comparison with the baseline signal properties to determine the tolerance required for a pass. This example uses a combination of time and absolute tolerances.

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run1,2);

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

% Set tolerances for q, rad/sec
sig1.AbsTol = 0.1;
sig1.TimeTol = 0.6;

% Set tolerances for alpha, rad
sig2.AbsTol = 0.2;
sig2.TimeTol = 0.8;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1,runID2);
sig1Result2 = getResultByIndex(diffRun2,1);
sig2Result2 = getResultByIndex(diffRun2,2);

% Check the result
sig1Result2.Status
ans = WithinTolerance

sig2Result2.Status
ans = WithinTolerance

Output Arguments

runIDs — Matrix of Simulation Data Inspector run IDs
matrix

Matrix of run IDs in the Simulation Data Inspector repository.

Simulink.sdi.getArchiveRunLimit

Package: Simulink.sdi

Determine configured run limit for Simulation Data Inspector archive

Syntax

limit = Simulink.sdi.getArchiveRunLimit

Description

limit = Simulink.sdi.getArchiveRunLimit returns the limit configured for the number of runs the Simulation Data Inspector stores in the archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive on a first-in, first-out basis. When another run enters the archive, the Simulation Data Inspector deletes the run that has been in the archive the longest. A limit of -1 indicates the archive has no limit for the number of runs it stores. A limit of 0 means that the archive cannot contain any runs.

Tip To retain data for only the current run, configure the Simulation Data Inspector to automatically archive runs and set the archive run limit to 0.

Examples

Configure the Simulation Data Inspector Archive

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

Simulink.sdi.setArchiveRunLimit(0)
Simulink.sdi.setAutoArchiveMode(true)

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)

Output Arguments

**limit** — Maximum number of runs to store in the Simulation Data Inspector archive  
scalar

Limit for the number of runs stored in the Simulation Data Inspector archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive, on a first-in, first-out basis. A limit of -1 indicates there is no limit on the runs stored in the archive. A limit of 0 indicates that the archive cannot contain any runs.

Topics

“Iterate Model Design Using the Simulation Data Inspector”
Introduced in R2018b
Simulink.sdi.getAutoArchiveMode

**Package:** Simulink.sdi

Determine if the Simulation Data Inspector is configured to automatically archive

**Syntax**

mode = Simulink.sdi.getAutoArchiveMode

**Description**

mode = Simulink.sdi.getAutoArchiveMode returns a logical value that indicates whether the Simulation Data Inspector is configured to automatically archive simulation runs. When mode is true, the Simulation Data Inspector automatically archives simulation runs. When mode is false, the Simulation Data Inspector does not automatically archive.

**Examples**

**Configure the Simulation Data Inspector Archive**

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```matlab
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.
Simulink.sdi.setArchiveRunLimit(0)
Simulink.sdi.setAutoArchiveMode(true)

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)

**Output Arguments**

**mode** — Logical indication of Simulation Data Inspector automatic archive configuration

logical

Logical value that indicates whether the Simulation Data Inspector is configured to automatically archive simulation runs.

- **true** — The Simulation Data Inspector automatically archives simulation runs.
- **false** — The Simulation Data Inspector does not automatically archive simulation runs.

**See Also**

Simulink.sdi.getArchiveRunLimit | Simulink.sdi.setArchiveRunLimit | Simulink.sdi.setAutoArchiveMode

“Iterate Model Design Using the Simulation Data Inspector”

**Introduced in R2018b**
Simulink.sdi.getBorderOn

Get border display setting for time plots

Syntax

border = Simulink.sdi.getBorderOn

Description

border = Simulink.sdi.getBorderOn returns the current setting for whether borders are displayed on time plots in the Simulation Data Inspector. The return value corresponds to the setting for **Show border** in the Simulation Data Inspector **Time Plot Settings**. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays the border on time plots.

Examples

Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```matlab
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```
Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```matlab
border = Simulink.sdi.getBorderOn;
```

Hide the Border on Time Plots

```matlab
Simulink.sdi.setBorderOn(false)
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Show the Border on Time Plots

```matlab
Simulink.sdi.setBorderOn(true)
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Output Arguments

**border — Border display setting for time plots**

```plaintext
type: true or 1 | false or 0
```

Border display setting for time plots in the Simulation Data Inspector.

- **true or 1** — Border displayed for time plots.
- **false or 0** — Border hidden for time plots.

Topics
“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.getGridOn

Package: Simulink.sdi

Determine grid configuration for time plots

Syntax

grid = Simulink.sdi.getGridOn

Description

grid = Simulink.sdi.getGridOn returns the grid configuration for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

Examples

Configure Grid for Time Plots in the Simulation Data Inspector

You can use Simulink.sdi.setGridOn to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use Simulink.sdi.getGridOn to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a Simulink.sdi.CustomSnapshot object to specify settings for the output of the Simulink.sdi.snapshot function.

snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```matlab
gridInit = Simulink.sdi.getGridOn;
```

**Configure Horizontal Grid Lines**

Show only horizontal grid lines in the Simulation Data Inspector.

```matlab
Simulink.sdi.setGridOn('horizontal')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

**Configure Vertical Grid Lines**

Show only vertical grid lines in the Simulation Data Inspector.
Simulink.sdi.setGridOn('vertical')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);

**Configure No Grid Lines**

Show no grid lines in the Simulation Data Inspector.

Simulink.sdi.setGridOn('off')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

Simulink.sdi.setGridOn('on')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
Output Arguments

grid — Time plot grid configuration
'on' (default) | 'horizontal' | 'vertical' | 'off'

Grid configuration for time plots in the Simulation Data Inspector.

- 'on' — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
- 'horizontal' — Only horizontal grid lines are shown on time plots in the Simulation Data Inspector.
- 'vertical' — Only vertical grid lines are shown on time plots in the Simulation Data Inspector.
• 'off' — No grid lines are shown on time plots in the Simulation Data Inspector.

Compatibility Considerations

Simulink.sdi.getGridOn return values have changed

Behavior changed in R2019b

Starting in R2019b, the Simulink.sdi.getGridOn return values changed to:

• 'on'
• 'horizontal'
• 'vertical'
• 'off'

In R2019a, the Simulink.sdi.getGridOn returned a logical value:

• true or 1 — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
• false or 0 — Horizontal and vertical grid lines are hidden on time plots in the Simulation Data Inspector.

Starting in R2019b, the 'on' return value is equivalent to the true or 1 return, and the 'off' return value is equivalent to the false or 0 return.

Topics

“Create Plots Using the Simulation Data Inspector”
“View Data with the Simulation Data Inspector”

Introduced in R2019a
Simulink.sdi.getMarkersOn

**Package:** Simulink.sdi

Determine if data markers are shown in the Simulation Data Inspector

**Syntax**

```matlab
markersOn = Simulink.sdi.getMarkersOn
```

**Description**

`markersOn = Simulink.sdi.getMarkersOn` returns a logical value indicating whether data markers are displayed on plots in the Simulation Data Inspector.

**Examples**

**Store Marker State**

You can check and store the value of the *Show markers* setting in the Simulation Data Inspector from the command window or in a script.

```matlab
markersOn = Simulink.sdi.getMarkersOn;
```

**Output Arguments**

- `markersOn` — Logical indication of marker state
  - `false` or `0` (default) | `true` or `1`

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- `true` or `1` indicates that markers are displayed.
false or 0 indicates that markers are not displayed.

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2017b
Simulink.sdi.getRun

**Package:** Simulink.sdi

Get a Simulink.sdi.Run object to access data

**Syntax**

```matlab
run = Simulink.sdi.getRun(runID)
```

**Description**

```matlab
run = Simulink.sdi.getRun(runID)
```
returns a Simulink.sdi.Run object that provides access to the data in the run corresponding to the runID. The Simulation Data Inspector assigns run IDs when it creates a run. You can get the run ID for your run using Simulink.sdi.getAllRunIDs or Simulink.sdi.getRunIDByIndex.

**Examples**

**Get a Run Object for Simulation Data**

Many workflows using the Simulation Data Inspector programmatic interface start with acquiring a Simulink.sdi.Run object for your simulation data.

```matlab
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object
run = Simulink.sdi.getRun(runID);
```
You can use the Simulink.sdi.Run object to access signal data, add data, and inspect run metadata.

**Plot Signals from a Simulation Run**

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that you can use to plot the data.

**Create a Simulation Run and Access the Run Object**

The sldemo_fuelsys model includes several signals that are marked for logging. To create a simulation run containing the logged data, simulate the model.

```matlab
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning each run created by simulation, importing data, or opening a session a unique numeric ID. To access the run object for the simulation just performed, use the Simulink.sdi.getAllRunIDs function and take the last run ID in the returned vector.

```matlab
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run of interest, you can use the Simulink.sdi.getRun function to get the Simulink.sdi.Run object corresponding to the run. You can use the Run object to check metadata associated with the run, including the number of signals in the run.

```matlab
vdpRun = Simulink.sdi.getRun(runID);

vdpRun.SignalCount
ans = int32
    2
```

**Plot Data Using Signal Objects**

Use the getSignalByIndex function to access signals of interest from the Run object, fuelRun.

```matlab
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the Simulink.sdi.setSubPlotLayout function to specify a 3-by-1 layout.
Simulink.sdi.setSubPlotLayout(2,1)

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

`Simulink.sdi.clearAllSubPlots`

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

`signal1.Checked = true; plotOnSubPlot(signal2,2,1,true);`

**View the Plotted Data**

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.
Input Arguments

runID — Numeric run identifier
scalar

Run ID for the run you want a `Simulink.sdi.Run` object for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`. 
Output Arguments

run — Simulink.sdi.Run object
'Simulink.sdi.Run'

Simulink.sdi.Run object for the run corresponding to the run ID.

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.getRunCount

**Package:** Simulink.sdi

Get number of runs in Simulation Data Inspector repository

**Syntax**

count = Simulink.sdi.getRunCount

**Description**

count = Simulink.sdi.getRunCount returns the number of runs in the Simulation Data Inspector repository. You can use the run count to loop over all runs in the Simulation Data Inspector repository to modify run or signal properties. For example, you could add an absolute tolerance to a signal in every run.

**Examples**

**Modify Parameter for Several Runs**

This example shows how to modify a parameter for all the runs in the Simulation Data Inspector programmatically.

**Generate Runs**

Load the vdp model and mark the x1 and x2 signals for logging. Then, run several simulations.

% Clear all data from the Simulation Data Inspector repository
Simulink.sdi.clear

% Load the model and mark signals of interest for streaming
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Simulate the model with several Mu values
for gain = 1:5
    gainVal = num2str(gain);
    set_param('vdp/Mu','Gain',gainVal)
    sim('vdp');
end

Use Simulink.sdi.getRunCount to Assign Tolerance to x1 Signals

count = Simulink.sdi.getRunCount;

for a = 1:count
    runID = Simulink.sdi.getRunIDByIndex(a);
    vdpRun = Simulink.sdi.getRun(runID);
    sig = vdpRun.getSignalByIndex(1);
    sig.AbsTol = 0.1;
end

% Open the Simulation Data Inspector to view your data
Simulink.sdi.view

Output Arguments

count — Number of runs
scalar

Number of runs in the Simulation Data Inspector repository.

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.getRunIDByIndex

**Package:** Simulink.sdi

Use Simulation Data Inspector run index to get run ID

**Syntax**

```matlab
runID = Simulink.sdi.getRunIDByIndex(index)
```

**Description**

`runID = Simulink.sdi.getRunIDByIndex(index)` returns the run ID for the run with the specified index in the Simulation Data Inspector repository.

**Examples**

**Get Run ID for a Simulation**

Many workflows that use the Simulation Data Inspector programmatic interface start with obtaining the ID for a simulation run. This example shows two different methods to use the programmatic interface to get the run ID for a run. You can use the run ID to create a Simulink.sdi.Run object to access run data and metadata, or you can use the run ID for a comparison.

**Simulate a Model to Create a Run**

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```matlab
% Load and simulate system
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```
Get Run ID Using Simulink.sdi.getAllRunIDs

Simulink.sdi.getAllRunIDs returns an array of all run IDs for runs in the Simulation Data Inspector repository in order, with the most recently created run at the end.

```matlab
% Get runID for most recent run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use Simulink.sdi.getRunCount and Simulink.sdi.getRunIDByIndex to get the run ID for a run. This method is useful if you also want to use count as a counting variable to index through the runs in the Simulation Data Inspector repository.

```matlab
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

Input Arguments

- **index** — Run index in Simulation Data Inspector
  integer
  Positive, whole number index of the run in the Simulation Data Inspector repository.
  Example: 3

Output Arguments

- **runID** — Numeric run identifier
  scalar
  Numeric run identification assigned by the Simulation Data Inspector.

Introduced in R2011b
Simulink.sdi.getRunNamingRule

**Package:** Simulink.sdi

Get the Simulation Data Inspector rule for naming runs

**Syntax**

namingRule = Simulink.sdi.getRunNamingRule

**Description**

namingRule = Simulink.sdi.getRunNamingRule returns the run naming rule as a character vector. The run naming rule can contain one or more tokens that update for each run, for example, `<run_index>`. The run naming rule applies to runs automatically created through simulating a model in Simulink.

**Examples**

**Modify Run Naming Rule Then Restore Default**

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```matlab
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'

Output Arguments

namingRule — Naming rule for Simulation Data Inspector runs
character vector

Character vector that specifies the naming rule the Simulation Data Inspector uses to name the runs automatically created through simulating a Simulink model. The run naming rule can contain any of the following tokens that represent information pulled for each run:

- <run_index> – Run's index in the Simulation Data Inspector repository.
- <model_name> - Name of the model simulated to create the run.
- <time_stamp> - Start time for the simulation that created the run.
- <sim_mode> – Simulation mode used for the simulation that created the run.

Alternatives

You can view the run naming rule using the Simulation Data Inspector UI. You can find the New Run options under the Simulation Data Inspector Preferences menu.

Topics
“Inspect and Compare Data Programmatically”

Introduced in R2015a
**Simulink.sdi.getSignal**

**Package:** Simulink.sdi

Get Simulink.sdi.Signal object for a signal

**Syntax**

\[
\text{signalObj} = \text{Simulink.sdi.getSignal}(\text{sigID})
\]

**Description**

\[
\text{signalObj} = \text{Simulink.sdi.getSignal}(\text{sigID}) \text{ returns a Simulink.sdi.Signal object for the signal in the Simulation Data Inspector repository that corresponds to the signal ID, sigID. The Simulink.sdi.Signal object manages signal data and metadata and allows you to view and modify signal properties.}
\]

**Examples**

**Create a Simulation Data Inspector Run and Access Signal Data**

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

**Generate Data for Run**

For this example, create timeseries data for sine and cosine signals.

\[
% \text{Create timeseries workspace data}
\text{time} = \text{linspace}(0, 20, 101);
\]

\[
\text{sine_vals} = \sin(2\pi/5*\text{time});
\]

\[
\text{sine_ts} = \text{timeseries}('sine_vals',\text{time});
\]

\[
\text{sine_ts.Name} = 'Sine, T=5';
\]
\[
\text{cos_vals} = \cos(2\pi/8\times\text{time});
\]
\[
\text{cos_ts} = \text{timeseries}([\text{cos_vals, time}]);
\]
\[
\text{cos_ts.Name} = '\text{Cosine, T=8}';
\]

**Create a Run and Return Signal IDs**

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

\[
[\text{runID, runIndex, sigIDs}] = \text{Simulink.sdi.createRun('Sinusoids','vars',...}
\text{sine_ts,cos_ts});
\]

\[
\text{cosID} = \text{sigIDs}(2);
\]
\[
\text{cosSig} = \text{Simulink.sdi.getSignal(cosID)};
\]

**Modify Signal Properties and View in the Simulation Data Inspector**

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

\[
\text{cosSig.Checked} = \text{true};
\]
\[
\text{cosSig.AbsTol} = 0.05;
\]
\[
\text{Simulink.sdi.view}
\]
\[
\text{cosSig.Name}
\]

**Input Arguments**

- **sigID** — Signal ID
  scalar

  Signal identifier. The Simulation Data Inspector assigns signal IDs to signals when a run is created. You can get the signal ID for a signal as a return from `Simulink.sdi.createRun` or using the `Simulink.sdi.Run` object's methods.

**Output Arguments**

- **signalObj** — `Simulink.sdi.Signal` object
  
  'Simulink.sdi.Signal' object

  Simulink.sdi.Signal object for the signal corresponding to `sigID`.

getSignalIDByIndex

Topics
“Inspect and Compare Data Programatically”

Introduced in R2011b
Simulink.sdi.getTickLabelsDisplay

Get tick mark label setting for time plots

Syntax

tickLabels = Simulink.sdi.getTickLabelsDisplay

Description

tickLabels = Simulink.sdi.getTickLabelsDisplay returns the current setting for displayed tick mark labels on time plots in the Simulation Data Inspector. The return value corresponds to the setting for Tick labels in the Simulation Data Inspector Time Plot Settings. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both axes on time plots.

Examples

Configure Tick Mark Label Visibility for Time Plots

You can use the Simulink.sdi.setTickLabelsDisplay function to configure the visibility of tick mark labels for the t- and y-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the Simulink.sdi.getTickLabelsDisplay function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the Simulink.sdi.snapshot function with settings specified by a Simulink.sdi.CustomSnapshot object.

snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```matlab
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

Show Only t-Axis Tick Mark Labels

Show the tick mark labels for the t-Axis.

```matlab
Simulink.sdi.setTickLabelsDisplay('t-axis');
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```matlab
Simulink.sdi.setTickLabelsDisplay('y-axis')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```matlab
Simulink.sdi.setTickLabelsDisplay('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```matlab
Simulink.sdi.setTickLabelsDisplay('all')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Output Arguments

tickLabels — Time plot axes that display tick mark labels
'all' | 't-axis' | 'y-axis' | 'none'

Current setting for tick mark labels displayed on time plots in the Simulation Data Inspector:

- 'all' — Tick mark labels displayed for both time plot axes.
- 't-axis' — Tick mark labels displayed only on the t-axis for time plots.
- 'y-axis' — Tick mark labels displayed only on the y-axis for time plots.
- 'none' — No tick mark labels displayed on time plots.

Topics
“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.getTicksPosition

Get tick mark position setting for time plots

Syntax

ticksPos = Simulink.sdi.getTicksPosition

Description

ticksPos = Simulink.sdi.getTicksPosition returns the current setting for the position of tick marks on time plots in the Simulation Data Inspector. The return value corresponds to the setting for the Ticks setting in the Simulation Data Inspector Time Plot Settings. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area for time plots.

Examples

Configure Position for Tick Marks on Time Plots

You can use Simulink.sdi.setTicksPosition function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the Simulink.sdi.getTicksPosition function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using Simulink.sdi.snapshot with settings specified by a Simulink.sdi.CustomSnapshot object.

snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

initTickPos = Simulink.sdi.getTicksPosition;

Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

Simulink.sdi.setTicksPosition('inside')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
**Hide Tick Marks on Time Plots**

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```matlab
Simulink.sdi.setTicksPosition('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

**Position Tick Marks Outside Plot Area**

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```matlab
Simulink.sdi.setTicksPosition('outside')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Output Arguments

ticksPos — Current setting for tick mark position on time plots
'outside' | 'inside' | 'none'

Current setting for the position of tick marks on time plots in the Simulation Data Inspector.

“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.isPCTSupportEnabled

Determine status and mode for Parallel Computing Toolbox support

Syntax

[enabled, mode] = Simulink.sdi.isPCTSupportEnabled

Description

[enabled, mode] = Simulink.sdi.isPCTSupportEnabled returns enabled, a logical indication of whether support for the Parallel Computing Toolbox is enabled, and mode, the mode of support enabled.

Examples

Check Status of Parallel Worker Support

Before running code that depends on whether automatic import of runs created by parallel workers is enabled, you can use the Simulink.sdi.isPCTSupportEnabled function to check the support status. The default behavior for the Simulation Data Inspector enables parallel worker support in local mode. In local mode, only runs created on local workers automatically import into the Simulation Data Inspector.

[enabled, mode] = Simulink.sdi.isPCTSupportEnabled

enabled =

    logical

    1

mode =
'local'

Output Arguments

enabled — Logical indicator of parallel worker support
logical

Logical indication of parallel worker support.

• 1 indicates that support for parallel workers is enabled.
• 0 indicates that support for parallel workers is not enabled.

mode — Parallel worker support mode
local (default)

Mode of Parallel Computing Toolbox support.

• 'local' — Runs generated on local workers automatically import to the Simulation Data Inspector.
• 'none' — Parallel worker support is disabled.
• 'all' — Runs created from local and remote workers automatically import to the Simulation Data Inspector.
• 'manual' — Support for manual import of runs created by parallel workers using the Simulink.sdi.sendWorkerRunToClient function.

Simulink.sdi.isValidRunID

**Package:** Simulink.sdi

Determine whether a run ID is valid

**Syntax**

```matlab
valid = Simulink.sdi.isValidRunID(runID)
```

**Description**

```matlab
valid = Simulink.sdi.isValidRunID(runID)
```

returns **true** if **runID** corresponds to a run in the Simulation Data Inspector repository.

**Examples**

**Check Run ID Validity**

This example shows how to check whether a run ID is valid. You can use `Simulink.sdi.isValidRunID` to ensure you have valid data throughout your script.

**Create a Simulation Run**

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector, and use `Simulink.sdi.getAllRunIDs` to get its run ID.

```matlab
% Simulate model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get run ID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```
Check Run ID Validity

Check to verify that the Simulation Data Inspector has a run corresponding to the run ID.

```matlab
Simulink.sdi.isValidRunID(runID)
```

ans = logical

1

Delete the Run and Check Validity

You can delete runs to clear out memory space or clean up the Simulation Data Inspector UI. When you delete a run, the run ID for that run becomes invalid.

```matlab
Simulink.sdi.deleteRun(runID)
Simulink.sdi.isValidRunID(runID)
```

ans = logical

0

Input Arguments

runID — Simulation Data Inspector run identifier
scalar

Unique numeric identification for the run. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using Simulink.sdi.getAllRunIDs or Simulink.sdi.getRunIDByIndex.

Output Arguments

valid — Run validity indicator
logical

Run validity indicator. When valid is true, the runID is valid. When valid is false, the runID is invalid.
See Also
Simulink.sdi.compareRuns | Simulink.sdi.createRun |
Simulink.sdi.deleteRun | Simulink.sdi.getAllRunIDs |

“Inspect and Compare Data Programmatically”

Introduced in R2011b
Simulink.sdi.load

**Package:** Simulink.sdi

Load a Simulation Data Inspector session or view

**Syntax**

valid = Simulink.sdi.load(fileName)

**Description**

valid = Simulink.sdi.load(fileName) loads the data in the MLDATX-file or MAT-file specified by fileName and returns 1 when fileName is a valid file. A return value of 0 indicates that the file specified by fileName is invalid and cannot be loaded into the Simulation Data Inspector. You can use Simulink.sdi.load to load Simulation Data Inspector sessions and views. A view includes preferences and visualization options but does not save data. A session saves data along with preference selections and plot configurations.

**Examples**

**Save a Simulation Data Inspector Session**

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.
Create Simulation Data

This example logs the Stick, alpha, \( \text{rad} \), and \( q \), rad/sec signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```matlab
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear

% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')

Access Simulation Data

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

```matlab
% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);
sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);
```
squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);

**Create Plots in the Simulation Data Inspector**

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.

% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)

**Save a Simulation Data Inspector Session**

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')

**Load a Simulation Data Inspector Session**

First, clear the Simulation Data Inspector repository with Simulink.sdi.clear and reset visualization settings with Simulink.sdi.clearPreferences. Then, you can load the session to see how the data and settings are preserved.

% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences
% Load session file to view data
Simulink.sdi.load('myData.mldatx');

**Input Arguments**

`fileName` — Name of file to load
character vector

Name of the file to load with the session or view data.
Example: 'myData.mldatx'
Example: 'myData.mat'

**Output Arguments**

`valid` — File validity indicator
logical

Validity indicator for the file. When the file specified by `fileName` is valid, `valid` is 1. A valid value of 0 indicates an invalid file.

**See Also**

`Simulink.sdi.close` | `Simulink.sdi.createRun` | `Simulink.sdi.save`

**Introduced in R2011b**
Simulink.sdi.markSignalForStreaming

Package: Simulink.sdi

Turn logging on or off for a signal

Syntax

Simulink.sdi.markSignalForStreaming(block,portIndex,log)
Simulink.sdi.markSignalForStreaming(portHandle,log)
Simulink.sdi.markSignalForStreaming(lineHandle,log)

Description

Simulink.sdi.markSignalForStreaming(block,portIndex,log) marks the signal on the specified portIndex of the specified block for logging when you specify log as 'on'. To stop logging a signal, specify log as 'off'.

Simulink.sdi.markSignalForStreaming(portHandle,log) marks the signal on the port specified by portHandle for logging when you specify log as 'on'. To stop logging a signal, specify log as 'off'.

Simulink.sdi.markSignalForStreaming(lineHandle,log) marks the signal with the specified lineHandle for logging when you specify log as 'on'. To stop logging a signal, specify log as 'off'.

Examples

Compare Signals Within a Simulation Run

This example uses the slexAircraftExample model to demonstrate the comparison of the input and output signals for a control system. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.
% Load model slexAircraftExample and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate model slexAircraftExample
out = sim('slexAircraftExample');

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

% Get Run object
aircraftRun = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = getSignalIDByIndex(aircraftRun,1);
signalID2 = getSignalIDByIndex(aircraftRun,2);

if (isValidSignalID(aircraftRun,signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (isValidSignalID(aircraftRun,signalID1) && isValidSignalID(aircraftRun,signalID2))
    % Compare signals
    sigDiff = Simulink.sdi.compareSignals(signalID1,signalID2);

    % Check whether signal result status
    match = sigDiff.Status
end

match =
OutOfRange

**Mark Signals for Logging with Port Handles**

This example shows how to mark signals for logging using port handles.
Load Model and Mark Signals for Streaming

User `get_param` to get the port handles for the blocks with your signals of interest. Then, use the handle to mark the desired signals for logging.

```matlab
load_system('vdp')

% Get port handles
x1_handles = get_param('vdp/x1','PortHandles');
x1 = x1_handles.Outport(1);
x2_handles = get_param('vdp/x2','PortHandles');
x2 = x2_handles.Outport(1);

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(x1,'on');
Simulink.sdi.markSignalForStreaming(x2,'on');
```

Simulate Model and View Signals in the Simulation Data Inspector

Simulate the model and then open the Simulation Data Inspector to view the logged signals.

```matlab
sim('vdp');
Simulink.sdi.view
```

Mark Signals for Logging with Line Handles

This example shows how to mark signals for logging using their line handles.

Load System and Mark Signals for Logging

Load a model and use `get_param` to get handles for the signals in the model. Then, use the line handles to mark signals of interest for logging.

```matlab
load_system('slexAircraftExample')
lines = get_param('slexAircraftExample','Lines');
sig1handle = lines(1).Handle;
sig2handle = lines(2).Handle;
```
Simulink.sdi.markSignalForStreaming(sig1handle,'on')
Simulink.sdi.markSignalForStreaming(sig2handle,'on')

**Simulate Model and View Signals**

Simulate the model and view the signals marked for logging in the Simulation Data Inspector.

```matlab
sim('slexAircraftExample')
```

Simulink.sdi.view

**Input Arguments**

**block** — Source block path or handle
character vector

Block path for the block with the desired signal connected to one of its outputs.

Example: 'slexAircraftExample/Pilot'

**portIndex** — Source block output port index
integer

Index of the port connected to the signal you want to mark for streaming.

Example: 1

**log** — Logging state
'on' | 'off'

Logging state desired for signal.

- 'on' -- Turn logging on for a signal.
- 'off' -- Turn logging off for a signal.

**portHandle** — Source block output port handle
handle

Port handle for the source block's output port that connects to the signal.

Example: x1_handles.Outport(1)
**lineHandle — Signal line handle**

handle

Line handle for the signal.

Example: `lines(1).Handle`

“Inspect and Compare Data Programmatically”

“View Data with the Simulation Data Inspector”

**Introduced in R2015b**
Simulink.sdi.report

Package: Simulink.sdi

Generate a Simulation Data Inspector report

Syntax

Simulink.sdi.report
Simulink.sdi.report(Name,Value)

Description

Simulink.sdi.report creates a Simulation Data Inspector report of the plotted data in the Inspect pane of the Simulation Data Inspector.

Simulink.sdi.report(Name,Value) uses additional options specified by one or more Name,Value pair arguments to generate a report of the specified view in the Simulation Data Inspector.

Examples

Generate a Simulation Data Inspector Report Programmatically

This example shows how to create reports using the Simulation Data Inspector programmatic interface. You can create a report for plotted signals in the Inspect pane or for comparison data in the Compare pane. This example first generates data by simulating a model, then shows how to create an Inspect Signals report. To run the example exactly as shown, ensure that the Simulation Data Inspector repository starts empty with the Simulink.sdi.clear function.

Generate Data

This example generates data using model ex_sldemo_absbrake with two different desired slip ratios.
% Ensure Simulation Data Inspector is empty
Simulink.sdi.clear

% Open model
load_system('ex_sldemo_absbrake')

% Set slip ratio and simulate model
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake');

% Set new slip ratio and simulate model again
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake');

---

**Plot Signals in the Inspect Pane**

The Inspect Signals report includes all signals plotted in the graphical viewing area of the Inspect pane and all displayed metadata for the plotted signals.

% Get Simulink.sdi.Run objects
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Get Simulink.sdi.Signal objects for slp signal
run1_slp = run1.getSignalByIndex(4);
run2_slp = run2.getSignalByIndex(4);

% Plot slp signals
run1_slp.plotOnSubPlot(1, 1, true)
run2_slp.plotOnSubPlot(1, 1, true)

---

**Create a Report of Signals Plotted in Inspect Pane**

You can include more data in the report by adding more columns using the Simulation Data Inspector UI, or you can specify the information you want in the report programmatically with Name-Value pairs and the enumeration class Simulink.sdi.SignalMetaData. This example shows how to specify the data in the report programmatically.

% Specify report parameters
reportType = 'Inspect Signals';
reportName = 'Data_Report.html';

signalMetadata = [Simulink.sdi.SignalMetaData.Run, ...
                Simulink.sdi.SignalMetaData.Line, ...
                Simulink.sdi.SignalMetaData.BlockName, ...
                Simulink.sdi.SignalMetaData.SignalName];

Simulink.sdi.report('ReportToCreate', reportType, 'ReportOutputFile', ...
                     reportName, 'ColumnsToReport', signalMetadata);

### Input Arguments

#### Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: 'ReportToCreate','Compare Runs','ShortenBlockPath',true

**ReportToCreate — Information to include in the report**

Inspect Signals' (default) | 'Compare Runs'

Simulation Data Inspector pane to capture in the report.

- 'Inspect Signals' -- Create a report of the information on the Inspect pane.
- 'Compare Runs' -- Create a report of the information on the Compare pane.

Example: 'ReportToCreate','Inspect Signals'
Example: 'ReportToCreate','Compare Runs'

**ReportOutputFolder — Folder where report is saved**

<current working folder>/slprj/sdi (default) | path

Folder where the report is saved. Specify the path to the folder where you want to save the report as a character vector.

Example: 'ReportOutputFolder','C:\Users\user1\Desktop'
ReportOutputFile — Report file name
'SDI_report.html' (default) | character vector

File name for report.
Example: 'ReportOutputFile','MyReport.html'

PreventOverwritingFile — Report overwrite prevention
true (default) | false

File overwrite protection for the report. File overwrite protection prevents the Simulation Data Inspector from overwriting an existing file by appending the file name with a number that increments for subsequent reports. When you disable file overwrite protection, the Simulation Data Inspector overwrites the existing report file unless you specify a unique file name.

- true enables file overwrite protection.
- false disables file overwrite protection.

Example: 'PreventOverwritingFile',true
Example: 'PreventOverwritingFile',false

ColumnsToReport — Signal metadata to include in report
array

Signal metadata to include in report. By default, the Inspect Signals report includes the block path, name, line style and color, and data source parameters for each plotted signal. The Compare Runs report includes the signal name, absolute tolerance, relative tolerance, and maximum difference metadata by default.

Specify metadata to include as an array, using the enumeration class Simulink.sdi.SignalMetaData. For example, to include the name of the simulation run and signal name, create an array like signal_metadata:

```matlab
signal_metadata = [Simulink.sdi.SignalMetaData.Run,...
                   Simulink.sdi.SignalMetaData.SignalName];
```

Then, specify ColumnsToReport as signal_metadata in the name-value pair:

```matlab
Simulink.sdi.report('ColumnsToReport',signal_metadata)
```

The table summarizes the metadata available for Inspect Signals report.
<table>
<thead>
<tr>

Example: 'ColumnsToReport',metadata

**ShortenBlockPath — Block path length**

*true (default) | false*

Block path length.

- **true** -- Report shortened block path length.
- **false** -- Include the full block path in the report.
Example: 'ShortenBlockPath',false

**LaunchReport — Open report when created**

true (default) | false

Open report when created.

- true -- Open the report when it is created.
- false -- Do not open the report upon creation.

Example: 'LaunchReport',false

**SignalsToReport — Signals to include in a Compare Runs report**

'REportOnlyMismatchedSignals' (default) | 'ReportAllSignals'

Signals to include in a Compare Runs report.

- ReportOnlyMismatchedSignals -- Include only signals that fall out of tolerance.
- ReportAllSignals -- Include all signals.

Example: 'SignalsToReport','ReportAllSignals'

“Create Plots Using the Simulation Data Inspector”
“Save and Share Simulation Data Inspector Data and Views”

**Introduced in R2011b**
Simulink.sdi.resetRunNamingRule

**Package:** Simulink.sdi

Revert the Simulation Data Inspector run naming rule to default

**Syntax**

Simulink.sdi.resetRunNamingRule

**Description**

Simulink.sdi.resetRunNamingRule resets the run naming rule the Simulation Data Inspector uses to assign a name to runs created through simulating a Simulink model to its default 'Run <run_index>: <model_name>'.

**Examples**

**Modify then Reset Run Naming Rule**

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, reset the run naming rule to its default, and check the run naming rule.

```matlab
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
```
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 1'

% Reset the run naming rule
Simulink.sdi.resetRunNamingRule

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'

Alternatives

You can reset the run naming rule to its default using the Simulation Data Inspector UI. Use the Restore Defaults button on the New Run tab under Simulation Data Inspector Preferences.

Simulink.sdi.clearPreferences restores the run naming rule, along with all other Simulation Data Inspector preferences.

Topics

“Inspect and Compare Data Programmatically”
“Organize Your Simulation Data Inspector Workspace”

Introduced in R2015a
Simulink.sdi.save

**Package:** Simulink.sdi

Save Simulation Data Inspector session

**Syntax**

```matlab
Simulink.sdi.save(fileName)
```

**Description**

`Simulink.sdi.save(fileName)` saves all runs, signals, and plot settings as a Simulation Data Inspector session in the file `fileName`.

**Examples**

**Save a Simulation Data Inspector Session**

This example shows how to create, save, and load a Simulation Data Inspector session. The example uses data logging to populate the Simulation Data Inspector with data and then uses the Simulation Data Inspector's programmatic interface to create plots to visualize the data. After saving the data and visualization settings in a session, the Simulation Data Inspector repository is emptied in order to demonstrate how to load the session.

**Create Simulation Data**

This example logs the Stick, alpha, rad, and q, rad/sec signals to generate simulation data using the model `slexAircraftExample` and creates two runs. The first uses a sine input, and the second has a square wave input.

```matlab
% Ensure you start with an empty Simulation Data Inspector repository
Simulink.sdi.clear
```
% Load system
load_system('slexAircraftExample')

% Configure signals to log
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Change Pilot signal to sine
set_param('slexAircraftExample/Pilot','WaveForm','sine')

% Simulate model
sim('slexAircraftExample')

% Change Pilot signal to square
set_param('slexAircraftExample/Pilot','WaveForm','square')

% Simulate model
sim('slexAircraftExample')

**Access Simulation Data**

Use the Simulation Data Inspector programmatic interface to access the simulation data so you can create plots to visualize the signals.

% Get run objects
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);
sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);

% Get signal objects
sineOut = sineRun.getSignalByIndex(1);
sineIn = sineRun.getSignalByIndex(3);
squareOut = squareRun.getSignalByIndex(1);
squareIn = squareRun.getSignalByIndex(3);

**Create Plots in the Simulation Data Inspector**

Use the programmatic interface to visualize the signal data from the two simulation runs. You can set the plot layout and plot signals on specific subplots.
% Set subplot layout
Simulink.sdi.setSubPlotLayout(2,1)

% Plot sine data on top plot
sineIn.plotOnSubPlot(1,1,true)
sineOut.plotOnSubPlot(1,1,true)

% Plot square wave data on bottom plot
squareIn.plotOnSubPlot(2,1,true)
squareOut.plotOnSubPlot(2,1,true)

**Save a Simulation Data Inspector Session**

First, view the plots you just created. Then, save the Simulation Data Inspector session as an MLDATX-file to recover your data along with your preference selections and plots.

% View the visualized data in the Simulation Data Inspector
Simulink.sdi.view

% Save the Simulation Data Inspector session
Simulink.sdi.save('myData.mldatx')

**Load a Simulation Data Inspector Session**

First, clear the Simulation Data Inspector repository with `Simulink.sdi.clear` and reset visualization settings with `Simulink.sdi.clearPreferences`. Then, you can load the session to see how the data and settings are preserved.

% Clear Simulation Data Inspector repository and preferences
Simulink.sdi.clear
Simulink.sdi.clearPreferences

% Load session file to view data
Simulink.sdi.load('myData.mldatx');

**Input Arguments**

`fileName` — File name  
character vector

Name for the session file.

Example: 'myData.mldatx'

“Inspect and Compare Data Programmatically”
“Save and Share Simulation Data Inspector Data and Views”

Introduced in R2011b
Simulink.sdi.sendWorkerRunToClient

**Package:** Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

**Syntax**

Simulink.sdi.sendWorkerRunToClient
Simulink.sdi.sendWorkerRunToClient(run)

**Description**

Simulink.sdi.sendWorkerRunToClient sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

Simulink.sdi.sendWorkerRunToClient(run) sends the run corresponding to run to the client MATLAB and imports the run to the Simulation Data Inspector.

**Examples**

**Manually Send Runs from Parallel Workers to the Simulation Data Inspector**

This example shows how to use Simulink.sdi.sendWorkerRunToClient to send runs created using parallel workers manually to the Simulation Data Inspector.

**Setup**

This example runs several simulations of the vdp model, varying the value of the gain, Mu. To set up for the parallel simulation, define a vector of Mu values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```matlab
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```
% Choose several Mu values
MuVals = [1 2 3 4];

**Initialize Parallel Workers**

Use `parpool` to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```matlab
p = gcp('nocreate');
if isempty(p)
    parpool(4);
end
Starting parallel pool (parpool) using the 'local' profile ... connected to 4 workers.
```

```
spmd

    % Load system and select signals to log
    load_system('vdp')
    Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
    Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

    % Create temporary directory for simulation on worker
    workDir = pwd;
    addpath(workDir)
    tempDir = tempname;
    mkdir(tempDir)
    cd(tempDir)

end

**Run Parallel Simulations with parfor**

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor`. Each worker runs a `vdp` simulation with a different
value of \( \mu \). Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```
parfor (index = 1:4)
    assignin('base','MuVal',MuVals(index));
    set_param('vdp/Mu','Gain','MuVal')
    sim('vdp')
```

**Access Data and Send Run to Client MATLAB**

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of \( \mu \) used in the simulation with the Tag property.

```
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
parRun = Simulink.sdi.getRun(runID);
parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

Simulink.sdi.sendWorkerRunToClient
```

**Close Temporary Directories and View Runs in the Simulation Data Inspector**

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of \( \mu \) used during simulation.

```
spmd

    Simulink.sdi.sendWorkerRunToClient

```

2-957
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
end

Simulink.sdi.view

### Input Arguments

**run** — Run ID or Simulink.sdi.Run object  
runID | Simulink.sdi.Run object

Run ID or Simulink.sdi.Run object corresponding to the run you want to import into the Simulation Data Inspector.

“Inspect and Compare Data Programmatically”

### Introduced in R2018a
Simulink.sdi.setArchiveRunLimit

**Package:** Simulink.sdi

Specify a limit for the number of runs stored in the Simulation Data Inspector archive

**Syntax**

Simulink.sdi.setArchiveRunLimit(limit)

**Description**

`Simulink.sdi.setArchiveRunLimit(limit)` sets the Simulation Data Inspector archive limit as specified by `limit`. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive on a first-in, first-out basis. When another run enters the archive, the Simulation Data Inspector deletes the run that has been in the archive the longest. A limit of -1 indicates that the archive has no limit for the number of runs it stores. A limit of 0 means that the archive cannot contain any runs.

**Tip** To retain data for only the current run, configure the Simulation Data Inspector to automatically archive runs and set the archive run limit to 0.

**Examples**

**Configure the Simulation Data Inspector to Retain Only the Current Run**

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

setArchiveRunLimit(0)
setAutoArchiveMode(true)

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)

**Input Arguments**

*limit — Maximum number of runs to store in the Simulation Data Inspector archive*

scalar

Limit for the number of runs stored in the Simulation Data Inspector archive. When the number of runs in the archive reaches the limit, the Simulation Data Inspector starts to delete runs from the archive, on a first-in, first-out basis. A limit of -1 indicates that there is no limit on the runs stored in the archive. A limit of 0 indicates that the archive cannot contain any runs.

Example: -1
Example: 10

**See Also**

Simulink.sdi.getArchiveRunLimit | Simulink.sdi.getAutoArchiveMode | Simulink.sdi.setAutoArchiveMode

**Topics**

“Iterate Model Design Using the Simulation Data Inspector”
Introduced in R2018b
Simulink.sdi.setAutoArchiveMode

**Package:** Simulink.sdi

Specify whether the Simulation Data Inspector automatically archives simulation runs

**Syntax**

Simulink.sdi.setAutoArchiveMode(mode)

**Description**

Simulink.sdi.setAutoArchiveMode(mode) configures the automatic archive behavior of the Simulation Data Inspector, according to mode. The Simulation Data Inspector automatically archives simulation runs when you specify mode as true. When you specify mode as false, the Simulation Data Inspector does not automatically archive.

**Examples**

**Configure the Simulation Data Inspector Archive**

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```matlab
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

```matlab
Simulink.sdi.setArchiveRunLimit(0)
Simulink.sdi.setAutoArchiveMode(true)
```
When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)

### Input Arguments

**mode** — Logical specification of Simulation Data Inspector automatic archive behavior

true (default) | false

Logical value that specifies whether the Simulation Data Inspector automatically archives simulation runs.

- true — The Simulation Data Inspector automatically archives simulation runs.
- false — The Simulation Data Inspector does not automatically archive simulation runs.

Example: false

Data Types: logical

### Topics

“Iterate Model Design Using the Simulation Data Inspector”

Introduced in R2018b
Simulink.sdi.setBorderOn

Display or hide border on time plots

Syntax

Simulink.sdi.setBorderOn(border)

Description

Simulink.sdi.setBorderOn(border) displays or hides the border on time plots in the Simulation Data Inspector according to the logical input, border. The function sets the value of the Show border setting in the Simulation Data Inspector Time Plot Settings. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector shows the border on time plots.

Examples

Configure Time Plot Border Display

You can use the Simulink.sdi.setBorderOn function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the Simulink.sdi.setBorderOn function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the Simulink.sdi.snapshot function with settings specified by a Simulink.sdi.CustomSnapshot object.

snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```matlab
border = Simulink.sdi.getBorderOn;
```

Hide the Border on Time Plots

```matlab
Simulink.sdi.setBorderOn(false)
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

Show the Border on Time Plots

```matlab
Simulink.sdi.setBorderOn(true)
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Input Arguments

**border — Display or hide time plot border**

true or 1 (default) | false or 0

Specify whether time plot borders are shown or hidden in the Simulation Data Inspector.

- true or 1 — Display border for time plots.
- false or 0 — Hide border for time plots.

Topics
“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
**Simulink.sdi.setGridOn**

**Package:** Simulink.sdi

Configure grid lines for time plots

**Syntax**

```
Simulink.sdi.setGridOn(grid)
```

**Description**

`Simulink.sdi.setGridOn(grid)` configures the grid lines for time plots in the Simulation Data Inspector according to the input, `grid`. The function configures the Horizontal and Vertical options for the Time Plot Settings in the Simulation Data Inspector. The settings apply to the session and configure the grids for all time plots. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

**Examples**

**Configure Grid for Time Plots in the Simulation Data Inspector**

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```
**Get Initial Grid Setting**

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

**Configure Horizontal Grid Lines**

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

**Configure Vertical Grid Lines**

Show only vertical grid lines in the Simulation Data Inspector.
Simulink.sdi.setGridOn('vertical')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);

Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

Simulink.sdi.setGridOn('off')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```matlab
Simulink.sdi.setGridOn('on')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
**Input Arguments**

`grid — Specify visible grid lines`

'on' (default) | 'horizontal' | 'vertical' | 'off'

Specify grid appearance for time plots in the Simulation Data Inspector:

- 'on' shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
- 'horizontal' shows only horizontal grid lines on time plots in the Simulation Data Inspector.
- 'vertical' shows only vertical grid lines on time plots in the Simulation Data Inspector.
• 'off' shows no grid lines on time plots in the Simulation Data Inspector.

Compatibility Considerations

Specifying the input as a logical value is not recommended

Starting in R2019b, the Simulink.sdi.setGridOn input values changed to:

• 'on'
• 'horizontal'
• 'vertical'
• 'off'

In R2019a, the Simulink.sdi.setGridOn accepted a logical input to show or hide the grid on time plots in the Simulation Data Inspector:

• true or 1 shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
• false or 0 hides horizontal and vertical grid lines on time plots in the Simulation Data Inspector.

Starting in R2019b, use the 'on' input value for the same behavior as the true or 1 input, and use the 'off' input value for the same behavior as the false or 0 input.

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Show or hide markers for plotted signals

Syntax

Simulink.sdi.setMarkersOn(value)

Description

Simulink.sdi.setMarkersOn(value) shows or hides markers on signals plotted in the Simulation Data Inspector according to the logical input, value. The function configures the Show markers setting in the Simulation Data Inspector. The setting applies to the session and shows or hides markers for all signals plotted in the Simulation Data Inspector. By default, markers are hidden in the Simulation Data Inspector.

Examples

Display Markers in the Simulation Data Inspector

Simulink.sdi.setMarkersOn(true);

Input Arguments

value — Logical input
false or 0 (default) | true or 1

Logical specification of whether markers are shown on plots in the Simulation Data Inspector:

- true or 1 shows markers on plots in the Simulation Data Inspector.
• false or 0 does not show markers on plots in the Simulation Data Inspector.

Data Types: logical

Introduced in R2017b
Simulink.sdi.setRunNamingRule

Package: Simulink.sdi

Specify the Simulation Data Inspector run naming rule

Syntax

Simulink.sdi.setRunNamingRule('rule')

Description

Simulink.sdi.setRunNamingRule('rule') sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

Examples

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'

**Input Arguments**

'rule' — Simulation Data Inspector run naming rule

'Run <run_index>: <model_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- `<run_index>` - Run's index in the Simulation Data Inspector repository.
- `<model_name>` - Name of the model simulated to create the run.
- `<time_stamp>` - Start time for the simulation that created the run.
- `<sim_mode>` - Simulation mode used for the simulation that created the run.

Example: '<time_stamp> Simulation <run_index>: <model_name>'
Example: '<model_name> - <run_index>'

**Alternatives**

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the **Name** property of its **Simulink.sdi.Run** object.

Introduced in R2011b
Simulink.sdi.setRunOverwrite

**Package:** Simulink.sdi

(Removed) Enable and disable run overwrite mode for a Simulation Data Inspector run

**Note** The Simulink.sdi.setRunOverwrite function has been removed. You can configure the Overwrite Run mode behavior using the Simulink.sdi.setAutoArchiveMode and Simulink.sdi.setArchiveRunLimit functions. For further details, see “Compatibility Considerations”.

**Syntax**

Simulink.sdi.setRunOverwrite(runID,overwrite)

**Description**

Simulink.sdi.setRunOverwrite(runID,overwrite) configures run overwrite mode for the run corresponding to runID, according to the value specified for overwrite.

**Examples**

**Configure the Simulation Data Inspector Archive**

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent accumulation of unwanted logged data on disk. First, check the configuration of the Simulation Data Inspector archive. You can save the parameters to restore your preferences after you finish designing or debugging.

```matlab
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```
Set the archive limit to 0 and configure the Simulation Data Inspector to automatically archive simulation runs.

```matlab
Simulink.sdi.setArchiveRunLimit(0)
Simulink.sdi.setAutoArchiveMode(true)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals in the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive back to its previous configuration.

```matlab
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

**Input Arguments**

- **runID** — Numeric run identifier
  
  scalar

  Run ID for the run you want to set run overwrite for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

- **overwrite** — Run overwrite enable/disable
  
  true | false

  Logical value for run overwrite mode. Specify `overwrite` as `true` to enable run overwrite mode for a run, and set `overwrite` to `false` to disable run overwrite mode for a run.

**Compatibility Considerations**

*Simulink.sdi.setRunOverwrite function has been removed*

*Errors starting in R2018b*

The `Simulink.sdi.setRunOverwrite` function is removed in R2018b with the introduction of the Simulation Data Inspector archive. You can configure the Overwrite
Run mode behavior using the new `Simulink.sdi.setAutoArchiveMode` and `Simulink.sdi.setArchiveRunLimit` functions. Enable the Simulation Data Inspector to automatically archive simulation runs, and set the archive limit to 0.

```matlab
Simulink.sdi.setAutoArchiveMode(true);
Simulink.sdi.setArchiveRunLimit(0);
```

With these settings, the Simulation Data Inspector retains the data for the current simulation run and discards the data for the previous simulation run. The view in the Simulation Data Inspector also updates to show signals in the current run, with consistent line styles and colors.

You can disable each aspect of the behavior separately. To retain prior run data, set the archive limit to a nonzero value. If you want no limit on the number of runs stored in the archive, you can specify `-1` as the archive limit. When you disable the **Automatically archive** setting, the Simulation Data Inspector does not move the prior run to the archive or update the view to show signals from the current run.

**See Also**

- `Simulink.sdi.setAutoArchiveMode`
- `Simulink.sdi.setArchiveRunLimit`
- `Simulink.sdi.setAutoArchiveMode`

**Topics**

- “Iterate Model Design Using the Simulation Data Inspector”

**Introduced in R2011b**
Simulink.sdi.setSubPlotLayout

**Package:** Simulink.sdi

Set subplot layout in the Simulation Data Inspector

**Syntax**

Simulink.sdi.setSubPlotLayout(r,c)

**Description**

Simulink.sdi.setSubPlotLayout(r,c) sets the grid layout of plots in the Simulation Data Inspector using the specified number of rows, r, and columns, c.

**Examples**

**Change Subplot Layout**

% Change subplot layout to 4 rows and 2 columns
Simulink.sdi.setSubPlotLayout(4,2);

**Create a Run and View the Data**

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

**Create Data for the Run**

This example creates timeseries objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

% Generate timeseries data
time = linspace(0, 20, 100);
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the create method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);

Plot Your Data Using the Simulink.sdi.Signal Object

The getSignalByIndex method returns a Simulink.sdi.Signal object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);
% View the signal in the Simulation Data Inspector
Simulink.sdi.view

Close the Simulation Data Inspector and Save Your Data
Simulink.sdi.close('sinusoids.mat')

Input Arguments

\( r \) — Number of rows
integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.
Example: 2
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

\( c \) — Number of columns
integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.
Example: 2
Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

Introduced in R2016a
Simulink.sdi.setTableGrouping

Package: Simulink.sdi

Change signal grouping hierarchy in Inspect pane

Syntax

Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping('group1')
Simulink.sdi.setTableGrouping('group1', 'group2')
Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')

Description

Simulink.sdi.setTableGrouping groups signals in the Inspect pane of the Simulation Data Inspector as a flat list.

Simulink.sdi.setTableGrouping('group1') groups signals in the Inspect pane by the parameter specified by group1.

Simulink.sdi.setTableGrouping('group1', 'group2') groups signals in the Inspect pane first by the parameter specified by group1 and then by the parameter specified by group2.

Simulink.sdi.setTableGrouping('group1', 'group2', 'group3') groups signals in the Inspect pane first by the parameter specified by group1, then by the parameter specified by group2, and finally by the parameter specified by group3. If you have a Simscape license, you have three options for table grouping.

Examples
Group Data by Model and Then Data Hierarchy

You can group your data in the navigation pane to visualize subsystem and data hierarchy relationships among signals clearly.

Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');

Input Arguments

'group1' — Signal grouping parameter
character vector

Parameter used to group signals in the Inspect pane of the Simulation Data Inspector. You can specify two grouping parameters, or three if you have a Simscape license.

- DataHierarchy groups signals according to any data hierarchy in the model, for example grouping signals in a bus together.
- SubSystems groups signals according to the model's subsystem hierarchy.
- PhysmodHierarchy groups signals according to the Simscape block structure. This parameter is only available with a Simscape license.

Example: 'SubSystems'
Example: 'DataHierarchy'
Data Types: char

Introduced in R2016a
Simulink.sdi.setTickLabelsDisplay

Configure tick label visibility for time plot axes

Syntax

Simulink.sdi.setTickLabelsDisplay(label)

Description

Simulink.sdi.setTickLabelsDisplay(label) displays labels for the tick marks on axes of time plots in the Simulation Data Inspector according to the input, label. The function sets the value of the **Tick labels** setting in the Simulation Data Inspector **Time Plot Settings**. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both time plot axes.

Examples

Configure Tick Mark Label Visibility for Time Plots

You can use the Simulink.sdi.setTickLabelsDisplay function to configure the visibility of tick mark labels for the t- and y-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the Simulink.sdi.getTickLabelsDisplay function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the Simulink.sdi.snapshot function with settings specified by a Simulink.sdi.CustomSnapshot object.

```matlab
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```
Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

\[
\text{initTickLabels} = \text{Simulink.sdi.getTickLabelsDisplay};
\]

Show Only t-Axis Tick Mark Labels

Show the tick mark labels for the \( t \)-Axis.

\[
\text{Simulink.sdi.setTickLabelsDisplay('t-axis')}\
\text{Simulink.sdi.snapshot('from','custom','settings',snapSettings)};
\]
**Show Only y-Axis Tick Mark Labels**

Show the tick mark labels for the y-axis.

```matlab
Simulink.sdi.setTickLabelsDisplay('y-axis')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

**Hide Tick Mark Labels**

You can hide the tick mark labels for both axes.

```matlab
Simulink.sdi.setTickLabelsDisplay('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

Simulink.sdi.setTickLabelsDisplay('all')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
Input Arguments

**label — Tick mark labels to display**

'\textit{all}' (default) | '\textit{t-axis}' | '\textit{y-axis}' | '\textit{none}'

Specify tick mark labels to display on time plots in the Simulation Data Inspector.

- '\textit{all}' — Display tick mark labels for both time plot axes.
- '\textit{t-axis}' — Display tick mark labels only on the $t$-axis for time plots.
- '\textit{y-axis}' — Display tick mark labels only on the $y$-axis for time plots.
- '\textit{none}' — Do not display tick mark labels.

Simulink.sdi.setTicksPosition

Topics
“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.setTicksPosition

Configure position for tick marks on time plots

Syntax

Simulink.sdi.setTicksPosition(position)

Description

Simulink.sdi.setTicksPosition(position) sets the location of tick marks on time plots in the Simulation Data Inspector according to the input, position. The function configures the Ticks setting in the Simulation Data Inspector Time Plot Settings. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area.

Examples

Configure Position for Tick Marks on Time Plots

You can use Simulink.sdi.setTicksPosition function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the Simulink.sdi.getTicksPosition function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using Simulink.sdi.snapshot with settings specified by a Simulink.sdi.CustomSnapshot object.

snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
**Hide Tick Marks on Time Plots**

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```matlab
Simulink.sdi.setTicksPosition('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

**Position Tick Marks Outside Plot Area**

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```matlab
Simulink.sdi.setTicksPosition('outside')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```
Input Arguments

position — Position for tick marks on time plots
'outside' (default) | 'inside' | 'none'

Specify the position for tick marks on time plots in the Simulation Data Inspector.

Tip Move tick marks to the inside of time plots to increase the area available to the plot area.

Example: 'inside'

Topics
“Create Plots Using the Simulation Data Inspector”

Introduced in R2019b
Simulink.sdi.snapshot

Package: Simulink.sdi

Capture contents of Simulation Data Inspector plots

Syntax

\[
\text{fig} = \text{Simulink.sdi.snapshot} \\
[\text{fig}, \text{image}] = \text{Simulink.sdi.snapshot} \\
\text{Simulink.sdi.snapshot(Name, Value)} \\
\text{Simulink.sdi.snapshot(Name, Value)} \\
\text{Simulink.sdi.snapshot(Name, Value)}
\]

Description

\[
\text{fig} = \text{Simulink.sdi.snapshot} \text{ creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle fig.}
\]

\[
[\text{fig}, \text{image}] = \text{Simulink.sdi.snapshot} \text{ creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle fig and returns the image data in the array, image.}
\]

\[
\text{Simulink.sdi.snapshot(Name, Value)} \text{ captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.}
\]

\[
\text{fig} = \text{Simulink.sdi.snapshot(Name, Value)} \text{ captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, fig, if a figure is created.}
\]

\[
[\text{fig}, \text{image}] = \text{Simulink.sdi.snapshot(Name, Value)} \text{ captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, fig, and an array of image data, image, when appropriate for the specified options.}
\]
Examples

Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the Simulink.sdi.CustomSnapshot object.

Simulate Your Model and Get a Run Object

Configure the vdp model to save output data, and run a simulation to create data.

```matlab
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```matlab
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

Modify Signal View Settings

Use the Simulink.sdi.Run object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```matlab
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

Capture a Snapshot from the Simulation Data Inspector

Create a Simulink.sdi.CustomSnapshot object and use the Simulink.sdi.snapshot function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.
snap = Simulink.sdi.CustomSnapshot;

You can use properties of the Simulink.sdi.CustomSnapshot object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a Simulink.sdi.CustomSnapshot object to create your figure, these plot settings do not affect the Simulation Data Inspector.

snap.Rows = 2;
snap.YRange = {{-2.25 2.25},[-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)

Use Simulink.sdi.snapshot to generate the figure you specified in the properties of the Simulink.sdi.CustomSnapshot object.

fig = Simulink.sdi.snapshot(“from”,”custom”,”to”,”figure”,”settings”,snap);
Copy the View Settings to a New Simulation Run

Simulate the model again, with a different \( \mu \) value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```matlab
set_param('vdp/Mu','Gain','5')
sim('vdp')
```

```matlabunIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using
Simulink.sdi.copyRunViewSettings. The Simulink.sdi.copyRunViewSettings function does not automatically update plot settings in Simulink.sdi.CustomSnapshot objects, so specify the plot input as false.

sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);

**Capture a Snapshot of the New Simulation Run**

Use the Simulink.sdi.CustomSnapshot object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

snap.clearSignals
snap.YRange = {{-2.25 2.25],[-8 8}};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside quotes. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'to', 'figure', 'props', {'Name', 'My Data'}
**from — Content to include in the snapshot**

'opened' (default) | 'active' | 'comparison' | 'custom'

Content to include in the snapshot.

- 'opened' — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- 'active' — Include only the active (selected) subplot in the open Simulation Data Inspector session.
- 'comparison' — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.
- 'custom' — Include contents specified by the settings name-value pair Simulink.sdi.CustomSnapshot object. You can use the 'from','custom' option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a settings name-value pair when you specify 'from','custom'.

Example: 'from','comparison'

Data Types: char | string

**to — Type of snapshot to create**

'image' (default) | 'figure' | 'file' | 'clipboard'

Type of snapshot to create.

- 'image' — Create a figure containing an image of the specified Simulation Data Inspector contents and return the figure handle and an array of image data. When you specify 'to','image', the fig and image outputs both have value.
- 'figure' — Replicate the specified Simulation Data Inspector contents in a MATLAB figure and return the figure handle. When you specify 'to','figure' the fig output has value, and the image output is empty.
- 'file' — Save a snapshot of the specified Simulation Data Inspector contents to a PNG file with the name specified by the filename name-value pair. If you do not specify a filename name-value pair, the file is named plots.png. When you specify 'to','file', the fig and image outputs are both empty.
- 'clipboard' — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify 'to','clipboard', the fig and image outputs are both empty.

Example: 'to','file'
Data Types: char | string

filename — Name for image file
'plots.png' (default) | character array | string

Name of the image file to store the snapshot when you specify 'to','file'.
Example: 'filename','MyImage.png'
Data Types: char | string

props — Properties to customize the figure
cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.
Example: 'props',{ 'Name','MyData' , 'NumberTitle' , 'off' }
Data Types: char | string

settings — Custom snapshot settings
Simulink.sdi.CustomSnapshot

Simulink.sdi.CustomSnapshot object specifying custom snapshot settings. You can use the settings name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the x- and y-axes.
Example: 'settings',customSnap
Data Types: char | string

Output Arguments

fig — Figure handle
figure handle

Handle for the figure. When a figure is not created with your specified options, the fig output is empty.

image — Image data
array
Array of image data. The image output has value when you use Simulink.sdi.snapshot without any input arguments or without a to name-value pair and when you specify 'to','image'.

Topics
“Inspect and Compare Data Programmatically”
“Create Plots Using the Simulation Data Inspector”

Introduced in R2018a
Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

Simulink.sdi.view

Description

Simulink.sdi.view opens the Simulation Data Inspector. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use Simulink.sdi.view to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

Simulink.sdi.view

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.
Create Data for the Run

This example creates timeseries objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```matlab
% Generate timeseries data
time = linspace(0, 20, 100);
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the create method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```matlab
% Create a run
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
sinusoidsRun.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the Simulink.sdi.Signal Object

The getSignalByIndex method returns a Simulink.sdi.Signal object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```matlab
% Get signal, modify its properties, and change Checked property to true
sine_sig = sinusoidsRun.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view

Close the Simulation Data Inspector and Save Your Data
Simulink.sdi.close('sinusoids.mat')

Alternatives
You can open the Simulation Data Inspector from the Simulink Editor toolbar with the
Simulation Data Inspector button.

Introduced in R2011b
Simulink.SimulationData.createStructOfTimeseries

Create structure of timeseries data to load as simulation input for bus

Syntax

tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsStructIn)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray)
tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray, dims)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)

Description

tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsStructIn) creates a structure with attributes that match those specified by the Simulink.Bus object, busObj, and data specified by the structure of timeseries objects, tsStructIn.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create a simulation input that fully or partially specifies the data for a bus. You can also use this syntax to rename the structure elements to match the names in the Simulink.Bus object.

tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray) creates a structure of timeseries objects with attributes that match those specified by the Simulink.Bus object, busObj, and data specified by the cell array of timeseries objects, tsCellArray.
When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create simulation input that fully or partially specifies the data for a bus using a flat list of timeseries objects. The function maps the timeseries objects to the hierarchy specified by the Simulink.Bus object using a depth-first search.

```matlab
tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj,tsCellArray,dims)
```
does an array of timeseries structures where the attributes of each structure match those defined by the Simulink.Bus object, `busObj` with the data specified by the cell array of timeseries objects, `tsCellArray`. The input `dims` specifies the dimensions of the array.

```matlab
tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)
```
does a structure of timeseries objects from the bus data stored in the Simulink.TsArray object, `tsArray`. In versions before R2016a, signal logging creates Simulink.TsArray objects to store logged bus data. Use this syntax when you want to use bus data logged in a release before R2016a using ModelDataLogs format as simulation input.

## Examples

### Use Logged Bus Data as Simulation Input

You can use the `Simulink.SimulationData.createStructOfTimeseries` function to create structures of timeseries objects to use as simulation input for bus signals. This example shows you how to create a structure of timeseries to load into a model using timeseries data logged from a different simulation.

### Create a Structure of Timeseries

Open the `ex_log_structtimeseries` model.

```matlab
open_system('ex_log_structtimeseries')
```
The model uses Constant blocks and Bus Creator blocks to build two buses, `bus1` and `bus2`, with signals `a`, `b`, `c`, and `d`. The model uses signal logging to log the bus data. Create bus data by simulating the model.

```matlab
out = sim('ex_log_structtimeseries');
```

```matlab
logsout = out.logsout
```

```matlab
logsout =
Simulink.SimulationData.Dataset 'logsout' with 2 elements
```

<table>
<thead>
<tr>
<th>Name</th>
<th>BlockPath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[1x1 Signal]  <code>bus1</code>  <code>ex_log_structtimeseries/Bus Creator</code></td>
</tr>
<tr>
<td>2</td>
<td>[1x1 Signal]  <code>bus2</code>  <code>ex_log_structtimeseries/Bus Creator1</code></td>
</tr>
</tbody>
</table>
- Use braces {} to access, modify, or add elements using index.

You can use the get function to select the Simulink.SimulationData.Signal object for bus2. The bus data is in the Values property of the Simulink.SimulationData.Signal object. The data representing bus2 is logged in a structure containing timeseries objects named c and d.

```matlab
logout.get(2).Values
```

```matlab
ans =
    struct with fields:
        c: [1x1 timeseries]
        d: [1x1 timeseries]
```

**Loading Model Configuration**

Open the `ex_load_structtimeseries` model, which uses the logged simulation data as input.

```matlab
open_system('ex_load_structtimeseries')
```

![Diagram of the model](image)

The model uses the InBus Import block to load input bus data. A Bus Selector block chooses signals from the bus to display on Display blocks.

Double-click the InBus block and check its **Data type** on the **Signal Attributes** tab of the dialog. The data type is specified by a Simulink.Bus object called `bus`. 
Close the dialog and open the Model Explorer. On the **Callbacks** tab, you can see the model uses its `PreLoadFcn` to define the `Simulink.Bus` object that defines the data type for the Inport block.

Open the Configuration Parameters and view the specification for the **Input** parameter on the **Data Import/Export** pane. The model uses the variable `inputBus` for its **Input**.

**Create Simulation Input from the Structure of timeseries Data**

To load the data logged for `bus1`, you only need to assign the structure data to the **Input** variable for the model.

```matlab
inputBus = logsout.get(1).Values
```

```matlab
inputBus =

    struct with fields:
        a: [1x1 timeseries]
        b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 1 and 2 logged in `bus1` and loaded into the model.

To load the data logged for `bus2`, you need to use the `Simulink.Bus` object that defines the Inport block data type and `Simulink.SimulationData.createStructOfTimeseries` to create a structure of timeseries with names specified by the `Simulink.Bus` object.

```matlab
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',...
  logsout.get(2).Values)
```
inputBus =

    struct with fields:
        a: [1x1 timeseries]
        b: [1x1 timeseries]

When you simulate the model, the Display blocks show the values 3 and 4 logged in bus2 and loaded into the model.

**Partially Specify Simulation Input for a Bus**

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to create partially specified simulation input for a bus. This example logs data from `ex_log_structtimeseries` and then loads that data into `ex_load_structtimeseries`.

**Create timeseries Data**

First, open and simulate the `ex_log_structtimeseries` model. The model logs two bus signals, bus1 and bus2, created using Constant blocks and Bus Creator blocks. Access the `logssout Dataset` in the `Simulink.SimulationOutput` object, out.

```matlab
open_system('ex_log_structtimeseries')
out = sim('ex_log_structtimeseries');

logssout = out.logssout;
```
You can use a structure of `timeseries` data or a cell array of `timeseries` data to partially specify simulation input for a bus.

**Partially Specify Bus Data with a Structure of `timeseries` Data**

Open the model `ex_load_structtimeseries` that will load some of the data you logged in the previous section.

```matlab
open_system('ex_load_structtimeseries')
```

Use the `get` function to access the structure of `timeseries` data logged for `bus1`.

```matlab
bus1 = logsout.get(1).Values;
```
Then, replace the \( b \) data with \([]\).

\[
\text{bus1.b} = []; \\
\]

The \texttt{ex_load_structtimeseries} model uses the variable \texttt{inputBus} as its \texttt{Input}. The \texttt{Simulink.Bus} object, \texttt{bus}, that defines the data type for the Inport block is defined in the \texttt{PreLoadFcn} callback for the \texttt{ex_load_structtimeseries} model. Because the signal names in \texttt{bus1} match the \texttt{Simulink.Bus} object specification for the Inport block in the \texttt{ex_load_structtimeseries} model, you can use the logged structure without modification. To load the data for \texttt{bus1}, assign \texttt{bus1} to the variable \texttt{inputBus}.

\[
\text{inputBus} = \text{bus1}; \\
\]

Simulate the model. The Display blocks show the logged value 1 for \( a \) and 0 for \( b \). The simulation uses ground values when you do not specify data for the signal.

\[
\text{loadOut} = \text{sim}('ex_load_structtimeseries'); \\
\]

Now, load the data logged for \texttt{bus2}. The signal names in \texttt{bus2} do not match the \texttt{Simulink.Bus} object specification for the Inport block in the \texttt{ex_load_structtimeseries} model. Modify the data in the structure to partially specify input data for the bus. Then, use the \texttt{Simulink.SimulationData.createStructOfTimeseries} function to change the names in the structure to match the bus specification.

\[
\text{bus2} = \text{logsout.get}(2).\text{Values}; \\
\text{bus2.d} = []; \\
\text{inputBus} = \text{bus2}; \\
\text{inputBus} = \text{Simulink.SimulationData.createStructOfTimeseries}('bus',\text{inputBus}); \\
\]

Simulate the model. The Display blocks show the logged value 3 for \( a \) and 0 for \( b \).

\[
\text{loadOut} = \text{sim}('ex_load_structtimeseries'); \\
\]

**Partially Specify Bus Data with a Cell Array of Timeseries Data**

When you have timeseries data, you can use \texttt{Simulink.SimulationData.createStructOfTimeseries} to partially specify simulation input for a bus using a cell array of the timeseries data. Load the timeseries data for signal \( d \) in \texttt{bus2} as part of a partial bus specification for the Inport block in the \texttt{ex_load_structtimeseries} model. The \texttt{PreLoadFcn} callback for the \texttt{ex_load_structtimeseries} model defines the \texttt{Simulink.Bus} object, \texttt{bus}, that defines the data type for the Inport block.
d = logsout.get(2).Values.d;

inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',
    {d,[]});

Simulate the model. The Display block for signal a in the ex_load_structtimeseries
model shows the data logged in signal d from the ex_log_structtimeseries model.
The Display block for signal b shows 0.

loadOut = sim('ex_load_structtimeseries');

Load Simulation Input Data for an Array of Buses

This example shows how to use the Simulink.SimulationData.createStructOfTimeseries function to generate simulation input for an array of buses. You create timeseries data by simulating one model. Then, you create an input structure using the logged data to load into an array of buses in another model.

Create timeseries Data

To start, open the ex_log_structtimeseries model.

open_system('ex_log_structtimeseries')
The model creates two buses, `bus1` and `bus2`, using Constant blocks and Bus Creator blocks. The signals are named `a`, `b`, `c`, and `d`. Create logged bus data by simulating the model.

```matlab
out = sim('ex_log_structtimeseries');
```

The output `out` contains a `Simulink.SimulationData.Dataset` object, `logsout`, with the logged data. You can access the `bus1` and `bus2` signals using the `get` function. The data for each signal is in the `Simulink.SimulationData.Signal` object `Values` parameter. You can access the bus elements using a dot followed by the signal name. `bus1` is the first signal in the `Dataset` object and contains signals `a` and `b`. `bus2` contains signals `c` and `d`.

```matlab
logsout = out.logsout;

a = logsout.get(1).Values.a;
b = logsout.get(1).Values.b;
c = logsout.get(2).Values.c;
d = logsout.get(2).Values.d;
```
**Loading Model Configuration**

Open the model `ex_structtimeseries_aob`, which uses an array of buses as input.

```matlab
open_system('ex_load_structtimeseries_aob')
```

The model uses the `InAoB` Inport block to load simulation input. Selector blocks select a bus from the array of buses, and Bus Selector blocks select signals to show in the Display blocks.

Double-click the `InAoB` block and look at the **Signal Attributes** pane of the dialog. The **Data type** for the block is set to **Bus** with the type defined by the `Simulink.Bus` object, `bus`. The **Port dimensions** parameter is set to `[2 1]`.

You can see the definition for the `Simulink.Bus` object, `bus`, in the **Callbacks** tab in the Model Explorer. This model uses the `PreLoadFcn` to define the bus object.

Open the Model Configuration Parameters and look at the **Input** parameter. The model uses the variable `inputAoB` as input.

**Create Array of Buses Simulation Input**

Use `Simulink.SimulationData.createStructOfTimeseries` and the data logged in the first section to create a structure to load as simulation input for the array of buses. Specify the dimensions as `[2 1]` to match the dimensions of the `InAoB` block.

```matlab
inputAoB = Simulink.SimulationData.createStructOfTimeseries('bus',... {a,b,c,d},[2 1]);
```
When you simulate the model, the Display blocks show the data for signals a, b, c, and d logged from the ex_log_structtimeseries model. The array of buses contains two buses with signals a and b. Simulink.SimulationData.createStructOfTimeseries renamed signals c and d to match the Simulink.Bus specification used by the array of buses.

inputAoB(2)

ans =

struct with fields:
   a: [1x1 timeseries]
   b: [1x1 timeseries]

Simulate the model. The display blocks show the logged values.

aob_out = sim('ex_load_structtimeseries_aob');

Create a Structure of timeseries Objects from a Simulink.TSArray Object

In releases before R2016a, when you log simulation data using ModelDataLogs format, bus data is stored as a Simulink.TSArray object. You cannot log data using ModelDataLogs format using a release after R2016a. In this example, the logged data, logsout, was logged in ModelDataLogs format using a release before R2016a. The variable logsout contains data for a single bus, bus1.

logsout

logsout =

Simulink.ModelDataLogs (log_modeldatalog):  
   Name                     Elements  Simulink Class
   bus1                      2        TsArray

To load the logged data as simulation input for a bus, create a structure of timeseries objects from the data in bus1.

struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)
struct_of_ts =
    const1_sig: [1x1 timeseries]
    const2_sig: [1x1 timeseries]

Input Arguments

busObj — Name of Simulink.Bus object
character vector

Name of the Simulink.Bus object that specifies the attributes for the data in the output structure of timeseries objects. When you want to load the structure of timeseries objects as simulation input for a bus, the busObj is the bus that defines the data type for the root-level Inport block.

Simulink.SimulationData.createStructOfTimeseries validates the input timeseries attributes including data type and complexity against the Simulink.Bus object specification. When element names do not match between the Simulink.Bus specification and the input timeseries data, Simulink.SimulationData.createStructOfTimeseries renames the timeseries data to match the bus specification. When other attributes do not match, the function returns an error.

Example: 'MyInputBus'

tsStructIn — Structure of timeseries objects
structure of timeseries data

Structure of timeseries data for use in creating the output structure of timeseries objects according to the Simulink.Bus object. The structure must have the same hierarchy as the Simulink.Bus object.

To partially specify data for a bus, use [] in the place of the bus element you want to use ground values.

tsCellArray — Cell array of timeseries objects
cell array of timeseries objects

Cell array of timeseries objects specifying the data for the output structure of timeseries objects.
To partially specify data for a bus, use [] in the place of the bus element you want to use ground values.

The `Simulink.SimulationData.createStructOfTimeseries` function maps the `timeseries` elements of the cell array to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

Example: `{ts1,ts2,ts3}`
Example: `{ts1,[],ts3}`

**Dependencies**

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

**dims — Dimensions for output array**

vector

Dimensions for the array of `timeseries` structures, specified as a vector.

When you specify the dimensions as a scalar, n, the function creates a 1-by-n array.

Example: `[2,1]`

**Dependencies**

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

Data Types: double

**tsArray — Simulink.TsArray object**

Simulink.TsArray

`Simulink.TsArray` object.

In versions prior to R2016a, signal logging creates `Simulink.TsArray` objects to store logged bus data. Use this syntax when you want to use data logged using `ModelDataLogs` format in a version before R2016a to create simulation input for a bus.

Example: `myTsArrayObj`
Output Arguments

tsStruct — Structure of timeseries objects
struct

Structure of timeseries objects with attributes specified by the Simulink.TsArray or Simulink.Bus input. You can load the structure of timeseries objects as simulation input for a bus.

tsStructArray — Array of timeseries structures
array

Array of structures of timeseries objects with dimensions specified by the dims input.

Topics
“Load Data to Root-Level Input Ports”
“Load Bus Data to Root-Level Input Ports”

Introduced in R2013a
getAsDatastore

**Class:** Simulink.SimulationData.DatasetRef  
**Package:** Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

**Syntax**

```verbatim
element = Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

**Description**

```verbatim
element = Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements) returns a matlab.io.datastore.SimulationDatastore representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a Dataset element as a matlab.io.datastore.SimulationDatastore object if the element was placed into the MAT-file using either of these approaches:

- Log Dataset format data to persistent storage (MAT-file).
- Place the element into a Simulink.SimulationData.Dataset object and saved the Dataset object to a v7.3 MAT-file.

The SimulationDatastore representation for a Dataset element creates a SimulationDatastore object for the Values field of that element. The SimulationDatastore representation supports streaming of the data for the Values property of the element into other simulations or into MATLAB.
```
**Note** You cannot use create a `SimulationDatastore` for `Dataset` elements that contain these types of data:

- Array

You can use `SimulationDatastore` objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

### Input Arguments

**datasetref_element** — Element of referenced dataset in MAT-file  

index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector).

### Output Arguments

**element** — Element accessed using `SimulationDatastore` object  

`matlab.io.datastore.SimulationDatastore` object | `Simulink.SimulationData.Signal`, `Simulink.SimulationData.State` or similar object, whose Values data uses a `matlab.io.datastore.SimulationDatastore` object

Element accessed using `SimulationDatastore` object, returned as either a `matlab.io.datastore.SimulationDatastore` object or a `Simulink.Signal`, `Simulink.State`, or similar object, whose Values data uses a `matlab.io.datastore.SimulationDatastore` object.

### Examples
Use a SimulationDatastore to Reference a Signal’s Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a DatasetRef for the signal logging Dataset data (logsout) in the out.mat MAT-file.

```matlab
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef.getAsDatastore(1)
```

```matlab
count = 0;
while count < 100
    sim('my_model', 'ExternalInput', ds);
end
```

Alternative

To streamline the use of indexing, you can use curly braces ({{}}) syntax to obtain a SimulationDatastore object for DatasetRef object signal values. The requirements and results are the same as using `getAsDatastore` for example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```matlab
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logsout');
firstSig = sigLogRef{1}
```

```matlab
ans =
```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:

Name: 'x1'
PropagatedName: ''
BlockPath: [1x1 Simulink.SimulationData.BlockPath]
PortType: 'outport'
PortIndex: 1
Values: [1×1 matlab.io.datastore.SimulationDatastore]

“Load Big Data for Simulations”

Introduced in R2017a
Simulink.SimulationData.DatasetRef.getDatasetVariableNames

List names of Dataset variables in MAT-file

Syntax

varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)

Description

varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
lists the names of variables for Dataset data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the Configuration Parameters > Data Import/Export > Log Dataset data to file and use the default MAT-file name of out.mat.

List the variable names in the MAT-file.

varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
varNames =
    'xout'    'logsout'

**Tips**

To get the names of Dataset variables in the MAT-file, using the Simulink.SimulationData.DatasetRef.getDatasetVariableNames function processes faster than using the who, or whos functions.

**Input Arguments**

matFile — MAT-file that contains Dataset variables  
character vector  

MAT-file that contains Dataset variables, specified as a character vector. The character vector specifies the path to the MAT-file.

**Output Arguments**

varNames — Names of Dataset variables in MAT-file  
cell array  

Names of Dataset variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each timeseries object

Syntax

dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,inputData)

Description

dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,inputData) runs the specified function handle on all MATLAB timeseries objects contained in inputData.

Examples

Find Minimum for Logged Bus Signal Data

This example shows how to use the forEachTimeseries function to run the min function on each timeseries object in the logged data for the COUNTERBUS signal.

Open the model and simulate it.

code:
```matlab
open_system('sldemo_mdlref_bus')
sim('sldemo_mdlref_bus');
```
Access the signal logging data. For this model, that data is stored in the `topOut` variable.

```matlab
topOut
Simulink.SimulationData.Dataset 'topOut' with 4 elements
```

<table>
<thead>
<tr>
<th>Name</th>
<th>BlockPath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 [1x1 Signal]</td>
<td>COUNTERBUS sldemo.mdlref_bus/Concatenate</td>
</tr>
<tr>
<td>2 [1x1 Signal]</td>
<td>OUTERDATA sldemo.mdlref_bus/CounterA</td>
</tr>
<tr>
<td>3 [1x1 Signal]</td>
<td>INCREMENTBUS sldemo.mdlref_bus/IncrementBusCreator</td>
</tr>
<tr>
<td>4 [1x1 Signal]</td>
<td>INNERDATA ...erA sldemo.mdlref_counter_bus/COUNTER</td>
</tr>
</tbody>
</table>

- Use braces `{ }` to access, modify, or add elements using index.

Find the values for the COUNTERBUS element.

```matlab
counterbusData = topOut{1}.Values
counterbusData =
2x1 struct array with fields:
```
Run the \texttt{min} function on the \texttt{counterbus} data.

\begin{verbatim}
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)
ret =
2x1 struct array with fields:
  data
  limits

Explore the returned data.

ret(1)
ans =
  data: 0
  limits: [1x1 struct]

ret(2).limits
ans =
  upper_saturation_limit: 40
  lower_saturation_limit: 0
\end{verbatim}

**Input Arguments**

\texttt{functionHandle} — Function to run on MATLAB timeseries objects

\begin{verbatim}
function handle
\end{verbatim}

Function to run on \texttt{timeseries} objects, specified as a function handle. For information about specifying function handles, see “Pass Function to Another Function” (MATLAB).

The function that you use with \texttt{forEachTimeseries}:

- Can be either a built-in function or a user-specified function
- Must return a scalar

If the function that you use with \texttt{forEachTimeseries} takes:
• One argument, specify the function handle and the input data. For example:

```matlab
ret = Simulink.SimulationData.forEachTimeseries(@min,data);
```

• More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB timeseries objects in `data`, for the time vector `[2.5 3]`.

```matlab
ret = Simulink.SimulationData.forEachTimeseries(@(x)... (resample(x,[2.5 3]),data);
```

**inputData — Data to run specified function on**
MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data to run specified function on, specified as timeseries data.

**Output Arguments**

**dataResults — Data resulting from running specified function**
MATLAB timeseries object | array of timeseries | structure with timeseries at leaf nodes | array of structures with timeseries at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

Introduced in R2016b
Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

Simulink.SimulationData.signalLoggingSelector(modelName)

Description

Simulink.SimulationData.signalLoggingSelector(modelName) opens the Signal Logging Selector dialog box for the model that you specify with modelName.

Input Arguments

modelName

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for the sldemo_mdlref_bus.mdl.

Simulink.SimulationData.signalLoggingSelector('sldemo_mdlref_bus')

Topics

“Override Signal Logging Settings”
Introduced in R2011a
**setName**

**Class:** Simulink.SimulationData.Unit  
**Package:** Simulink.SimulationData

Specify name of logging data units

**Syntax**

unitObject = setName(unitObj,unitName)

**Description**

unitObject = setName(unitObj,unitName) sets the name for the Simulink.SimulationData.Unit object to the name specified in unitName.

**Input Arguments**

unitObj — Logging data unit object to name  
Simulink.SimulationData.Unit object

Logging data unit object to name, specified as a Simulink.SimulationData.Unit object.

unitName — Name of logging data unit  
character vector

Name of logging data unit, specified as a character vector.

**Output Arguments**

name — Name of logging data units  
character vector

Name of logging data units, returned as a character vector.
Examples

Name a Logging Data Unit Object

```matlab
inchesUnit = Simulink.SimulationData.Unit('in');
inchesUnit = setName(inchesUnit,'inches')

inchesUnit =
    Units with properties:
        Name: 'inches'
```

Introduced in R2011a
Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use Dataset format for signal logging

Syntax

Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)

Description

**Note** The ModelDataLogs class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the ModelDataLogs format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used ModelDataLogs format, the model simulated in use Dataset format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses Dataset format for all signal logging.

You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the ModelDataLogs API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy ModelDataLogs API”.

Simulink.SimulationData.updateDatasetFormatLogging(top_model) converts the top-level model and all of its referenced models to use the Dataset format for signal logging instead of the ModelDataLogs format. You can convert signal logging data from ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to
post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If a Model block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the Dataset signal logging format. For details about the `variants` argument, see “Input Arguments” on page 2-1042.

**Input Arguments**

**top_model**
Character vector that specifies the name of the top-level model.

**variants**
Character vector that specifies which variant models to update:
- 'ActivePlusCodeVariants' — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- 'ActiveVariants' — Convert only the active variant.
- 'AllVariants' — Convert all variants.

**More About**

**Dataset**

The **Dataset** format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The Dataset format use MATLAB `timeseries` objects to formatting the data.
ModelDataLogs

The ModelDataLogs format causes Simulink to use a Simulink.ModelDataLogs object to store the logged signal data. Simulink.Timeseries and Simulink.TsArray objects provide the format for the data.

Tips

• The conversion function sets the SignalLoggingSaveFormat parameter value to Dataset for all the updated models.
• If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.
• If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.
• If you use this function for a model that does not include any referenced models, the function converts the top-level model use the Dataset format.

Topics

“Migrate Scripts That Use Legacy ModelDataLogs API”

Introduced in R2011a
find

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

\[ output = \text{simOut}.\text{find}('VarName') \]

Description

\[ output = \text{simOut}.\text{find}('VarName') \] accepts one variable name. Specify \textit{VarName} inside single quotes.

Input Arguments

\begin{itemize}
  \item \textit{VarName}
\end{itemize}

Name of logged variable for which you seek values.

Default:

Output Arguments

\begin{itemize}
  \item \textit{Value}
\end{itemize}

Value of the logged variable name specified in input.
Examples

Simulate \texttt{vdp} and store the values of the variable \texttt{youtNew} in \texttt{yout}.

\begin{verbatim}
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  'SaveState','on','StateSaveName','xoutNew',...  'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.find('youtNew')
\end{verbatim}

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the \texttt{xoutNew} output variable, you can use this command:

\begin{verbatim}
simOut.xoutNew
\end{verbatim}

Another alternative is to use \texttt{Simulink.SimulationOutput.who} and then \texttt{Simulink.SimulationOutput.get}.

See Also

\texttt{Simulink.SimulationOutput.get} | \texttt{Simulink.SimulationOutput.who}
get

Class: Simulink.SimulationOutput
Package: Simulink

Access and display values of simulation results

Syntax

$output = 
\text{simOut.}
.get('VarName')$

Description

$output = 
\text{simOut.}
.get('VarName')$ accepts one variable name. Specify $VarName$
inside single quotes.

Tip A simpler alternative to using the get function is to use dot notation. For example, to
access data for the $xout$ output variable, you can use this command:

\text{simOut.xout}

Input Arguments

$VarName$

Name of logged variable for which you seek values.

Default:
Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate vdp and store the values of the variable youtNew in yout.

```matlab
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  'SaveState','on','StateSaveName','xoutNew',...  'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative is to use dot notation. For example, to access data for the xout output variable, you can use this command:

```matlab
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also

`Simulink.SimulationOutput.who` | `Simulink.SimulationOutput.find`
getSimulationMetadata

**Class:** Simulink.SimulationOutput  
**Package:** Simulink

Return SimulationMetadata object for simulation

**Syntax**

```matlab
mData = simout.getSimulationMetadata()
```

**Description**

`mData = simout.getSimulationMetadata()` retrieves metadata information in a SimulationMetadata object from the `simout` SimulationOutput object.

**Input Arguments**

- `simout` — Simulation object to get metadata from
  
  Simulation object to get metadata from, specified as a `SimulationOutput` object.

**Output Arguments**

- `mData` — SimulationMetadata object stored in the `simout` SimulationOutput object
  
  SimulationMetadata object stored in the `simout` SimulationOutput object, returned as an object.
Examples

Retrieve Metadata From vdp Simulation

Simulate the vdp model and retrieve metadata information from the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout

```matlab
open_system('vdp')
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```
Retrieve metadata information about this simulation using `mData`.

```
 mData=simout.getSimulationMetadata()
```

```
 mData =
 SimulationMetadata with properties:
    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
```
Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```plaintext
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the **SimulationMetadata** object.

See Also

- `Simulink.SimulationMetadata`
- `Simulink.SimulationOutput.setUserData`
- `Simulink.SimulationOutput.setUserString`
setUserData

**Class:** Simulink.SimulationOutput  
**Package:** Simulink

Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains

**Syntax**

```matlab
simoutNew = simout.setUserData(CustomData)
```

**Description**

`simoutNew = simout.setUserData(CustomData)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomData` in its `SimulationMetadata` object.

**Input Arguments**

- **`simout`** — *Simulation object to get metadata from*  
  Simulation object to get metadata from, specified as a `SimulationOutput` object.

- **`CustomData`** — *Data to store in a metadata object*  
  Any custom data you want to store in the metadata object.

**Output Arguments**

- **`simoutNew`** — *Simulation object that stores metadata object with custom data*  
  The output `SimulationOutput` object containing `CustomData` in its `SimulationMetadata` object.
A copy of the simout SimulationOutput object that contains CustomData in its SimulationMetadata object, returned as an object.

Examples

Store Data in SimulationMetadata Object of vdp Simulation

Simulate the vdp model. Store custom data in the SimulationMetadata object that the SimulationOutput object contains.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```matlab
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```
Store custom data about the simulation in the `SimulationMetadata` object that `simout` contains.

\[
\text{simout}=\text{simout}.\text{setUserData}(
\text{struct('param1','value1','param2','value2','param3','value3'))}
\]

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

\[
\text{mData}=\text{simout}.\text{getSimulationMetadata}();
\text{disp(mData.UserData)}
\]

```
    param1: 'value1'
    param2: 'value2'
```
param3: 'value3'

Simulink.SimulationMetadata|
Simulink.SimulationOutput.getSimulationMetadata|
Simulink.SimulationOutput.setUserString
setUserString

Class: Simulink.SimulationOutput
Package: Simulink

Store custom character vector in SimulationMetadata object that SimulationOutput object contains

Syntax

simoutNew = simout.setUserString(CustomString)

Description

simoutNew = simout.setUserString(CustomString) assigns a copy of the simout SimulationOutput object to simoutNew. The copy contains CustomString in its SimulationMetadata object.

Input Arguments

simout — Simulation object to get metadata from object

Simulation object to get metadata from, specified as a SimulationOutput object.

CustomString — Character vector to store in a metadata object character vector

Any custom character vector you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom character vector object
A copy of the `simout` SimulationOutput object that contains CustomString in its SimulationMetadata object, returned as an object.

**Examples**

**Store a Character Vector in SimulationMetadata Object of vdp Simulation**

Simulate the `vdp` model. Store a custom character vector in the SimulationMetadata object that the SimulationOutput object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

```matlab
open_system('vdp')
simout = sim(bdroot,'ReturnWorkspaceOutputs','on');
```

---

Copyright 2004-2013 The MathWorks, Inc.
Store a character vector to describe the simulation.

simout=simout.setUserString('First Simulation');

Use SimulationOutput.getSimulationMetadata to retrieve the information you stored.

mData=simout.getSimulationMetadata();
disp(mData.UserString)
First Simulation

who

Class: Simulink.SimulationOutput  
Package: Simulink

Access and display output variable names of simulation

Syntax

simOutVar = simOut.who

Description

simOutVar = simOut.who returns the names of all simulation output variables, including workspace variables.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```plaintext
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
             'SaveState','on','StateSaveName','xoutNew',...  
             'SaveOutput','on','OutputSaveName','youtNew');
simOutVar = simOut.who
```

2-1060
Alternatives

A simpler alternative is to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

`simOut.xoutNew`

`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.get`
Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true)

[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs)
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs,Name,Value)

Description

Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true) opens the Model Reference Conversion Advisor for the currently selected subsystem block.

[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs) converts the specified subsystems to referenced models using the mdlRefs value.

For each subsystem that the function converts, it:

• Creates a model
• Copies the contents of the subsystem into the new model
• Updates any root-level Inport, Outport, Trigger, and Enable blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem
• Copies the contents of the model workspace of the original model to the new model

Before you use the function, load the model containing the subsystem.
[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys,mdlRefs,Name,Value) uses additional options specified by one or more Name,Value pair arguments.

Examples

Open the Model Reference Conversion Advisor

Open the f14 model.

open_system('f14');

In the f14 model, select the Controller subsystem output signal, click the Simulation Data Inspector button arrow, and select Log Selected Signals.

In the Simulink Editor, select the Controller subsystem. Then open the Model Reference Conversion Advisor from the command line.

Simulink.SubSystem.convertToModelReference(gcb,'UseConversionAdvisor',true);

Perform the conversion using the advisor.

Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named bus_counter_ref_model.

open_system('sldemo_mdlref_conversion');
Simulink.SubSystem.convertToModelReference(...
    'sldemo_mdlref_conversion/Bus Counter', ...
    'bus_counter_ref_model', ...
    'AutoFix',true,...
    'ReplaceSubsystem',true,...
    'CheckSimulationResults',true);

### Successfully converted Subsystem to Model reference block
Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```matlab
open_system('f14');
set_param(gcs,'SaveOutput','on','SaveFormat','Dataset');
set_param(gcs,'SignalResolutionControl','UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
    {'f14/Controller','f14/Aircraft Dynamics Model'},...
    {'controller_ref_model','aircraft_dynamics_ref_model'},...
    'ReplaceSubsystem',true,...
```
Input Arguments

**subsys** — Subsystems to convert
character vector | subsystem handle | cell array of character vectors | array of subsystem handles

Subsystems to convert, specified as a character vector, subsystem handle, or cell array of strings or array of subsystem handles.

For information on which subsystems you can convert, see “Modify Referenced Models for Conditional Execution”.

Data Types: double

**mdlRefs** — Referenced model names
character vector | cell array of character vectors

Referenced model names, specified as a character vector or cell array of character vectors. Each model name must be 59 characters or less.

If you specify a cell array of subsystems to convert, specify a cell array of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Name-Value Pair Arguments

Specify optional comma-separated pairs of **Name,Value** arguments. **Name** is the argument name and **Value** is the corresponding value. **Name** must appear inside quotes. You can specify several name and value pair arguments in any order as **Name1,Value1,...,NameN,ValueN**.

Example: `Simulink.SubSystem.convertToModelReference... (engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

**AutoFix** — Fix all conversion issues that can be fixed automatically
false (default) | true

If you set **AutoFix** to **true**, the function fixes all conversion issues that it can fix.
For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

**Note** If you set 'Force' to true, then the function does not automatically fix conversion issues.

Data Types: logical

**Force — Complete conversion even with errors**
false (default) | true

If you set 'Force' to true, the function returns conversion errors as warnings and continues with the conversion without fixing the errors. This option allows you to use the function to do the initial steps of conversion and then complete the conversion process yourself.

If you set Force to true, then the function does not fix conversion issues, even if you set 'AutoFix' to true. However, the success output argument is true, regardless of whether any conversion errors occurred.

**CheckSimulationResults — Compare simulation results before and after conversion**
false (default) | true

Compare simulation results before and after conversion, specified as true or false.

Before performing the conversion, enable signal logging for the subsystem output signals of interest in the model.

For the Simulink.SubSystem.convertToModelReference command, set:

- 'CheckSimulationResults' to true
- 'AbsoluteTolerance'
- 'RelativeTolerance'
- 'SimulationModes' to the same as the simulation mode as in the original model

If the difference between simulation results exceeds the tolerance level, the function displays a message.
**AbsoluteTolerance — Absolute signal tolerance for comparison**

'1e-06' (default) | double

Absolute signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: double

**RelativeTolerance — Relative signal tolerance for comparison**

'1e-06' (default) | double

Relative signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to `true`.

Data Types: double

**DataFileName — Name of file for storing conversion data**

character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a .m file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus _conversion_data.mat.

**ReplaceSubsystem — Replace content of each subsystem with Model blocks**

false (default) | true

Replace subsystem blocks with Model blocks, specified as true or false. The Model block references the referenced model.

By default, the function displays the referenced models in separate Simulink Editor windows.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.
• If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
• If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: logical

CreateWrapperSubsystem — Insert wrapper subsystem to preserve model layout
false (default) | true

Insert wrapper subsystem to preserve model layout, specified as true or false. When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of a model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: logical

SimulationModes — Simulation mode for Model blocks
'Normal' (default) | 'Accelerator'

Simulation mode for Model blocks, specified as a 'Normal' or 'Accelerator'. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

BuildTarget — Model reference targets to generate
'Sim' | 'Coder'

Model reference targets to generate.
• 'Sim' — Model reference simulation target
• 'Coder' — Code generation target

Output Arguments

success — Conversion status
1 | 0
Conversion status. A value of 1 indicates a successful conversion.

If you set 'Force' to true, the function returns a value of 1 if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

mdlRefBlkHs — Handles of created Model blocks

`handle of Model block | array of handles of Model blocks`

Handles of created Model blocks, returned as a double or cell array.

Data Types: double

**Tips**

- You cannot convert a parent subsystem and a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time, compared to converting each subsystem separately. The multiple subsystem conversion process compiles the model once.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
  - In the input arguments, setting 'Autofix', 'ReplaceSubsystem', and 'CheckSimulationResults' to true.
  - In the model, setting a short simulation time.
- A data dictionary saves bus objects that it creates as part of the conversion process when both of these conditions exist:
  - The top model uses a data dictionary.
  - All changes to the top model are saved.
- To maintain the behavior of a masked subsystem, perform these additional tasks:
  - For masked callbacks, icons, ports, and documentation, create a backup copy of the masked subsystem before converting it to a referenced model. After conversion, copy the content from the Mask Editor of the backup masked subsystem to the Mask Editor of the new Model block.
• Replace mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”).

**Note** Referenced models do not support the functionality that you can achieve with mask initialization code to create masked parameters.

### Compatibility Considerations

'BuildTarget' argument value 'RTW' is not recommended

*Not recommended starting in R2019a*

In R2019a, an argument value used with the `Simulink.SubSystem.convertToModelReference` function was updated. The legacy argument value is supported for backward compatibility.

To take advantage of the updated 'BuildTarget' argument value, use 'Coder' instead of 'RTW'.

**Introduced in R2006a**
Simulink.SubSystem.copyContentsToBlockDiagram

Copy contents of subsystem to empty block diagram

Syntax

Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)

Description

Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag) copies the contents of the subsystem subsys to the block diagram bdiag. The subsystem and block diagram must have already been loaded. The subsystem cannot be part of the block diagram. The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets.

This function cannot be used if the destination block diagram contains any blocks or signals. Other types of information can exist in the destination block diagram and are unaffected by the function. Use Simulink.BlockDiagram.deleteContents if necessary to empty the block diagram before using Simulink.SubSystem.copyContentsToBlockDiagram.

Tip  To flatten a model hierarchy by expanding the contents of a subsystem to the system that contains that subsystem, do not use the Simulink.SubSystem.copyContentsToBlockDiagram function. Instead, expand the subsystem, as described in “Expand Subsystem Contents”.

Input Arguments

subsys

Subsystem name or handle
bdiag
Block diagram name or handle

Examples
Copy the graphical contents of f14/Controller, including all nested subsystems, to a new block diagram:

% open f14
open_system('f14');

% create a new model
newbd = new_system;
open_system(newbd);

% copy the subsystem
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', newbd);

% close f14 and the new model
close_system('f14', 0);
close_system(newbd, 0);

“Expand Subsystem Contents”

Introduced in R2007a
**Simulink/SubSystem.deleteContents**

Delete contents of subsystem

**Syntax**

Simulink/SubSystem.deleteContents(subsys)

**Description**

Simulink/SubSystem.deleteContents(subsys) deletes the contents of the subsystem subsys. The function affects only blocks, lines, and annotations. The subsystem must have already been loaded.

**Note** This function does not delete library blocks in a subsystem.

**Input Arguments**

subsys

Subsystem name or handle

**Examples**

Delete the graphical contents of Controller, including all nested subsystems:

load_system('f14');
Simulink/SubSystem.deleteContents('f14/Controller');

Introduced in R2007a
Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

[checksum,details] = Simulink.SubSystem.getChecksum(subsys)

Description

[checksum,details] = Simulink.SubSystem.getChecksum(subsys) returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note Simulink.SubSystem.getChecksum compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command, model([], [], [], 'compile') to place the model in a compiled state before using Simulink.SubSystem.getChecksum.

This command accepts the argument subsys, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples
Run getChecksum on Model

Run the function Simulink.SubSystem.getChecksum on the model rtwdemo_ssreuse. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model rtwdemo_ssreuse.

rtwdemo_ssreuse

Select subsystem SS1 and execute the following line of code in the MATLAB editor to get the full name and path to the subsystem SS1:

path_ss1 = gcb

Run the function getChecksum on the subsystem with the following command:

[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)

The output structures chksum1 and chksum1_details will store the output of the getChecksum function call.

chksum1 =

    struct with fields:
    
        Value: [4×1 uint32]
        MarkedUnique: 0

chksum1_details =

    struct with fields:
    
        ContentsChecksum: [1×1 struct]
        InterfaceChecksum: [1×1 struct]
        ContentsChecksumItems: [359×1 struct]
        InterfaceChecksumItems: [60×1 struct]

Input Arguments

subsys — Name or handle of nonvirtual subsystem
character vector
Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: char

Output Arguments

**checksum** — A structure that stores the value of the checksum and indicates whether subsys contains unique block or subsystem properties which prevent generated code reuse

structure

Checksum information, returned as a structure with the fields:

**Value** — Array of four 32-bit integers that represents the subsystem's 128-bit checksum

4x1 uint32

**MarkedUnique** — True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false

bool

**details** — A structure that stores checksum data on model contents and the interface

structure

Checksum information, returned as a structure with the fields:

**ContentsChecksum** — A structure of the same form as checksum, representing a checksum that provides information about all blocks in the system

structure

**InterfaceChecksum** — A structure of the same form as checksum, representing a checksum that provides information about the subsystem's block parameters and connections

structure

**ContentsChecksumItems** — Structure array that Simulink uses to compute the checksum for ContentsChecksum

structure
Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port

char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by get_param(handle, identifier)

type

InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for InterfaceChecksum structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port

char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

Value — Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by get_param(handle, identifier)

type

Simulink.BlockDiagram.getChecksum

Introduced in R2006b
Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

Simulink.suppressDiagnostic(source, message_id)
Simulink.suppressDiagnostic(diagnostic)

Description

Simulink.suppressDiagnostic(source, message_id) suppresses all instances of diagnostics represented by message_id thrown by the blocks specified by source.

Simulink.suppressDiagnostic(diagnostic) suppresses the diagnostics associated with MSLDiagnostic object diagnostic.

Examples

Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the Simulink.suppressDiagnostic function to suppress the parameter precision loss warning thrown by the Constant block, one.

Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
     'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');

Input Arguments

source — Block or model object throwing the diagnostic
block path | block handle
The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

`message_id` — message identifier of diagnostic
message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

`diagnostic` — Diagnostic object
`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

sint

Create Simulink.NumericType object describing signed integer data type

Syntax

a = sint(WordLength)

Description

sint(WordLength) returns a Simulink.NumericType object that describes the data type of a signed integer with a word size given by WordLength.

Note sint is a legacy function. In new code, use fixdt instead. In existing code, replace sint(WordLength) with fixdt(1,WordLength,0).

Examples

Define a 16-bit signed integer data type.

a = sint(16)

a =

NumericType with properties:

    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Signed'
    WordLength: 16
    FractionLength: 0
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''

Introduced before R2006a
slblocksearchdb.trainfrommodel

Train suggestion engine to improve quick insert results based on one model

Syntax

slblocksearchdb.trainfrommodel(model)

Description

slblocksearchdb.trainfrommodel(model) improves quick insert search results based on a single model.

Examples

Use a Single Model for Training

Train the suggestion engine to use a model to improve results. Assume 'MyModels' is in the current folder. This code uses a relative path.

slblocksearchdb.trainfrommodel('MyModels/model.slx')

Input Arguments

model — Model for training the suggestion engine
model path

Model to train the suggestion engine, specified as a character vector or string scalar of the full model path or relative path. Include the .slx or .mdl extension

Example: 'H:/MyModels/model.slx' 'mymodel.slx'

“Improve Quick Block Insert Results”

Introduced in R2018a
slblocksearchdb.trainfrommodelsindir

Train suggestion engine to improve quick insert results based on models in a folder

Syntax

slblocksearchdb.trainfrommodelsindir(folder)
slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)

Description

slblocksearchdb.trainfrommodelsindir(folder) improves search results based on the models in folder, recursively.

slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions) excludes the specified models from updating the suggestion engine.

Examples

Train Suggestion Engine and Exclude Folders and Models

Create the cell array exPath for a folder you want to exclude and a model you want to exclude. To train the suggestion engine, use the cell array in the slblocksearchdb.trainfrommodelsindir command.

exPath = {'MyModels/testmodels' 'MyModels/myvdp.slx'}
slblocksearchdb.trainfrommodelsindir('MyModels','exclude',exPath)
The command uses the models in the folder 'MyModels' with the exclusions you specified.

**Input Arguments**

**folder** — Folder whose models to use for training
folder path

Folder whose models to use for training the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

**exclusions** — Models to exclude from training models
cell array of character vectors | string array

Models to exclude from training the suggestion engine, specified as a cell array of character vectors or a string array. Specify folders or models to exclude as a full or relative path. Model names must include the file extension .slx or .mdl.

Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}

“Improve Quick Block Insert Results”

**Introduced in R2018a**
**slblocksearchdb.untrainall**

Remove the effects of all added models from the suggestion engine

**Syntax**

```
slblocksearchdb.untrainall
```

**Description**

`slblocksearchdb.untrainall` removes the models added to the suggestion engine to improve quick insert results. Use this function when you want to return the database to the default state.

**Examples**

**Add Models and Remove All**

Add some models to the suggestion engine.

```plaintext
slblocksearchdb.trainfrommodelsindir('MyModels')
slblocksearchdb.trainfrommmodel('C:/users/TrainingModels/mymodel.slx')
```

Remove all added models from the suggestion engine.

```plaintext
slblocksearchdb.untrainall
```

Introduced in R2018a
slblocksearchdb.untrainmodel

Remove the effect of a model from the suggestion engine

Syntax

slblocksearchdb.untrainmodel('model')

Description

slblocksearchdb.untrainmodel('model') removes the effects of a single model from the suggestion engine.

Examples

Remove a Model from the Suggestion Engine

Train the suggestion engine to use a model to improve results.

slblocksearchdb.trainfrommodel('MyModels/model.slx')

Remove the model from the suggestion engine.

slblocksearchdb.untrainmodel('MyModels/model.slx')

Input Arguments

model — Model to remove from the suggestion engine
model path

Model whose effects to remove from the suggestion engine, specified as the full or relative path character vector or string scalar. Include the .slx or .mdl extension.

Example: 'H:/MyModels/model.slx'

**slblocksearchdb.untrainmodelsindir**

Remove the effects of models from the suggestion engine

**Syntax**

```matlab
slblocksearchdb.untrainmodelsindir(folder)
slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)
```

**Description**

`slblocksearchdb.untrainmodelsindir(folder)` removes models in `folder` from the suggestion engine, recursively.

`slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

**Examples**

**Remove the Effects of Models from Suggestion Engine**

Create the cell array `exPath` for a folder and a model whose effects you do not want to remove from the suggestion engine. Then use the cell array in the `slblocksearchdb.untrainmodelsindir` command.

```matlab
exPath = {'MyModels/subfolder' 'MyModels/myvdp.slx'}
slblocksearchdb.untrainmodelsindir('MyModels','exclude',exPath)
```
The command removes the models in the folder 'MyModels' with the exclusions you specified.

**Input Arguments**

folder — Folder whose models to remove from the suggestion engine

folder path

Folder whose models to remove from the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

exclusions — Folders and models to exclude from removing

cell array of character vectors | string array

Folders or models to exclude from removing from the suggestion engine, specified as a cell array of character vectors or a string array. Specify the folders or models to exclude as a full or relative path. For models, include the .slx or .mdl extension.

Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/myvdp.slx'}

slbuild

Build standalone executable or model reference target for model

Syntax

slbuild(model)
slbuild(model,buildSpec)
slbuild(model,buildSpec,Name,Value)

Description

slbuild(model) builds a standalone Simulink Coder binary executable file from model, using the current model configuration settings. If the model has not been loaded, slbuild loads it before initiating the build process.

Do not use rtwbuild, rtwrebuild, or slbuild commands with parallel language features (Parallel Computing Toolbox), for example, within a parfor or spmd loop. For information about parallel builds of referenced models, see “Reduce Build Time for Referenced Models by Using Parallel Builds” (Simulink Coder).

You cannot use slbuild to build subsystems.

slbuild(model,buildSpec) builds a standalone Simulink Coder binary executable file from model according to the specified code generation action.

slbuild(model,buildSpec,Name,Value) builds a standalone Simulink Coder binary executable file from model as specified by one or more Name,Value pairs.

Examples

Generate Code and Build Executable Image for Model

Generate C code for model rtwdemo_rtwintro.
slbuild('rtwdemo_rtwintro')
% Same operation as ...
% slbuild('rtwdemo_rtwintro','StandaloneCoderTarget')

For the generic real-time (GRT) target, the coder generates these code files and places them in folders rtwdemo_rtwintro_grt_rtw and slprj/grt/_sharedutils.

<table>
<thead>
<tr>
<th>Model Files</th>
<th>Shared Files</th>
<th>Interface Files</th>
<th>Other Files</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtwdemo_rtwintro.c</td>
<td>rtwtypes.h</td>
<td>rtmodel.h</td>
<td>none</td>
</tr>
<tr>
<td>rtwdemo_rtwintro.h</td>
<td>multiword_types.h</td>
<td></td>
<td></td>
</tr>
<tr>
<td>rtwdemo_rtwintro_private.h</td>
<td>builtin typeid types.h</td>
<td></td>
<td></td>
</tr>
<tr>
<td>rtwdemo_rtwintrotypes.h</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the following model configuration parameters settings apply, the coder generates additional results.

<table>
<thead>
<tr>
<th>Parameter Setting</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Code Generation &gt; Generate code only</strong> pane is cleared</td>
<td>Executable image rtwdemo_rtwintro.exe</td>
</tr>
<tr>
<td><strong>Code Generation &gt; Report &gt; Create code generation report</strong> is selected</td>
<td>Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores</td>
</tr>
</tbody>
</table>

**Clean Top Model Build**

Clean the model build area enough to trigger regeneration of the top model code at the next build.

slbuild('rtwdemo_rtwintro','CleanTopModel')
**Force Top Model Build**

Generate code and build an executable image for `rtwdemo_mdlreftop`, which refers to model `rtwdemo_mdlrefbot`, regardless of model checksums and parameter settings.

```
slbuild('rtwdemo_mdlreftop','StandaloneCoderTarget', ... 'ForceTopModelBuild',true)
```

**Input Arguments**

**model** — Specifies model for the build process

*handle | character vector*

Model for which to build a standalone executable or model reference target, specified as a handle or a character vector representing the model name.

Example: `gcs`

**buildSpec** — Specifies the code generation action for the build process

*`'StandaloneCoderTarget'` (default) | `'ModelReferenceSimTarget'` | `'ModelReferenceCoderTarget'` | `'ModelReferenceCoderTargetOnly'` | `'CleanTopModel'`*

`buildSpec` directs the code generator to perform the selected build action for the model and build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build a model reference simulation target only.

The `buildSpec` argument must be one of the following.

<table>
<thead>
<tr>
<th><code>buildSpec</code></th>
<th>Build Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'StandaloneCoderTarget'</code></td>
<td>Builds a standalone Simulink Coder binary executable file from <code>model</code>, using the current model configuration settings. If <code>model</code> has not been loaded, <code>slbuild</code> loads it before initiating the build process.</td>
</tr>
<tr>
<td>buildSpec</td>
<td>Build Action</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>'ModelReferenceSimTarget'</td>
